AFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2877S**

CARBURETER SPECIFICATIONS

For Buick 8 Cylinder 364 Cu. In. Engine: Vacuum at Idle 16 to 17 Inches

Dimensions: Flange four bore—4 bolt type
Throttle bore primary, 1 9/16 inch secondary 1 11/16 inch I D
Primary venturi size primary side 7/16 inch secondary side 11/32 inch I D
Main venturi size primary side 1¼ inch secondary side 1 9/16 inch I D

Vents: Inside (4) in air horn Outside (5) in air horn (4) in body

Low Speed Circuit: (Primary side only) Jet size No 56 (.0465 inch) drill
By-pass, size No 54 (.055 inch) drill
Economizer size No 60 (.040 inch) drill
Idle bleed size (.053 inch) diameter
Idle port slot type length .200 inch, width .030 inch

Idle Port Opening: .156 to .162 inch above top edge of valve with valve tightly closed

Set Idle Adjustment Screw: ¼ to 1¾ turns open For richer mixture turn screw out Do not idle engine below 475 r p m Automatic transmission in neutral, 550 r p m for cars with air conditioning

Main Nozzle: Installed permanently DO NOT REMOVE Anti percolator bleed primary (tube in venturi assembly) size No 70 (.028 inch) drill Secondary (drilled hole in venturi assembly) size No 60 (.040 inch) drill

Secondary Initial Discharge (In venturi assembly secondary side only)
Pick up tube size No 60 (.040 inch) drill
Air bleed size (.0275 inch) diameter
Discharge port size (.051 inch) diameter

Accelerating Pump: Discharge jet (twin) primary side only size No 70 (.028 inch) drill Intake ball check seat (screw plug) size .115 to .120 inch diameter Discharge needle seat size No 50 (.070 inch) drill

Choke: Carter Climatic® Control set one point rich Butterfly type—offset choke valve primary side only Choke heat suction hole restriction in body size (.078 inch) diameter

Vacuum Spark Port: Horizontal slot (round end) .040 x .130 inch Bottom of port .008 to .016 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter

Spark Plug Gap .033"	Breaker Point Setting .015"	Ignition Timing Breaker Points to Open: 12° B. T. D. C. At Vibration Damper	Float Setting 7/32 Inch (Use Gauge T109-106)	Idle Adjustment Screw Setting ¼ to 1¾ Auto. Trans. 475 R.P.M. In Neutral

NOTE: These cars are equipped with Hydraulic Valve Lifters — NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Procedure Form 3701

FLOAT ALIGNMENT: Side of floats parallel to edge of casting Minimum clearance between lever and air horn lugs without binding To adjust, bend float lever

FLOAT LEVEL: 7/32 inch (Gauge T109 106) between top of floats (at outer end) and air horn gasket To adjust bend float lever

FLOAT DROP: 23/32 inch between top of floats (at outer end) and air horn gasket To adjust bend stop tabs on float brackets

PUMP: 33/64 inch from the top of the bowl cover to the top of the plunger shaft To adjust, bend throttle connector rod

CHOKE PISTON LEVER ADJUSTMENT: 010 inch (Gauge T109-200) between choke lever and stop in piston housing with choke valve closed To adjust, bend choke connector rod

FAST IDLE LINKAGE ADJUSTMENT: With slight clearance between lug on fast idle cam and stop on flange casting and inner choke shaft lever contacting lug on outer choke shaft lever align index mark on cam with adjusting screw To adjust, bend fast idle con nector rod

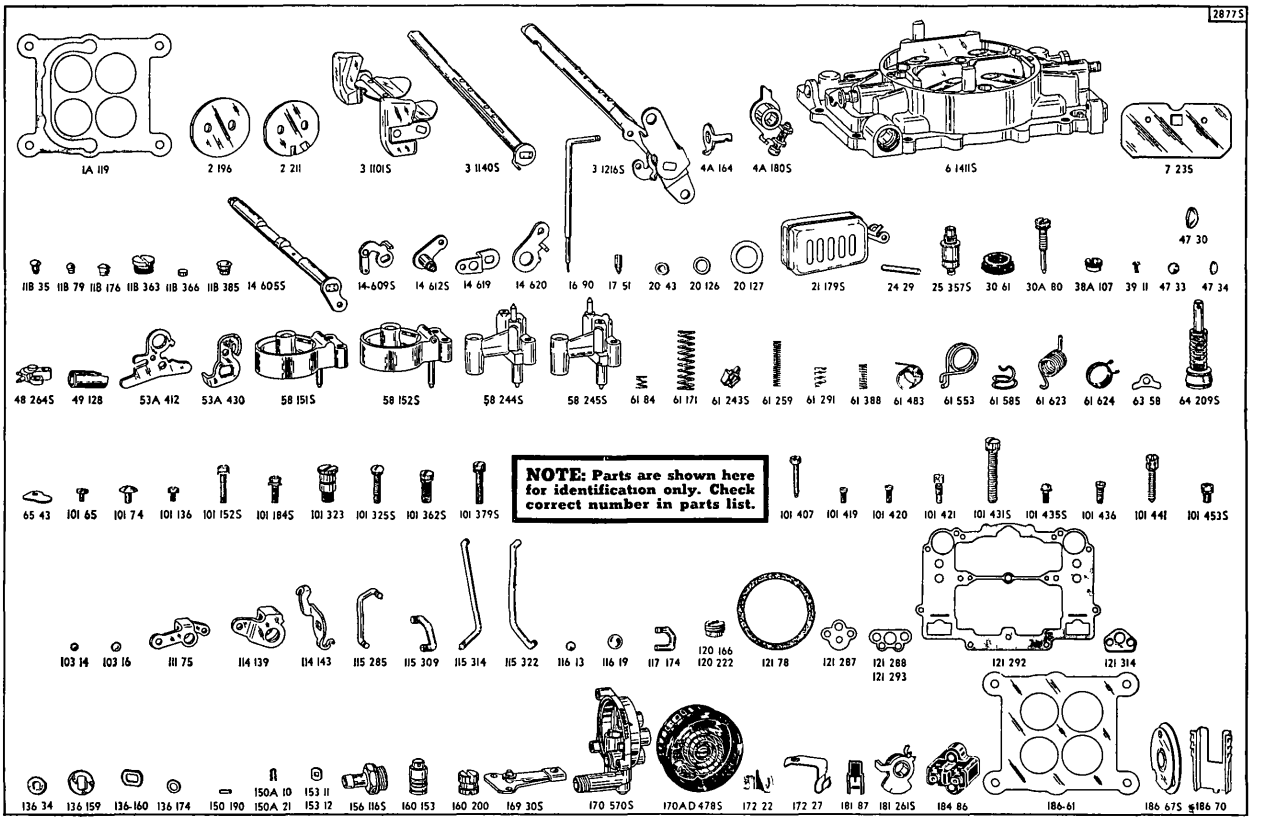
FAST IDLE THROTTLE VALVE CLEARANCE: 020 inch (Gauge T109 29) between lower edge of valve and bore with adjusting screw on index mark of cam

FAST IDLE ON CAR: 1500 R P M hot engine with fast idle screw on index mark of cam

UNLOADER: 3/16 inch (Gauge T109 28) between upper edge of choke valve and inner wall of air horn To adjust bend unloader lip on throttle lever

SECONDARY THROTTLE LEVER ADJUSTMENT: 1 Primary and secondary throttle valves must reach wide open position at the same time. To adjust, bend secondary operating rod **NOTE:** Secondary throttle valves will be a few degrees from wide open when primary valves are wide open Upper edge of secondary valve should just contact auxiliary valve when auxiliary valve is wide open **IMPORTANT:** The wide open stop lug on secondary throttle lever should contact boss on flange to prevent secondary valves from going past wide open If necessary bend stop lug 2 With primary and secondary throttle valves tightly closed there should be 010 to 030 inch gauge T109-29 between positive closing shoes on primary and secondary throttle levers To adjust, bend shoe on secondary lever

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve Tang on secondary throttle lever should freely engage in notch of lock-out dog To adjust bend tang on secondary throttle lever



CAR STARTER SWITCH ADJUSTMENT: Should con tact between 19/64 inch and 9/16 inch travel of top edge of throttle lever stop lug and idle speed screw (Idle speed screw just touching stop lug with valve seating)

To adjust, add or remove shims from switch

TOOLS REQUIRED FOR SERVICING CARBURETER:

T109-28	3/16" Unloader gauge	T109 106	7/32' Float gauge
T109-29	020" Wire gauge	T109-200	010" Wire gauge

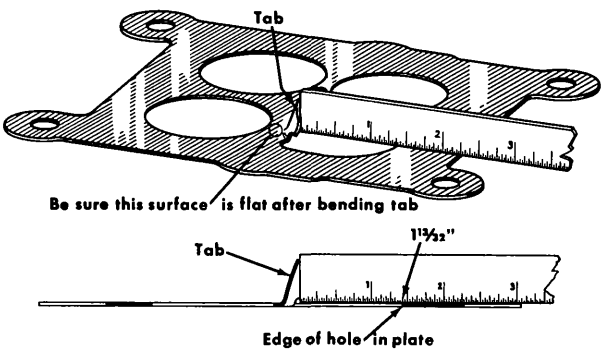
GENERAL BULLETIN

ALL CARBURETER ACCOUNTS



BULLETIN NO. 26 BUICK
DATE March 16, 1959

SUBJECT: 1959 BUICK V8

ENGINE ROUGHNESS ON ACCELERATION
AFB-2840S (4 BORE) CARBURETER

Two modifications have been approved:

1. A thin steel baffle plate is located between the carbureter flange and the intake manifold gasket. It protects the aluminum carbureter castings from the corrosive effect of exhaust gases. The baffle is a part of the "de-icer" system. A deflector tab on the baffle extends into the left primary bore of the intake manifold. (see illustration). The purpose of the baffle tab is to aid fuel distribution in the intake manifold. The tab is correctly positioned when it is 20° from vertical in relation to the flat surface of the plate.

   Earlier production deflector tabs may be reformed if care is exercised. The 20° angle may be secured by bending the tab until the distance from the top of the tab to the opposite side of the bore hole is 1 13/32" measured as illustrated. Clamp the plate in a vise while reforming. Make certain the baffle plate is flat before reinstalling. A good gasket seal is important.

   The baffle plate with this dimension went into production November 26th on Buicks starting with Engine Production Code No. 4F96981.

2. A change has been made in the step-up rod and step-up piston spring to provide a slightly richer mixture to improve light part throttle acceleration. The new rod is stamped 16-82X. The new step piston spring 61-259 is slightly stronger than the original 61-246 spring.

   Step-up rods stamped 16-82 (without the "X") in field stocks should be returned to your Carter supplier for replacement. The 61-246 spring has many other applications on current model carbureters. An initial shipment of a limited quantity of parts 16-82X and 61-259 is being made to Carter Central Distributors. Carter warranty applies.

Insufficient intake manifold temperatures can cause a similar engine roughness on accelerations. The manifold heat valve should be checked as follows:

1. The heat valve shaft must be free. Lubricate with a mixture of kerosene and graphite if necessary.

2. Make certain that the spring steel stop is not bent, allowing the valve to travel past the open or closed position.

3. The thermostatic coil spring should have about 180° wrap with the valve in the closed position and the thermostat at room temperature (70° F.).

DETONATION COMPLAINTS ON LIGHT THROTTLE ACCELERATION LE SABRE SERIES 4400 2 BORE APPLICATION

This complaint is sometimes confused with carbureter malfunction. The correction involves a slight reduction in the spark advance supplied by the distributor vacuum advance unit.

A special service distributor vacuum advance mechanism part number 1116155 has been released by Buick. This change will apply for service only where this complaint is encountered. It is important that the initial spark timing be set at 12° and premium fuel be used with this engine.

FUEL LINE OBSTRUCTION - ALL MODELS

The synthetic rubber hose fuel line should be inspected for damage when investigating complaints indicating fuel starvation. Examine the hose for "pinched" conditions at the supporting clamps. Check to be sure the hose is not flattened by being pulled too tightly around one or more of its bends under the car.

Bending or repositioning the clamps and relocating the slack in the line will usually correct these conditions on a new car where the hose has not taken a permanent set.

R. J. Mullin
Service Supervisor

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Procedure Form 3701

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 7/32 inch (Gauge T109-106) plus or minus 1/64 inch between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP. 23/32 inch plus or minus 1/16 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 33/64 inch from the top of the bowl cover to the top of the plunger shaft. To adjust, bend throttle connector rod.

CHOKE PISTON LEVER ADJUSTMENT: .010 inch (Gauge T109-200) between choke lever and stop in piston housing with choke valve closed. To adjust, bend choke connector rod. NOTE: Choke valve should be held closed by applying pressure to piston lever in piston housing.

FAST IDLE LINKAGE ADJUSTMENT: With choke valve closed index mark on cam should align with adjusting screw. To adjust, bend fast idle connector rod.

NOTE: It may be necessary to bend stop lug on fast idle cam.

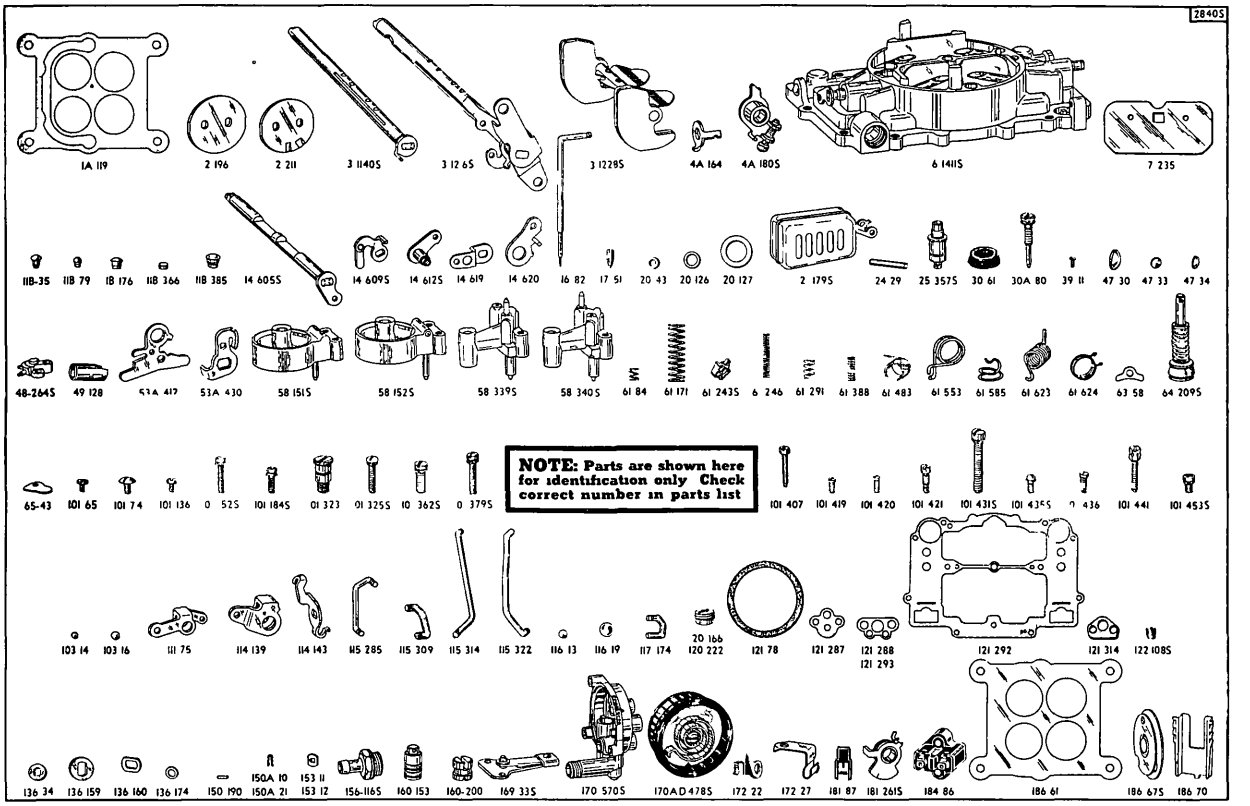
FAST IDLE THROTTLE VALVE CLEARANCE: .020 inch (Gauge T109-29) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 1500 R.P.M. hot engine with fast idle screw on index mark of cam.

UNLOADER: 3/16 inch (Gauge T109-28) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Primary and secondary throttle valves must reach wide open position at the same time. To adjust, bend secondary operating rod. NOTE: Secondary throttle valves will be a few degrees from wide open when primary valves are wide open. Upper edge of secondary valve should just contact auxiliary valve when auxiliary valve is wide open. **IMPORTANT:** The wide open stop lug on secondary throttle lever should contact boss on flange to prevent secondary valves from going past wide open. If necessary bend stop lug.

2. With primary and secondary throttle valves tightly closed, there should be .010 to .030 inch (gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.



SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.

CAR STARTER SWITCH ADJUSTMENT: Should contact between 19/64 inch and 9/16 inch travel to top edge of throttle lever stop lug and idle speed screw. (Idle speed screw just touching stop lug with valve seating.) To adjust, add or remove shims from switch.

WGD Dual Down-Draft Climatic® Control **Carbureters Nos. 2837S-2838S**

CARBURETER SPECIFICATIONS

For Buick 8 Cylinder 364 Cu. In. Engine: Vacuum at Idle 16 Inches

Dimensions· Flange size 1¼ inch dual 4 bolt type
Primary venturi 11/32 inch I D
Main venturi 1 3/16 inch I D

Vents Outside bowl cover—one flange—two

Low Speed Circuit· Jet size (2837S) No 69 (0292 inch) (2838S) No 71 (026 inch) drill By pass in air horn (057 inch) diameter Economizer in air horn (061 inch) diameter Idle bleed in air horn No 50 (070 inch) drill Idle port slot type length 150 inch width 030 inch

Idle Port Opening: 087 to 093 inch above top edge of valve with valve tightly closed

Set Idle Adjusting Screw. ¾ to 2 turns open For richer mixture turn screw out Idle engine at 475 R P M Auto Trans in neutral 475 R P M Std Trans For cars with air conditioning idle engine at 550 R P M in neutral

Main Nozzle Nozzle is installed permanently DO NOT REMOVE Anti percolating well bleed in plug size No 70 (028 inch) drill

Accelerating Pump: Discharge jet (twin) size No 68 (031 inch) Intake check seat size 115 to 120 inch diameter Discharge (needle seat) size No 50 (070 inch) drill Pump jet air bleed passage to outside ⅛ inch drill

Choke Carter Climatic® Control—(2837S) set 1 point lean (2838S) set on index Butterfly type offset valve Choke heat suction hole plug between air horn and piston housing size (2837S) No 42 (0935 inch), (2838S) No 48 (076 inch) drill

Vacuum Spark Port: Horizontal slot type 130 by 040 inch Bottom of port to be 010 to 016 inch above upper edge of valve with valve tightly closed

Motor Tune-Up — Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .033"	Breaker Point Setting .015"	Ignition Timing Breaker Points to Open: 12° B. T. D. C. At Vibration Damper	Float Setting ¼ Inch (Use Gauge T109-31)	Idle Adjustment Screw Setting ¾ to 2 Auto. Trans. 475 R. P. M. Std. Trans. 475 R. P. M.

NOTE: These cars are equipped with Hydraulic Valve Lifters — NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3643

Float Level: ¼ inch (Gauge T109 31) between top of float (at center) and bowl cover To adjust bend float lever

Float Alignment. Side of float parallel to edge of casting Minimum clearance between lever and air horn lugs without binding To adjust bend float lever

Pump· With pump connector link in outer hole (long stroke) flat on pump arm should parallel straight edge on dust cover boss To adjust bend throttle connector rod

Metering Rod Metering rod should bottom with throttle valves seated

Choke Lever Clearance· With slight clearance between tang on fast idle cam and stop on flange casting and inner choke shaft lever contacting lug on outer choke shaft lever align index mark on cam with adjusting screw To adjust bend lug on outer choke shaft lever

Fast Idle Throttle Valve Clearance 026' (Gauge T109 189) between lower edge of valve and bore with adjusting screw on high step of cam

Fast Idle on Car 1500 R P M hot engine with fast idle screw on index mark of cam

Unloader: 3/16" (Gauge T109 28) between top edge of valve and inner wall of air horn To adjust bend unloader arm on throttle lever

Car Starter Switch: Should contact between 31/64" and 11/16 travel to top edge of throttle lever stop lug and idle speed screw (Idle speed screw just touching stop lug with valve seating) To adjust add or remove shims from switch

AFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2800S**

CARBURETER SPECIFICATIONS

For Buick 8 Cylinder 364 Cu. In. Engine· Vacuum at Idle 14 to 15 Inches

Dimensions: Flange four bore—4 bolt type
Throttle bore primary, 1-9/16 inch, secondary 1-11/16 inch I D
Primary venturi size primary side, 7/16 inch, secondary side, 11/32 inch I D
Main venturi size primary side 1¼ inch, secondary side, 1 9/16 inch I D

Vents Inside (4) in air horn Outside (5) in air horn, (4) in body

Low Speed Circuit· (Primary side only) Jet size No 56 (0465 inch) drill
By pass size No 54 (055 inch) drill
Economizer size No 61 (039 inch) drill
Idle bleed size (053 inch) diameter
Idle port slot type length 200 inch, width 030 inch

Idle Port Opening: 156 to 162 inch above top edge of valve with valve tightly closed.

Set Idle Adjustment Screw: ¼ to 1¾ turns open For richer mixture turn screw out Do not idle engine below 475 r p m Automatic transmission in neutral, 550 r p m for cars with air conditioning

Main Nozzle: Installed permanently DO NOT REMOVE Anti-percolator bleed, primary, (tube in venturi assembly) size No 70 (028 inch) drill Secondary, (drilled hole in venturi assembly) size No 60 (040 inch) drill

Secondary Initial Discharge: (In venturi assembly secondary side only)
Pick up tube size No 60 (040 inch) drill
Air bleed, size (0275 inch) diameter
Discharge port size (051 inch) diameter

Accelerating Pump: Discharge jet (twin) primary side only size No 70 (028 inch) drill Intake ball check seat (screw plug) size 115 to 120 inch diameter Discharge needle seat size No 50 (070 inch) drill

Choke: Carter Climatic® Control set one point rich Butterfly type—offset choke valve primary side only Choke heat suction hole restriction in body size (0807 inch) diameter

Vacuum Spark Port: Horizontal slot (round end) 040 x 130 inch Bottom of port 008 to 016 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .033"	Breaker Point Setting .015"	Ignition Timing Breaker Points to Open: 5° B. T. D. C. At Vibration Damper	Float Setting 7/32 Inch (Use Gauge T109-106)	Idle Adjustment Screw Setting ¼ to 1¾ Auto. Trans. 475 R.P.M. In Neutral

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Procedure Form 3701

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 7/32 inch (Gauge T109-106) between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 33/64 inch from the top of the bowl cover to the top of the plunger shaft. To adjust, bend throttle connector rod.

CHOKE PISTON LEVER ADJUSTMENT: .045 inch (Gauge T109-158) between choke lever and stop in piston housing with choke valve closed. To adjust, bend choke connector rod.

FAST IDLE LINKAGE ADJUSTMENT: With slight clearance between lug on fast idle cam and stop on flange casting, and inner choke shaft lever contacting lug on outer choke shaft lever align index mark on cam with adjusting screw. To adjust, bend fast idle connector rod.

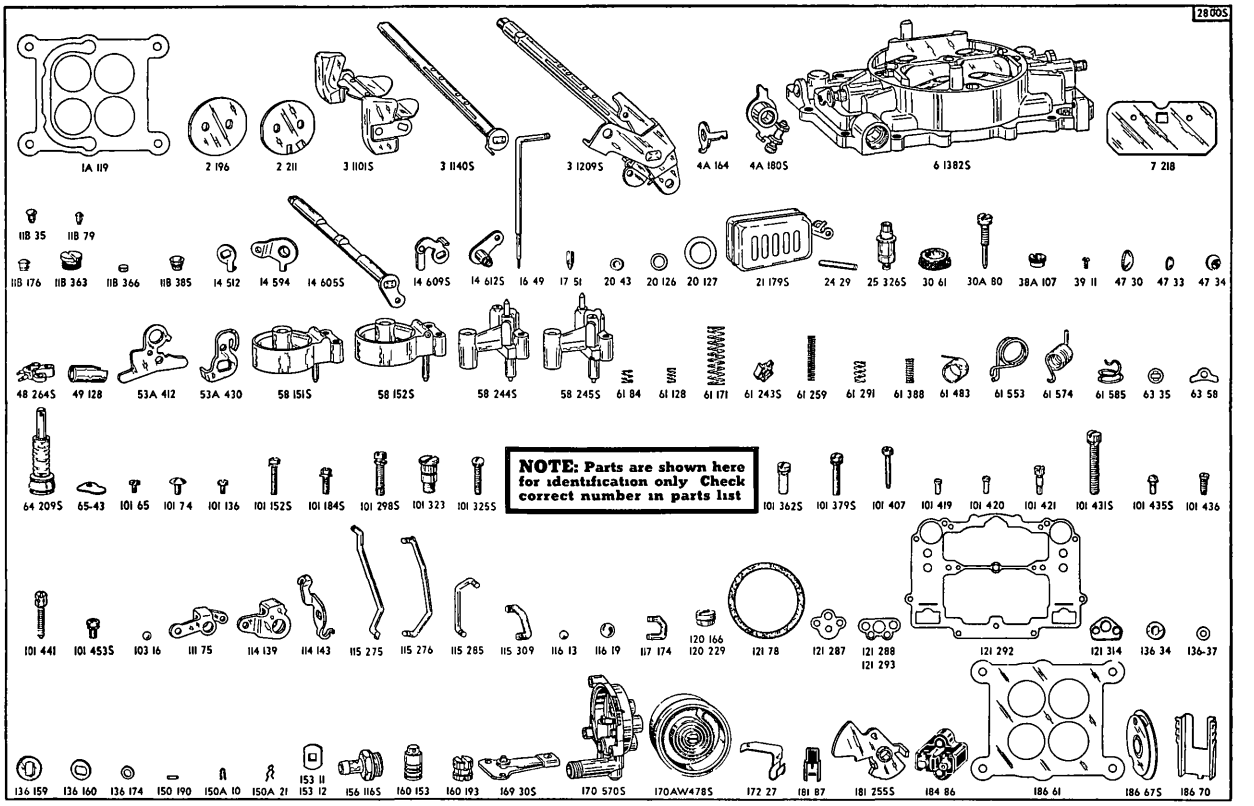
FAST IDLE THROTTLE VALVE CLEARANCE: .020 inch (Gauge T109-29) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 1500 R.P.M. hot engine with fast idle screw on index mark of cam.

UNLOADER: 3/16 inch (Gauge T109-28) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Primary and secondary throttle valves must reach wide open position at the same time. To adjust, bend secondary operating rod. **NOTE:** Secondary throttle valves will be a few degrees from wide open when primary valves are wide open. Upper edge of secondary valve should just contact auxiliary valve when auxiliary valve is wide open. **IMPORTANT:** The wide open stop lug on secondary throttle lever should contact boss on flange to prevent secondary valves from going past wide open. If necessary bend stop lug. 2. With primary and secondary throttle valves tightly closed, there should be .010 to .030 inch gauge T109-29 between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.



CAR STARTER SWITCH ADJUSTMENT: Should contact between 19/64 inch and 9/16 inch travel of top edge of throttle lever stop lug and idle speed screw. (Idle speed screw just touching stop lug with valve seating.)

To adjust, add or remove shims from switch.

TOOLS REQUIRED FOR SERVICING CARBURETER:

(2675S-2845S) DYNAFLOW TRANSMISSION

WGD Dual Down-Draft Climatic® Control Carbureters Nos. 2674S-2675S-2845S

CARBURETER SPECIFICATIONS

For Buick 8 Cylinder 364 Cu. In. Engine: Vacuum at Idle (2674S) 17.0 Inches; (2675S-2845S) 14 to 15 Inches

Dimensions: Flange size 1¼ inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Vents: Outside, bowl cover—one, flange—two.

Low Speed Circuit: Jet, size (2674S) No. 69 (.0292 inch), (2675S-2845S) No. 71 (.026 inch) drill. By-pass, in air horn, (.057 inch) diameter. Economizer, in air horn, (.061 inch) diameter. Idle bleed, in air horn, No. 50 (.070 inch) drill. Idle port, slot type, length .150 inch; width .030 inch.

Idle Port Opening: .087 to .093 inch above top edge of valve with valve tightly closed.

Set Idle Adjusting Screw: ¾ to 2 turns open. For richer mixture turn screw out. Idle engine at 475 R. P. M. Auto. Trans. in neutral; 450 R. P. M. Std. Trans. For cars with air conditioning idle engine at 550 R. P. M. in neutral.

Main Nozzle: Nozzle is installed permanently. DO NOT REMOVE. Anti-percolating well bleed, in plug, size No. 70 (.028 inch) drill.

Accelerating Pump: Discharge jet (twin) size (2674S) No. 68 (.031 inch), (2675S-2845S) No. 69 (.0292 inch) drill.
Intake check seat size .115 to .120 inch diameter.
Discharge (needle seat) size No. 50 (.070 inch) drill.
Pump jet air bleed passage to outside 1/8 inch drill.

Choke: Carter Climatic® Control—(2674S) set 1 point lean, (2675S-2845S) set on index. Butterfly type, offset valve. Choke heat suction hole plug between air horn and piston housing size (2674S) No. 42 (.0935 inch), (2675S-2845S) No. 48 (.076 inch) drill.

Vacuum Spark Port: Horizontal slot type .130 by .040 inch. Bottom of port to be .010 to .016 inch above upper edge of valve with valve tightly closed.

Motor Tune-Up — Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open:	Float Setting	Idle Adjustment Screw Setting
.030"-.035"	.015"	5° B. T. D. C. At Vibration Damper	¼ Inch (Use Gauge T109-31)	¾ to 2 Auto. Trans. 475 R. P. M. Std. Trans. 450 R. P. M.

NOTE: These cars are equipped with Hydraulic Valve Lifters — NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3643

Float Level: ¼ inch (Gauge T109-31) between top of float (at center) and bowl cover. To adjust: bend float lever.

Float Alignment: Side of float parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust: bend float lever.

Pump: With pump connector link in outer hole (long stroke) flat on pump arm should parallel straight edge on dust cover boss. To adjust: bend throttle connector rod.

Metering Rod: Metering rod should bottom with throttle valves seated.

Choke Lever Clearance: With slight clearance between tang on fast idle cam and stop on flange casting and inner choke shaft lever contacting lug on outer choke shaft lever align index mark on cam with adjusting screw. To adjust: bend lug on outer choke shaft lever.

Fast Idle Throttle Valve Clearance: .026" (Gauge T109-189) between lower edge of valve and bore with adjusting screw on high step of cam.

Fast Idle on Car: 1500 R. P. M. hot engine with fast idle screw on index mark of cam.

Unloader: 3/16" (Gauge T109-28) between top edge of valve and inner wall of air horn. To adjust: bend unloader arm on throttle lever.

Car Starter Switch: Should contact between 31/64" and 11/16" travel to top edge of throttle lever stop lug and idle speed screw. (Idle speed screw just touching stop lug with valve seating.) To adjust: add or remove shims from switch.

AFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2507S**

CARBURETER SPECIFICATIONS

For Buick 8 Cylinder Engine 4 125 Inch Bore, 3 4 Inch Stroke

Dimensions Flange four bore—4 bolt type
Throttle bore primary 1 9/16 inch secondary 1 11/16 inch I D
Primary venturi size primary side 7/16 inch secondary side 11/32 inch I D
Main venturi size primary s de 1¼ inch secondary side 1 9/16 inch I D

Vents Inside (4) in air horn Outside (5) in air horn (4) in body

Gasoline Intake Size No 34 (111 inch) drill hole in needle seat

Low Speed Jet Tube (In venturi assembly primary side only)
Jet size No 69 (0292 inch) drill
By pass size (057 inch) diameter
Econom zer size (0492 inch) diameter
Idle bleed size No 55 (052 inch) drill

Idle Port (Upper) slot type Primary length 200 inch width 030 inch Secondary none

Idle Port Opening Primary 156 to 162 inch above top edge of valve w th valve tightly closed Secondary none

Set Idle Adjustment Screw ¾ to 1¾ turns open For richer mixture turn screw out Do not idle engine below 485 r p m Transm ssion n neutral or park position

Main Nozzle Installed permanently DO NOT REMOVE Anti percolator bleed primary (tube in venturi assembly) size No 70 (028 inch) drill Secondary (drilled hole in venturi as sembly) size No 60 (040 inch) drill

Secondary Initial Discharge (In venturi assembly secondary s de only)
Pick up tube size No 60 (040 inch) drill
Air bleed size (0275 inch) diameter
Discharge port size (051 inch) diameter

Step-Up Rod (Vacumeter type) see parts list for size

Metering Jet Primary size 0935 inch diameter (for step up rod)
Secondary size 0748 inch diameter (no step up rod)

Accelerating Pump Discharge jet (twin) primary side only size No 70 (028 inch) drill Intake ball check seat Iscrew plug) size 115 to 120 inch diameter Discharge needle seat size No 50 (070 inch) drill

Choke Carter Climatic® Control set on index Butterfly type—offset choke valve primary side only Choke heat suction hole restriction in body size No 48 (076 inch) drill

Vacuum Spark Port Horizontal slot (round end) 040 x 130 inch Early prod with valve 2 186 bottom of port 000 to 010 inch Late prod with valve 2 211 bottom of port 008 to 016 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open	Float Setting	Idle Adjustment Screw Setting
030"- 035"	125" 175" (or 30 degrees dwell)	5° B T D C At Vibration Damper (Distributor disconnected engine idling below 400 R P M)	7/32 Inch (Use Gauge T109-106)	¾ to 1¾ Turns Open 485 R P M In Neutral or Park Position

NOTE These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3701

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 7/32 inch (Gauge T109-106) between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 33/64 inch from the top of the bowl cover to the top of the plunger shaft. To adjust, bend throttle connector rod.

CHOKE PISTON LEVER ADJUSTMENT: .045 inch (Gauge T109-158) between choke lever and stop in piston housing with choke valve closed. To adjust, bend choke connector rod.

CHOKE SHAFT LEVER ADJUSTMENT: .010 inch (Gauge T109-200) between lug on outer choke shaft lever and stop on inner choke shaft lever with choke valve tightly closed and fast idle cam against stop on casting. To adjust, bend fast idle connector rod. Optional adjustment (late prod.) with slight clearance between lug on fast idle cam and stop on flange casting, and inner choke shaft lever contacting lug on outer choke shaft lever align index mark on cam with adjusting screw. To adjust bend fast idle connector rod.

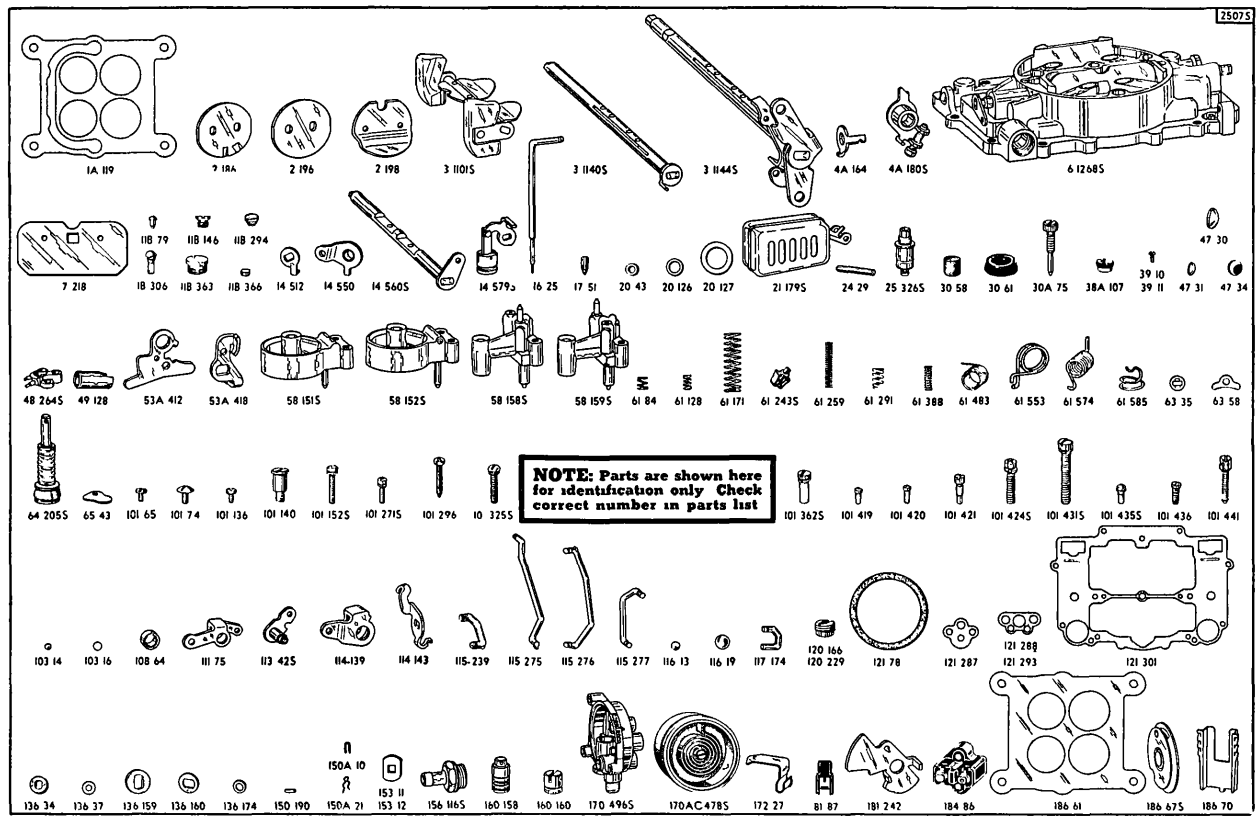
FAST IDLE THROTTLE VALVE CLEARANCE: .026 inch (Gauge T109-189) between lower edge of valve and bore with adjusting screw on high step of cam.

FAST IDLE ON CAR: 1500 R.P.M. hot engine with fast idle screw on high step of cam.

UNLOADER: 3/16 inch (Gauge T109-28) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Primary and secondary throttle valves must reach wide open position at the same time. To adjust, bend secondary operating rod. **NOTE:** Secondary throttle valves will be a few degrees from wide open when primary valves are wide open. Upper edge of secondary valve should just contact auxiliary valve when auxiliary valve is wide open. **IMPORTANT:** The wide open stop lug on secondary throttle lever should contact boss on flange to prevent secondary valves from going past wide open. If necessary bend stop lug. 2. With primary and secondary throttle valves tightly closed, there should be .017 to .022 inch gauge T109-29 between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.



CAR STARTER SWITCH ADJUSTMENT: Should contact between 19/64 inch and 9/16 inch travel of top edge of throttle lever stop lug and idle speed screw. (Idle speed screw just touching stop lug with valve seating.)

To adjust, add or remove shims from switch.

TOOLS REQUIRED FOR SERVICING CARBURETER:

153-12	Switch contact spring shim (006)	(2)
156-116S	Fuel inlet fitting	
160-125	Choke piston (use with 14 581S)	
160-153	Step up piston	(2)
160-158	Step up piston (Sup by 160 153)	(2)
160-160	Choke piston (Use with 14 581S) (Sup by 160 125)	
160-175U	★Unitized package (consists of 1—53A 419 1—61 602 and 1—160 125) (Sup by 160 187U)	
160-187U	★Unitized package (Consists of 1—53A 430 1—61 602 and 1—160 125)	
170-496S	Piston housing and plug assembly	
170AC478S	Thermostatic coil and housing assembly	
170AR478S	Thermostatic coil and housing assembly (Sup by 170AC478S)	
172-27	Cable clip	
181-87	Switch guide block	
181-242	Fast idle cam	
184-86	Switch terminal cap	
186-61	FLANGE BAFFLE PLATE	
186-67S	Choke baffle plate assembly	
186-70	Fuel bowl baffle	(2)
192-38U	Carter starter switch unit	

*Used to correct excessive spark port vacuum at idle on early production carbureters in place of 2 186

†For Canadian use only

★To correct stumble and choke loading

NOTE **Figures in parentheses indicate number of pieces used in one carbureter. Where no figure is shown, only one is used.**

Form 3701B
November, 1956
Revised September, 1957

CARTER MODEL AFB CARBURETER FOR BUICK
(SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the base of the carbureter, when requesting specification pages.

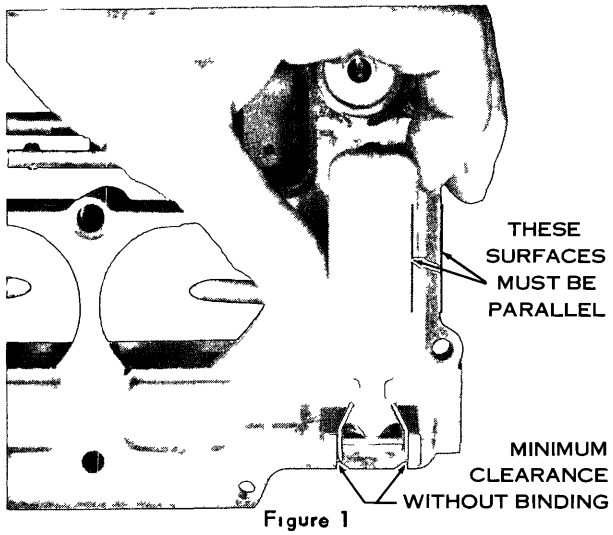

Figure 1

FLOAT ALIGNMENT ADJUSTMENT (Fig. 1):

1. Sight down the side of the float shell to determine if the side of the float is parallel to the outer edge of the air horn casting. TO ADJUST: Bend float lever by applying pressure to the end of the float shell with the fingers while supporting the float lever with the thumb.

   CAUTION: To avoid damaging the float, apply only enough pressure to bend float lever.

2. After aligning float, remove as much clearance as possible between arms of float lever and lugs on air horn by bending the float lever. Arms of float lever should be as parallel to the inner surfaces of lugs on air horn as possible.

   Floats must operate freely without excess clearance on its hinge pin.

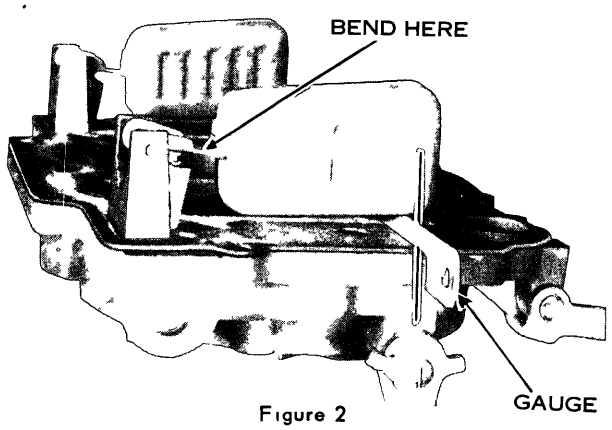

Figure 2

FLOAT LEVEL ADJUSTMENT (Fig. 2):

With air horn inverted, bowl cover gasket in place and needle seated, the clearance between top of float (at outer end) and air horn gasket should be as listed on carburetor specification page. To adjust, bend float arm. Adjust both floats. Recheck float alignment.

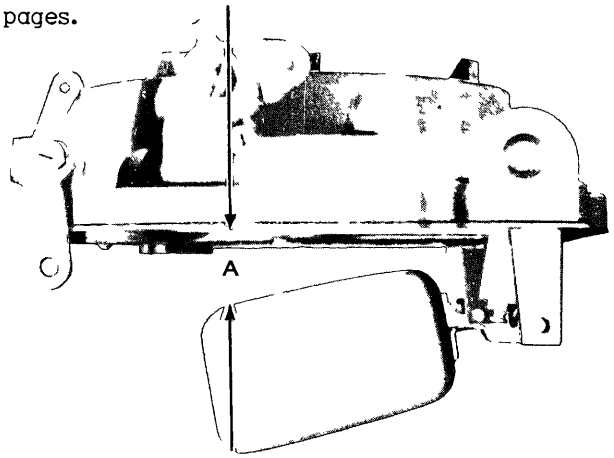

Figure 3

FLOAT DROP ADJUSTMENT (Fig. 3):

With bowl cover held in upright position and measuring from outer end of each float, the distance between tip of floats and bowl cover gasket should be as listed on carbureter specification page. To adjust, bend tabs on float brackets.

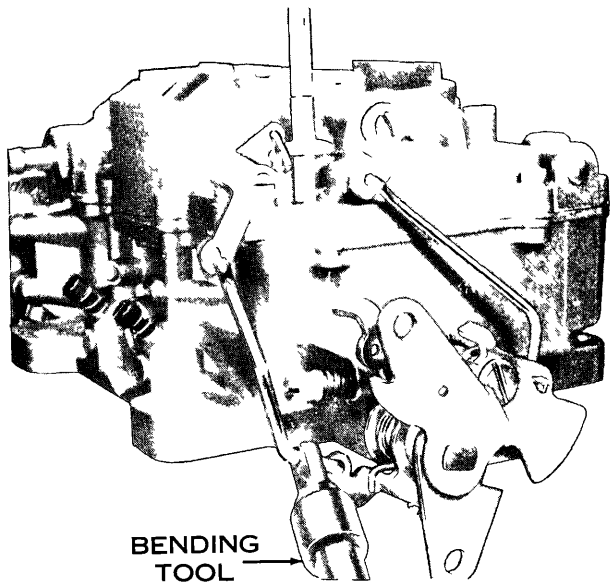

Figure 4

PUMP ADJUSTMENT (Fig. 4):

1. Back out idle speed screw until throttle valves seat in bores of carbureter. NOTE: Be sure choke is wide open so fast idle cam does not hold throttle valve open.

2. The distance from the top of the bowl cover to the top of the plunger shaft should be as listed on carburetor specification page.

3. Adjust by bending throttle connector rod at lower angle (use tool T109-213).

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

S S PRINTED IN USA

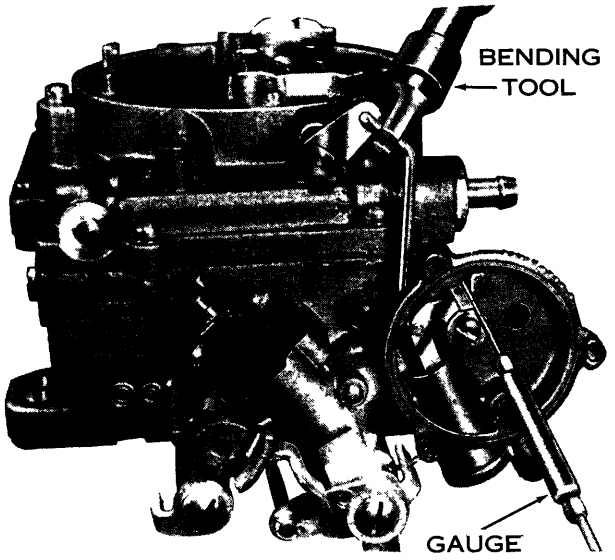

Figure 5

CHOKE PISTON LEVER ADJUSTMENT (Fig. 5):

With ch ke valv tightly closed, the clearance between ch k l ver and stop in piston housing should be as list d n carbureter specification page. To adjust, bend ch k c nnect r rod (use tool T109-213).

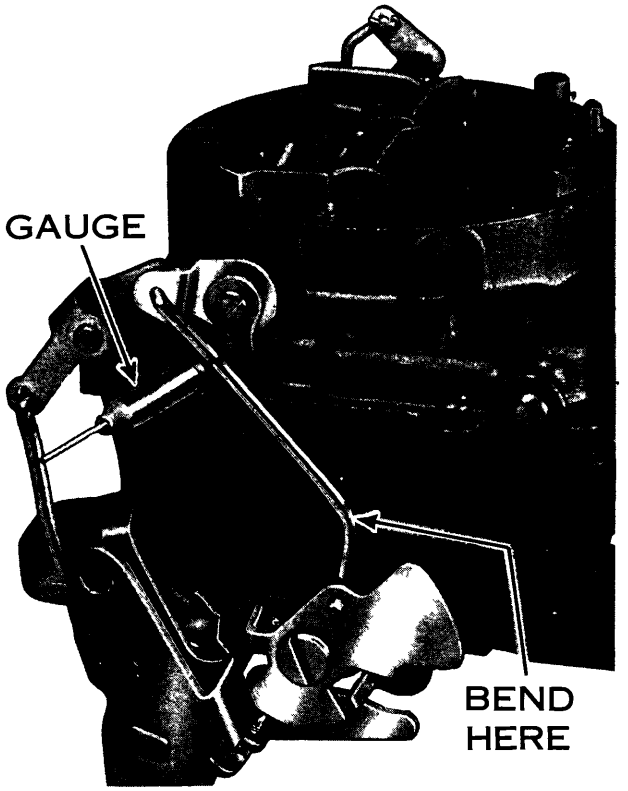

Figure 6

CHOKE SHAFT LEVER ADJUSTMENT (Fig. 6):

With ch k valve tightly closed and fast idle cam against stop on casting, the cl aranc between lug on ut r choke shaft lev r and stop on inner chok shaft lever sh uld b as list d n carbur ter specificati n pag . To adjust, b nd fast idle conn ctor rod (us tool T109-213).

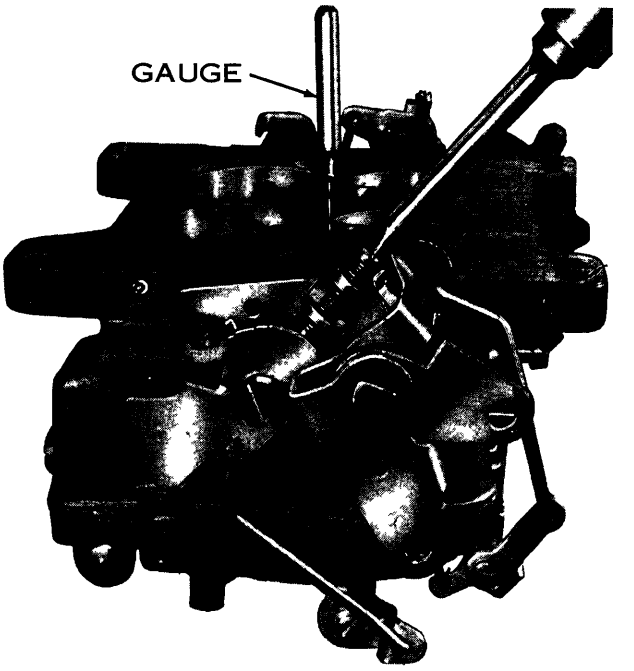

Figure 7

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 7):

With choke valve tightly closed, tighten fast idle adjusting screw (on high step of cam) until the clearance between throttle valve and bore of carbureter, side opposite idle port, is as listed on carbureter specification page.

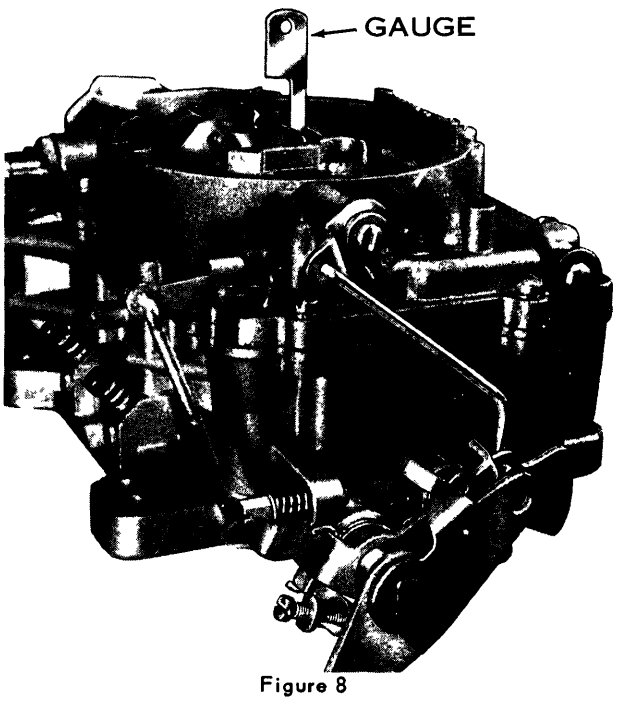

Figure 8

UNLOADER ADJUSTMENT (Fig. 8):

With throttle wide open, the clearance between upp r edge of choke valve and inner wall of air horn should be as listed on carbureter specification pag . To adjust, bend unloader lip on throttle shaft lever. (Use tool T109-41.)

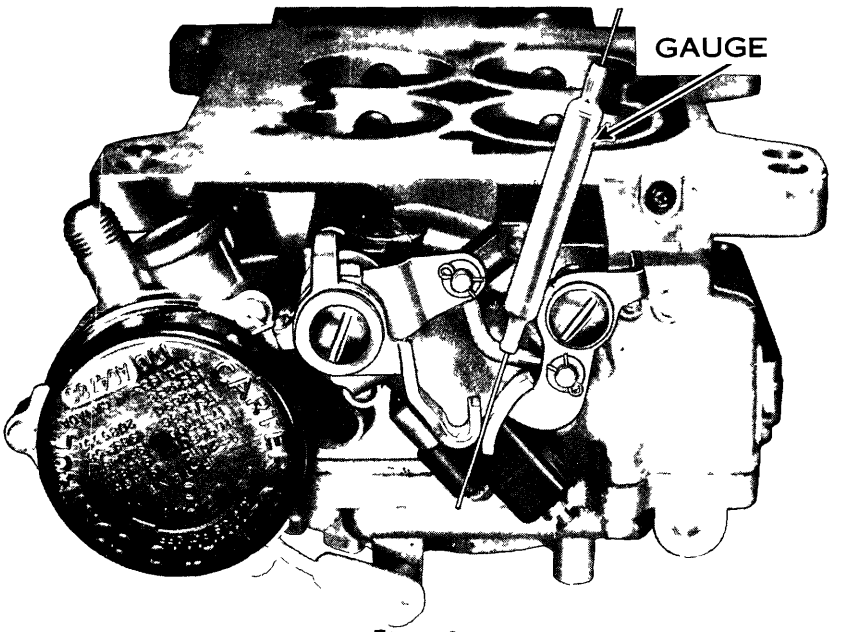

Figure 9

SECONDARY THROTTLE LEVER ADJUSTMENT (Fig. 9):

1. The stop lugs on both primary and secondary throttl lev rs should contact boss on flang at the same time. T adjust: b nd secondary throttl operating rod at angle (use bending to l T109-213). NOTE: Secondary thr ttl valv s will be a few degrees fr m v rticcl at wide open throttle
2. With primary and s condary throttle valves in tightly closed position, the clearance betw , n positive closing shoes on primary and secondary throttle levers should be as listed on carbureter specification page. To adjust, bend shoe on secondary lever.

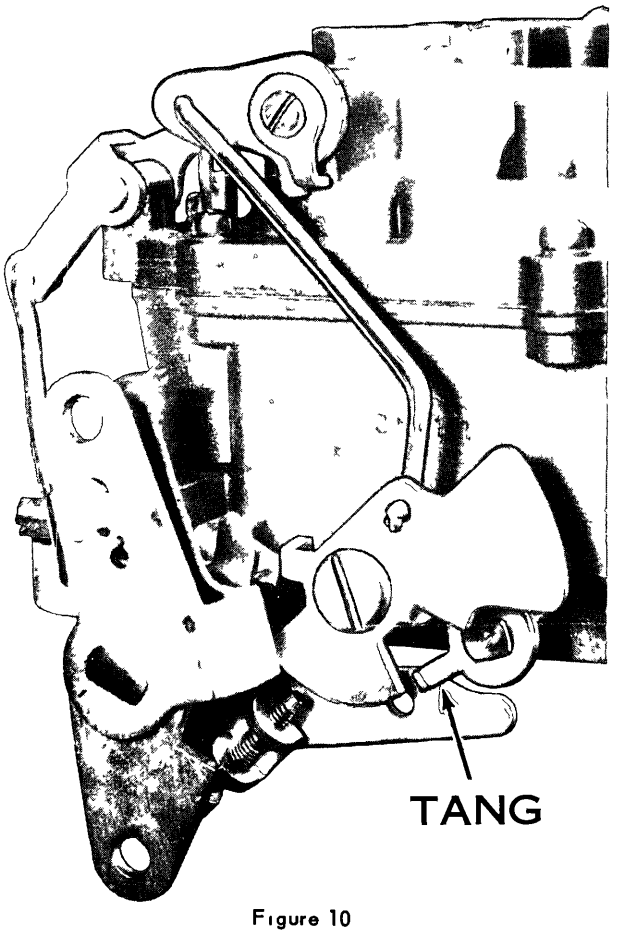

Figure 10

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 10):

Crack throttle valves and manually op n and clos the choke valve. Tang on secondary throttl lever should fr ly engage in notch of lock-out dog. If n cessary to adjust, bend tang on secondary throttle lever.

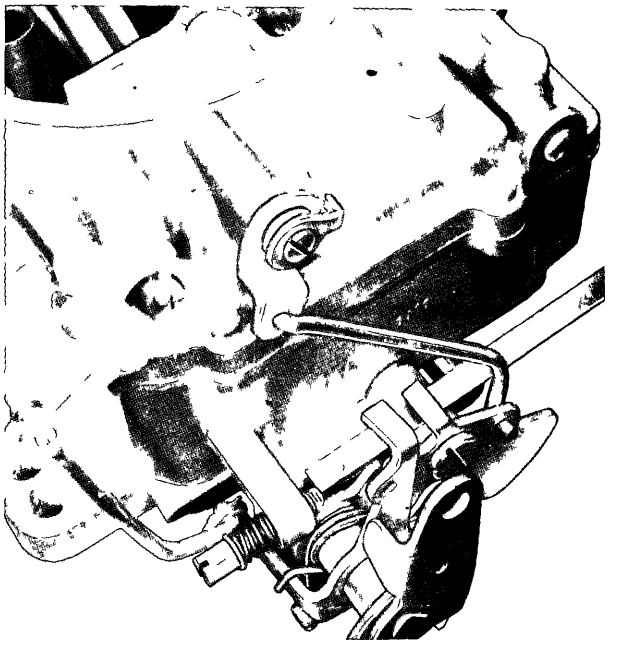

Figure 11

CAR STARTER SWITCH ADJUSTMENT (Fig 11):

1. Connect a test lamp across the start r switch t rminal.
2. Hold choke valve wide open and adjust idle sp d screw until it just contacts stop lug on throttl l v r when throttle is fully closed.
3. Holding a scale between center of idle sp d scr w and top edge of throttle lever stop lug; open throttl until test light indicates starter switch contact. Switch should make contact when th distance from top edge of stop lug and center of idl sp d scr w is b tw en 19/64" and 9/16". To adjust: if switch makes contact too arly decrease th numb r f shims in th switch guide block. If th switch makes contact too late incr as the number of shims in th switch guid block. Two sizes of shims ar availabl , Carter parts 153-11 (.018") and 153-12 (.006").

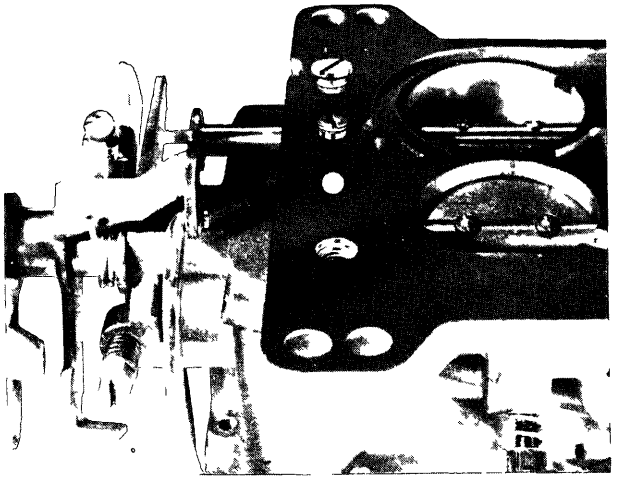

Figure 12

(Fig. 12):

Pump intake check ball, seat and screw plug are removed by inverting carbureter and removing from lower side of flange.

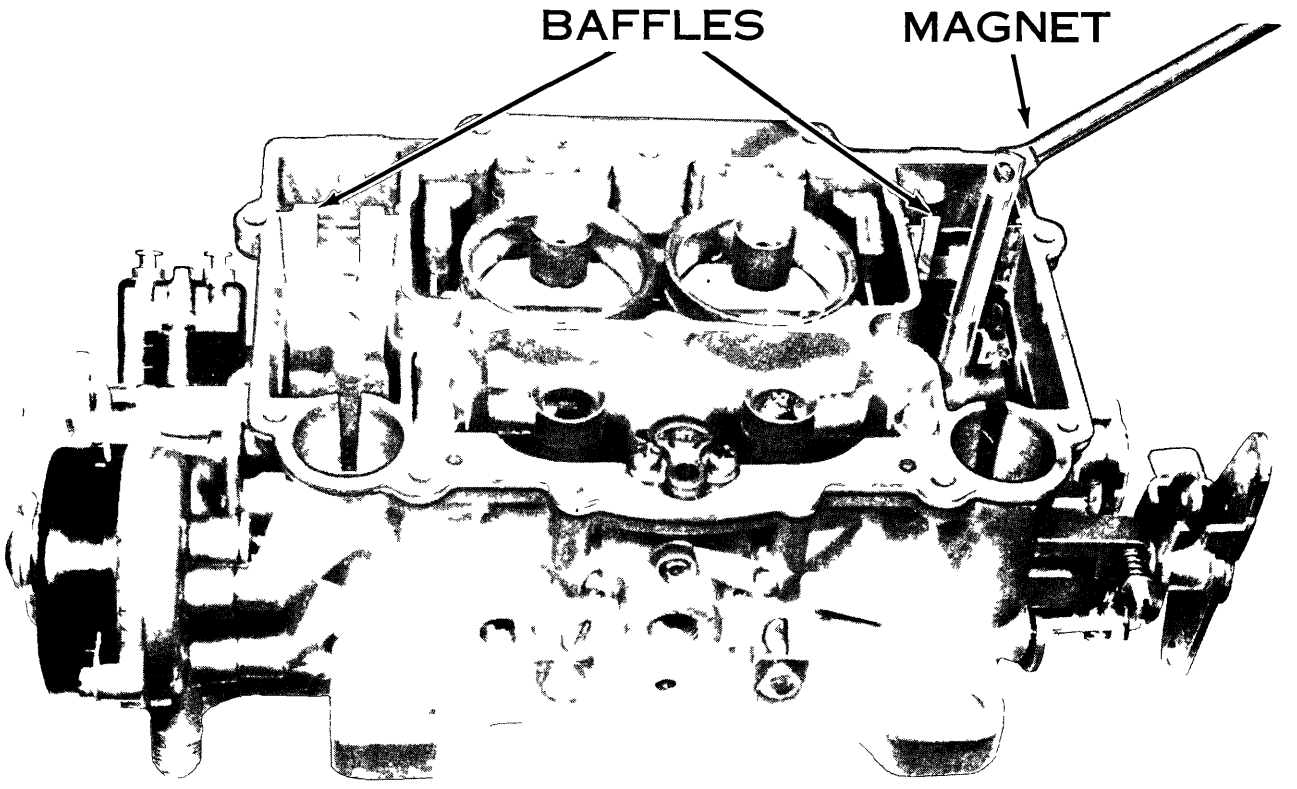

Figure 13

(Fig. 13):

Check to be sur that auxiliary throttle shaft weights move freely and are free from dirt and gum (Fig. 13).

Flooding, stumbl on acceleration and other performance complaints are, in many instances, caused by the presence of dirt, wat r or th r foreign matter in the carbureter. To aid in diagnosing the cause of the complaint, the carbureter should b car fully removed from the engine without draining the fuel from the bowl. The contents of the fuel bowl may th n be xamin d f r contamination as the carbureter is disassembled.

Ch ck th fu l in the bowl for contamination by dirt, water, gum or other foreign matter. A magnet moved through the fuel in th b wl will pick up and identify any iron oxide dust that may have caused intake needle and seat leakage.

Insp ct gask t d surfaces between body and air horn. Small nicks or burrs should be smoothed down to eliminate air or fu l l akag . B specially particular when inspecting the top surface of the inner wall of the bowl around the vacuum pist n passag . A poor seal at this location may contribute to a "cutting-out" on turns complaint.

Install fu l baffles as shown (Fig. 13) to prevent damage to floats.

Fill th carburet r bowl with clean fuel before installing on the manifold. This will help prevent dirt trapped in the fuel syst m from b ing dislodg d by th fr fl w f fu l as th carbur t r is primed. Th op rati n f th fl ats and intake n dl and s ats may be ch ck d und r pr ssur if a fuel pump is used at th b nch to fill th carbureter b wl. Op rat th throttl s v ral tim s and visually ch ck th discharg from th pump j ts.

Bef r installing th carbur t r, h ld chok valv p n and turn th idle spe d scr w until it just contacts th thr ttl lev r, th n 1/2 a turn m re t pen th throttl valv s n ugh to k ep th ngin running until th idl mixture and final R.P.M. adjustment can b mad .

(2529S) SYNCROMESH TRANSMISSION

(2536S) DYNAFLOW TRANSMISSION

WGD Dual Down-Draft Climatic® Control **Carbureters Nos. 2529S-2536S**

CARBURETER SPECIFICATIONS

For Buick 8 Cylinder Engine: 4.125 Inch Bore, 3.4 Inch Stroke

Dimensions: Flange size 1¼ inch dual, 4 bolt type
Primary venturi 11/32 inch I. D
Main venturi 1-3/16 inch I D

Vents: Outside, bowl cover—one, flange—two

Gasoline Intake: Size No 38 (1015 inch) drill in needle seat

Low Speed Jet Tube: Jet, size (2529S) 0292 inch, (2536S) 025 inch diameter By-pass in air horn, size 057 inch diameter Economizer in air horn, size 061 inch diameter Idle bleed in air horn size No 50 (070 inch) drill

Idle Port: Upper, slot type length 150 inch; width 030 inch.

Idle Port Opening: 087 to 093 inch above top edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size No 53 (0595 inch) drill

Main Nozzle: Nozzle is installed permanently DO NOT REMOVE Anti percolating well bleed, in plug size No 70 (028 inch) drill

Metering Rod (Vacumeter Type): See parts list for size

Metering Rod Jet. Size 090 inch diameter

Accelerating Pump. Discharge jet (twin) size (2529S) No 68 (031 inch) (2536S) No 69 (0292 inch) drill
Intake check seat size 115 to 120 inch diameter
Discharge (needle seat) size No 50 (070 inch) drill
Pump jet air bleed passage to outside ⅛ inch drill

Choke: Carter Climatic® Control—(2529S) set 1 point lean, (2536S) set on index Butterfly type offset valve Choke heat suction hole plug between air horn and piston housing size (2529S) No 42 (0935 inch) (2536S) No 48 (076 inch) drill

Vacuum Spark Port: Horizontal slot type 130 by 040 inch Bottom of port to be 010 to 016 inch above upper edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .030"-.035"	Breaker Point Setting .0125"-.0175"	Ignition Timing Breaker Points to Open 5° B. T. D. C. At Vibration Damper	Float Setting 17/64 Inch (Use Gauge T109-238)	Idle Adjustment Screw Setting 1/2 to 1½ Turns Open Idle Engine at 450 r.p.m.

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3643

Float Level: 17/64" (Gauge T109 238) between top of float (at center) and bowl cover
To adjust bend float lever

Float Alignment: Side of float parallel to edge of casting Minimum clearance between lever and air horn lugs without binding
To adjust bend float lever

Pump: With pump connector link in outer hole (long stroke) flat on pump arm should parallel straight edge on dust cover boss
To adjust bend throttle connector rod

Metering Rod: Metering rod should bottom with throttle valves seated

Choke Lever Clearance: With choke valve tightly closed there should be 020" (Gauge T109-29) between lug on outer choke shaft lever and stop on inner choke shaft lever Optional Adjustment (late prod) with slight clearance between tang on fast idle cam and stop on flange casting and inner choke shaft lever contacting lug on outer choke shaft lever align index mark on cam with adjusting screw To adjust bend lug on outer choke shaft lever

Fast Idle Throttle Valve Clearance: 026" (Gauge T109-189) between lower edge of valve and bore with adjusting screw on high step of cam

Unloader: (2529S) 9/64" (Gauge T109-34), (2536S) 11/64" (Gauge T109-166) between top edge of valve and inner wall of air horn
To adjust bend unloader arm on throttle lever

Car Starter Switch: Should contact between 31/64" and 11/16" travel of top edge of throttle lever stop lug and idle speed screw (Idle speed screw just touching stop lug with valve seating)
To adjust add or remove shims from switch

WCFB Four-Bore Down-Draft Climatic® Control Carbureter **No. 2347S**

CARBURETER SPECIFICATIONS

For Buick 8 Cylinder Engine: 4.00 Inch Bore, 3.20 Inch Stroke

Dimensions Flange size, 1 1/8 inch four bore 4 bolt type
Primary venturi size 11/32 inch I D
Main venturi size 1-3/16 inch I D

Vents In air horn (6) combination inside and outside
In dust cover (1) outside
In flange bore to atmosphere (4)

Gasoline Intake· Size No 34 (111 inch) drill in needle seat

Low Speed Jet Tube Jet size No 66 (033 inch) drill, by pass in body size 057 inch diameter Economizer, in body, size (0453 inch) drill Idle bleed in body size No 46 (081 inch) drill

Idle Port: Upper, slot type primary, length 140 inch width 030 inch Secondary length 103 inch, width 030 inch

Idle Port Opening Primary 092 to 098 inch, secondary 065 to 071 inch above top edge of valve with valve tightly closed

Lower Port. Primary (for idle adjustment screw), size No 55 (052 inch) drill

Secondary (no idle adjustment screw) size No 57 (.043 inch) drill

Set Idle Adjustment Screw 3/4 to 1 3/4 turns open For richer mixture turn screw out Do not idle engine below 450 r p m transmission in neutral

Main Nozzle: Installed permanently Do not remove Anti-percolating bleed (4) size No 70 (028 inch) drill

Metering Rod: Primary Economy step 0715 inch diameter Middl step tapers to 046 inch diameter Power step 046 inch diameter. Secondary None

Metering Rod Jet. Primary size 0995 inch diameter
Secondary size 086 inch diameter

Accelerating Pump: Discharge jet (twin) primary side only, siz No 70 (028 inch) drill Intake ball check seat size 115 to 120 inch diameter Discharge needle seat, size No 50 (070) inch) drill Relief passage (vent) to fuel chamber size No 42 (0935 inch) drill

Choke: Carter Climatic® Control, set one point lean Butterfly type offset choke valve, primary side only Choke heat suction hole, restriction in piston housing, size No 45 (082 inch) drill.

Vacuum Spark Port Horizontal slot (round end) 040 x 130 inch. Bottom of port 008 to 014 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .030"-.035"	Breaker Point Setting .015"	Ignition Timing Breaker Points to Open: 5° B.T.C. At Vibration Damper	Float Setting See Adjustments	Idle Adjustment Screw Setting 3/4 to 1 3/4 Turns Open Idle engine at 450 R.P.M. in neutral

NOTE· These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER
TRADE MARK REG U S PAT. OFF.
MARCA REGISTRADA

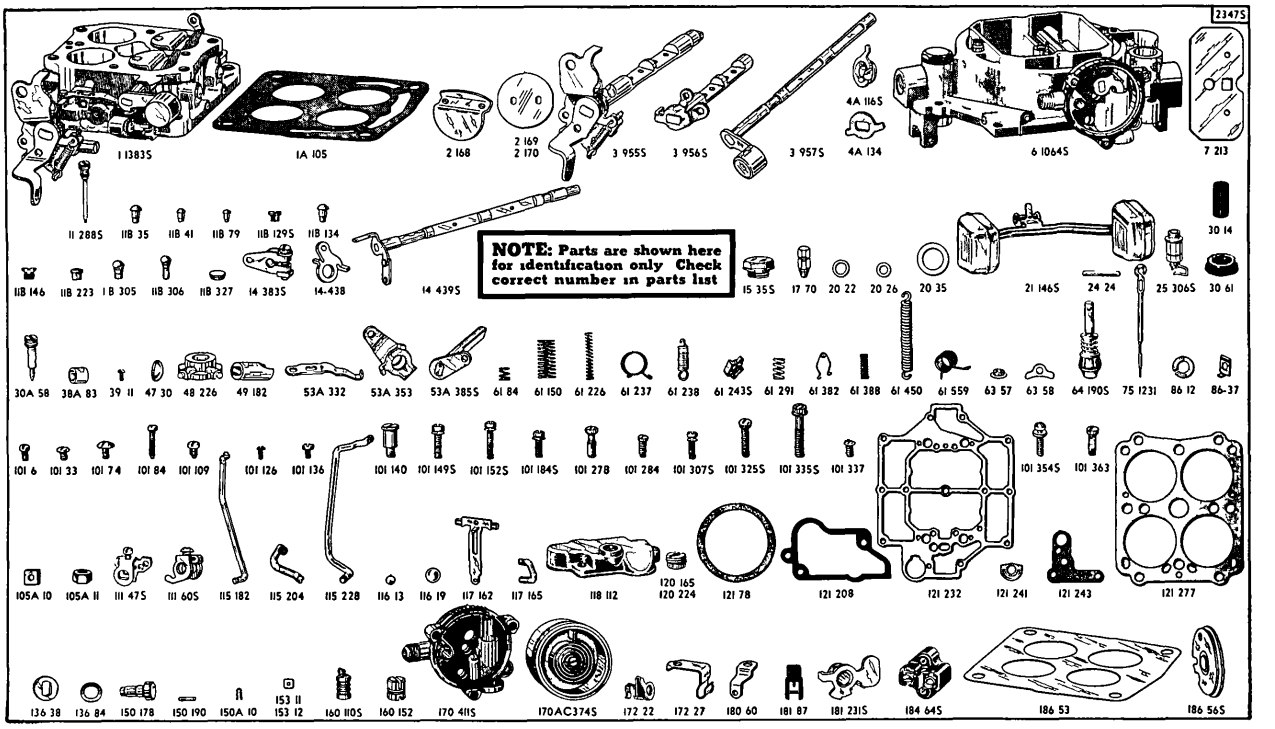
CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENTS: Two separate float adjustments must be made—lateral and vertical. LATERAL ADJUSTMENT: With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 3/16 inch (gauge T109-222) for both primary and secondary floats. Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of floats, the distance between top of floats and bowl cover should be 11/16 inch for both primary and secondary floats. Adjust by bending stop tabs on float bracket.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod (early) at upper angle, (late) at lower angle. (Use tool T109-213).

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.



FAST IDLE ADJUSTMENT: (A) Loosen choke lever clamp screw on choke shaft. Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing lever towards closed position—hold in place and tighten clamp screw. (B) With choke valve tightly closed, tighten fast idle adjusting screw until there is .020 inch (gauge T109-29) opening between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

UNLOADER ADJUSTMENT: With throttle wide open there should be 5/32 inch clearance (gauge T109-154) between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LEVER ADJUSTMENT: The stop lug on both primary and secondary throttle levers should contact boss on flange at the same time. To adjust bend secondary throttle operating rod at angle (use bending tool T109-213). NOTE: Secondary throttle valves will be a few degrees from wide open position.

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle adjustment. 1. With choke valve closed, edge of hook on lock-out arm should contact auxiliary throttle lever, making maximum contact of locking step on lever. 2. Open choke valve. Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position. Adjust by bending lock-out arm.

CHECKING AND ADJUSTING STARTER SWITCH: (CAUTION): If carbureter is installed on engine, make certain that the transmission is in neutral and parking brake is applied. 1. If carbureter is installed on Dynaflow car, make certain that throttle linkage and dash pot are correctly adjusted. If carbureter is removed from engine, connect a 6-volt battery and test lamp across switch terminal, so that lamp will light when switch makes contact. 2. Back off throttle stop screw, remove throttle connector rod and choke connector rod, rotate fast idle cam to slow idle position, and fully close the throttle valves. 3. While holding throttle valves fully closed, place a scale against choke unloader arm of throttle lever and make an index mark on carbureter body at the 1/2 inch division of scale. 4. With ignition switch turned on (or test lamp connected) hold end of scale against unloader arm and slowly open throttle until the drive pinion just engages flywheel ring gear (or test lamp lights). 5. If switch is correctly timed, the scale will then read between 1 1/4 inch and 1-9/16 inch at mark on carbureter body (3/4 inch to 1-1/16 inch travel of arm). 6. If necessary, make switch adjustment by reducing or increasing the total thickness of brass shims. If switch timing was found to be too early, reduce the total thickness of the shims. If timing was too late, increase total thickness of shims. Two sizes shims are available: 153-11, .018 inch; 153-12, .006 inch. After adjustment is completed, set engine idle at specified R.P.M.

Buick "V-8"—1956—Carbureter No. 2347S

WHEN SERVICING, USE GASKET ASSORTMENT No. 273A; REPAIR PACKAGE No 1822A

PART NAMES IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No.	PART NAME	
1-1383S	Body flange and switch assembly	
1A-105	FLANGE GASKET	
2-168	Auxiliary throttle valve	(2)
2-169	Secondary throttle valve	(2)
2-170	Primary throttle valve	(2)
3-955S	Primary throttle shaft and lever assembly	
3-956S	Secondary throttle shaft and lever assembly	
3-957S	Auxiliary throttle shaft lever and weight assembly	
4A-116S	Throttle shaft dog and collar assembly	
4A-134	Primary throttle shaft dog	
6-1064S	Air horn assembly (Identify by casting No 6 1062) (Sup by 6 1142S)	
6-1142S	Air horn assembly (Identify by casting No 6 1120)	
7-213	Choke valve	
11-288S	LOW SPEED JET ASSEMBLY	(4)
11B-35	Rivet plug	(6)
11B-41	Rivet plug (6 1064S (2), (6 1142S (1)	
11B-79	Rivet plug	(5)
11B-129S	Pump discharge passage plug assembly	
11B-134	Rivet plug	
11B-146	Level sight plug	(2)
11B-223	Nozzle passage and idle port rivet plug	(8)
11B-305	Rivet plug	(2)
11B-306	Rivet plug	
11B-327	Secondary throttle shaft rivet plug	

Part No.	PART NAME	
14-383S	Choke lever and screw assembly	
14-438	Cam trip lever	
14-439S	Choke piston lever link and shaft assembly	
15-35S	Strainer nut assembly	
17-70	PUMP CHECK NEEDLE

186-53	FLANGE BAFFLE PLATE	
186 56S	Choke baffle plate assembly	
192-21U	Carter starter switch unit	

NOTE Figures in parentheses indicate number of pieces used in one carbureter. Where no figure is shown, only one is used.

BUICK "V-8"

SPECIAL

(2378S) SYNCROMESH TRANSMISSION

MODEL 40

1956

(2400S) DYNAFLOW TRANSMISSION

WGD Dual Down-Draft Climatic® Control **Carbureters Nos. 2378S-2400S**

CARBURETER SPECIFICATIONS

For Buick 8 Cylinder Engine: 4.00 Inch Bore, 3.20 Inch Stroke

Dimensions: Flange size 1¼ inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D
Secondary venturi, 21/32 inch I. D
Main venturi, 1-3/16 inch I. D

Vents: Outside bowl cover—one, flange—two

Gasoline Intake: Size No 38 (1015 inch) drill in needle seat

Low Speed Jet Tube: Jet, size 028 inch diameter By-pass, in air horn, size No 55 (052 inch) drill Economizer, in air horn size 051 inch diameter Idle bleed in air horn, size No 50 (070 inch) drill.

Idle Port: Upper, slot type, length 130 inch, width 030 inch

Idle Port Opening: 077 to 083 inch above top edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size 0615 to 0655 inch diameter

Main Nozzle: Nozzle is installed permanently DO NOT REMOVE Anti percolating well bleed, in plug, size No 71 (026 inch) drill.

Metering Rod (Vacumeter Type): (2378S) 061 x 048 x 043. (2400S) 062 x 050 x .043.

Metering Rod Jet: Size 086 inch diameter

Accelerating Pump Discharge jet (twin) size No 70 (028 inch) drill Intake check seat size 115 to 120 inch diameter Discharge (needle seat) size No 50 (070 inch) drill Pump jet air bleed passage to outside ⅛ inch drill

Choke: Carter Climatic® Control—set on index Butterfly type, offset valve Choke heat suction hole in air horn, size (2378S) No 45 (082 inch) (2400S) No 48 (076 inch) drill

Vacuum Spark Port· Horizontal slot type 130 by 040 inch Bottom of port to be 010 to 016 inch above upper edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION· **Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.**

Spark Plug Gap .030"-.035"	Breaker Point Setting .015"	Ignition Timing Breaker Points to Open: 5° B. T. C. At Vibration Damper	Float Setting ¼ Inch (Use Gauge T109-31)	Idle Adjustment Screw Setting (2378S) ¼ to 1¼ (2400S) ½ to 1½ Turns Open Idle Engine at 450 r.p.m.

NOTE: **These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.**

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3643

Float Level: ¼" (Gauge T109-31) between top of float (at center) and bowl cover
To adjust bend float lever

Float Alignment. Side of float parallel to edge of casting Minimum clearance between lever and air horn lugs without binding
To adjust bend float lever

Pump: With pump connector link in outer hole (long stroke) flat on pump arm should parallel straight edge on dust cover boss
To adjust bend connector rod

Metering Rod: Metering rod should bottom with throttle valves seated

Choke Lever Clearance: 020" (Gauge T109-29) between lug on outer choke shaft lever and stop on inner choke shaft lever.
To adjust bend lug on outer choke shaft lever

Fast Idle Throttle Valve Clearance: 015" (Gauge T109-44) between lower edge of valve and bore with adjusting screw on high step of cam

Unloader: 5/32" (Gauge T109-154) between top edge of valve and inner wall of air horn.
To adjust bend unloader arm on throttle lever

Car Starter Switch· Should contact between 31/64" and 11/16" travel of top edge of throttle lever stop lug and idle speed screw (Idle speed screw just touching stop lug with valve seating)
To adjust add or remove shims from switch

BUICK "V-8" SPECIAL MODEL 40 1955

WGD DUAL DOWN-DRAFT CLIMATIC® CONTROL **CARBURETER No. 2292S**

CARBURETER SPECIFICATIONS

° **For Buick 8 Cylinder Engine: 3.625 Inch Bore, 3.20 Inch Stroke**

Dimensions: Flange size 1¼ inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 21/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Vents: Outside, bowl cover—one, flange—two.

Gasoline Intake: Size No. 38 (.1015 inch) drill in needle seat.

Low Speed Jet Tube: Jet, size .028 inch diameter. By-pass, in air horn, size No. 55 (.052 inch) drill. Economizer, in air horn, size .051 inch diameter. Idle Bleed, in air horn, size No. 50 (.070 inch) drill.

Idle Port: Upper, slot type, length .130 inch; width .030 inch.

Idle Port Opening: .077 to .083 inch above top edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size .0615 to .0655 inch diameter.

Main Nozzle: Nozzle is installed permanently. DO NOT REMOVE. Anti-percolating well jet, size No. 71 (.026 inch) drill.

Metering Rod (Vacumeter Type): Economy step .061 inch diameter. Middle step tapers to .048 inch diameter. Power step .043 inch diameter.

Metering Rod Jet: Size .086 inch diameter.

Accelerating Pump: Discharge jet (twin) size No. 72 (.025 inch) drill. Intake check seat size .115 to .120 inch diameter. Discharge (needle seat) size No. 50 (.070 inch) drill. Pump jet air bleed passage to outside ⅛ inch drill.

Choke: Carter Climatic® Control—set on index. Butterfly type, offset valve. Choke heat suction hole in piston housing, size No. 48 (.076 inch) drill.

Vacuum Spark Port: Horizontal slot type .130 by .040 inch. Bottom of port to be .010 to .016 inch above upper edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open:	Float Setting	Idle Adjustment Screw Setting
.030"-.035"	.0125"-.0175"	5° B. T. C. At Vibration Damper	¼ Inch (Use Gauge T109-31)	¼ to 1¼ Turns Open Idle Engine at 450 r.p.m.

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3643

Float Level: ¼" (Gauge T109-31) between top of float (at center) and bowl cover.
To adjust: bend float lever.

Float Alignment: Side of float parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding.
To adjust: bend float lever.

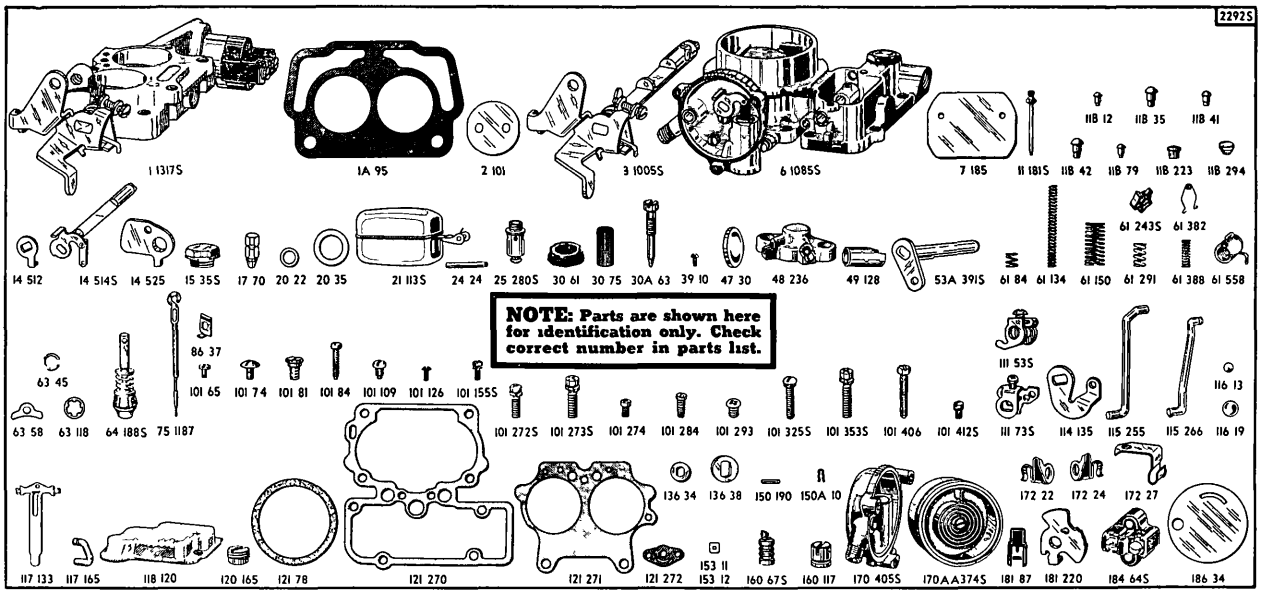
Pump: Flat on pump arm should parallel straight edge on dust cover boss.
To adjust: bend connector rod.

Metering Rod: Metering rod should bottom with throttle valves seated.

Choke Lever Clearance: .020" (Gauge T109-29) between lug on outer choke shaft lever and stop on inner choke shaft lever.
To adjust: bend lug on outer choke shaft lever.

Fast Idle Throttle Valve Clearance: .015" (Gauge T109-44) between lower edge of valve and bore with adjusting screw on high step of cam.

Fast Idle on Car: 1300 R.P.M. hot engine with speed screw on high step of cam.



Unloader: 3/16" (Gauge T109-28) between top edge of valve and inner wall of air horn.
To adjust: bend unloader arm on throttle lever.

Car Starter Switch: Should contact between 31/64" and 11/16" travel of top edge of throttle lever stop lug and idle speed screw. (Idle speed screw just touching stop lug with valve seating.)
To adjust: add or remove shims from switch.

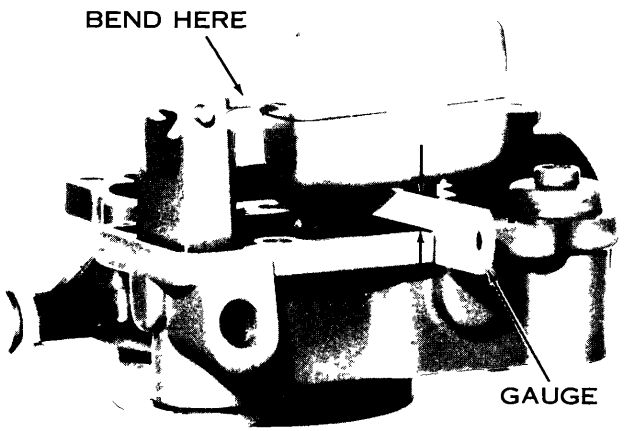
CARTER CARBURETOR
DIVISION OF acf INDUSTRIES INCORPORATED
ST. LOUIS, MO., U. S. A.

CARTER MODEL WGD CARBURETER FOR BUICK
(SERVICE ADJUSTMENT PROCEDURE)

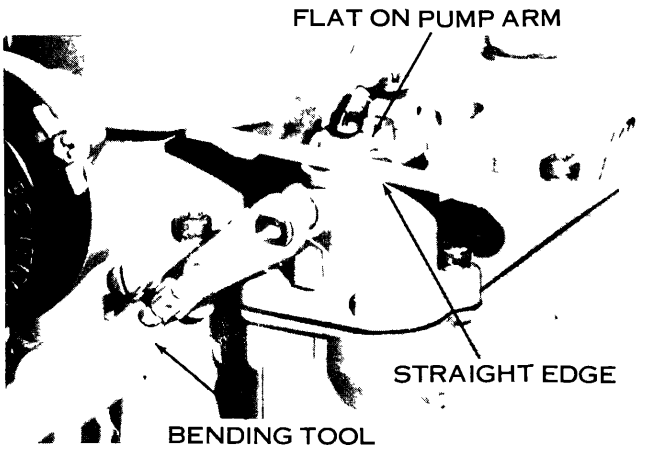
NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the brass identification tag, when requesting specification pages.



FLOAT ALIGNMENT ADJUSTMENT (Fig. 1)

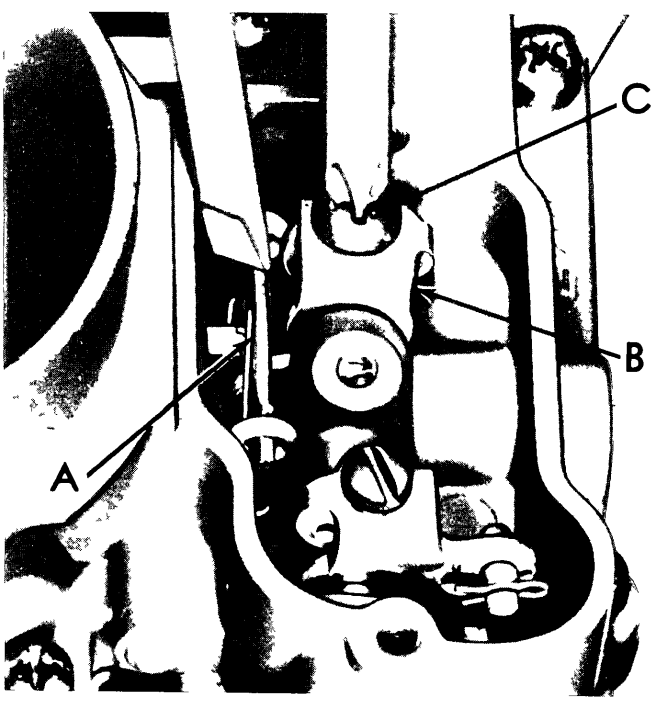
1. Sight down the side of the float shell to determine if the side of the float is parallel to the outer edge of the air h rn casting. TO ADJUST: Bend float lever by applying pressure to the end of the float shell with the fingers while supporting the float lever with the thumb.

   CAUTION: To avoid damaging the float, apply only enough pressure to bend float lever.



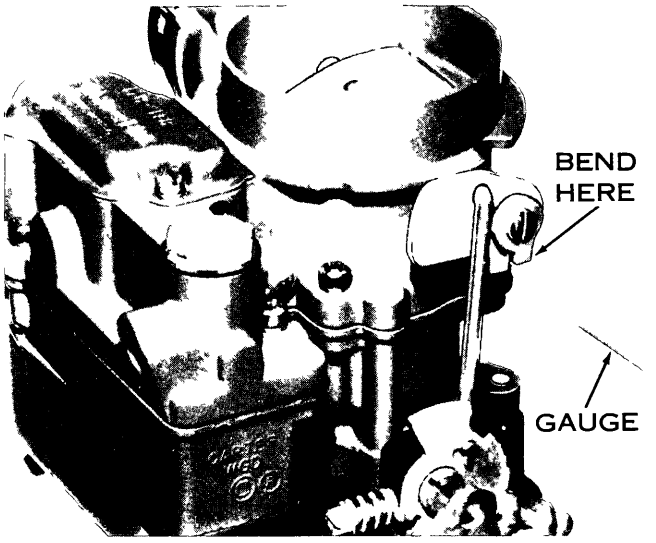
2. After aligning float, remove as much clearance as possibl between arms of float lever and lugs on air horn by bending the float lever. Arms of float lever should be as parallel to the inner surfaces of lugs on air horn as possible.

   Float must operate freely without excess clearance on its hinge pin.



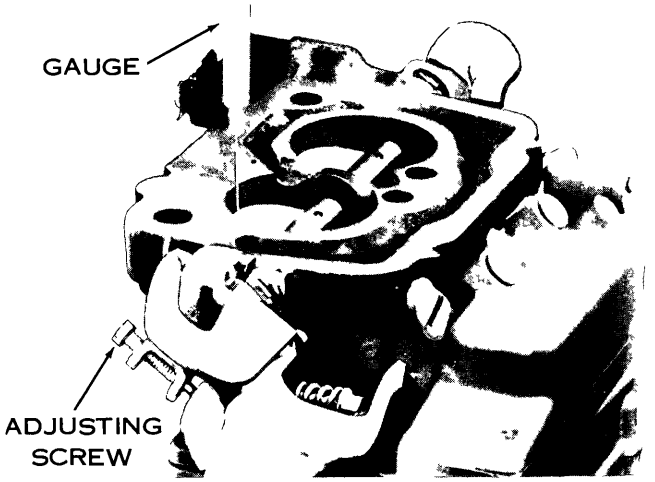
FLOAT LEVEL ADJUSTMENT (Fig. 2)

With air horn inv rt d and n dle s at d, adjust float arm to cl aranc b tw n top c nt r of float and air horn is as sted on carbur t r sp cification page. R ch ck float gnm nt.



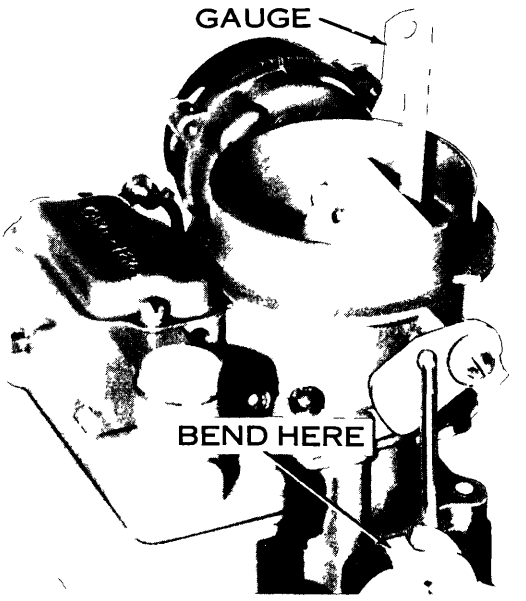
PUMP ADJUSTMENT (Fig. 3)

1. Back out idle speed screw until throttl valv s s at in bores of carburetor. NOTE: Be sure ch k is wide open so fast idle cam does not hold valv open.
2. Hold straight edge across top of dust cov r boss at pump arm. Bend rod at upper angle until flat of pump arm is parallel with straight edge while throttl valv s ar seated. (Use bending tool T109-213).



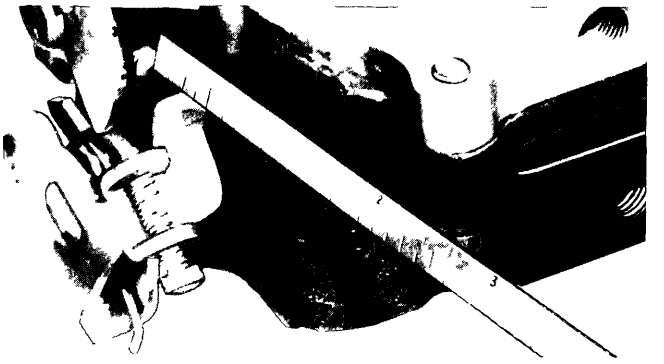
METERING ROD ADJUSTMENT (Fig. 4)

1. Back out idle sp d scr w until throttl valv s s at. NOTE: Be sur chok is wide op n so fast idle cam does not hold valv op n.
2. Pr ss down on vacumeter piston link (A) until m t ring rods bottom in carbur t r body.
3. Holding rods in this downward position and with throttle valves seated, r volv met ring rod arm (B) until finger on arm c ntacts lip of vacumeter link. Hold in plac and carefully tight n clamp scr w (C).



CHOKE SHAFT LEVER CLEARANCE ADJUSTMENT (Fig. 5)

1. Hold choke valve tightly closed.
2. H ld fast idl cam against stop on casting.
3. Th cl aranc between lug on outer choke shaft lever and stop n inner choke shaft lever should be as listed n carbur ter specification page. TO ADJUST: Bend lug n ut r choke shaft lever. (Use bending tool T109-214).



FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 6)

1. Be sur ch k valve is closed.
2. Adjust fast idle adjusting screw against high st p of cam until th clearance b twe n thr ttle valv (sid opp site port) and b re is as list d n carbur ter specificati n pag .

UNLOADER ADJUSTMENT (Fig. 7)

1. Hold throttle valves wide open.
2. Close choke valve as far as possible without forcing.
3. Clearance between top edge of choke valve and inn r wall of air horn should be as listed on carbureter sp cification page.
4. Adjust by bending choke unloader arm on throttle l v r. (Use bending tool T109-41).

CAR STARTER SWITCH ADJUSTMENT (Fig. 8)

1. Connect a test lamp across the starter switch terminal.
2. Hold choke valve wide open and adjust idle speed scr w until it just contacts stop lug on throttle lever wh n throttle is fully closed.
3. Holding a scale between center of idle speed screw and top edge of throttle lever stop lug; open throttle until test light indicates starter switch contact. Switch sh uld make contact when the distance from top edge of st p lug and center of idle speed screw is between 31/64" and 11/16". TO ADJUST: If switch makes contact t early, d cr as th number of shims in th switch guid block. If th switch mak s contact t late, increase th numb r of shims in the switch guid bl ck. Tw siz s of shims ar availabl , Cart r parts 153-11(.018") and 153-12 (.006").

WCFB Four-Bore Down-Draft Climatic® Control Carbureter **No. 2358S**

CARBURETER SPECIFICATIONS

For Buick 8 Cylinder Engine: 4.00 Inch Bore, 3.20 Inch Stroke

Dimensions: Flange size, 1 1/8 inch Four bore, 4 bolt type
Primary venturi size, 11/32 inch I D
Main Venturi size, 1-3/16 inch I D

Vents: Combination inside and outside (6)
In flange, bore to atmosphere (4)

Gasoline Intake: Primary, size No 38 (1015 inch) drill, secondary, size No 42 (0935 inch) drill in needle seat

Low Speed Jet Tube: Jet, size 031 inch diameter By pass in body size 057 inch diameter Economizer in body size 0453 inch diameter Idle bleed in body size No 44 (086 inch) drill

Idle Port: Upper, slot type, primary length 125 inch width 030 inch Secondary, length 103 inch, width 030 inch

Idle Port Opening: Primary 074 to 080 inch secondary 065 to 071 inch above top edge of valve with valve tightly closed.

Lower Port: Primary (for idle adjustment screw) size No 55 (052 inch) drill
Secondary (no idle adjustment screw) size No 57 (043 inch) drill

Set Idle Adjustment Screw: 3/4 to 1 3/4 turns open For richer mixture turn screw out. Do not idle engine below 450 R P M

Main Nozzle: Installed permanently Do not remove Anti percolating jet (4) size No 70 (028 inch) drill

Metering Rod: Primary Economy step 067 inch diameter Middle step tapers to 043 inch diameter Power step 043 inch diameter
Secondary None

Metering Rod Jet: Primary size 096 inch diameter
Secondary size 082 inch diameter

Metering Rod Setting. See adjustments

Accelerating Pump Discharge jet (twin) primary side only size No 70 (028 inch) drill Intake ball check seat size 115 to 120 inch Discharge needle seat, size No 50 (070 inch) drill Relief passage (vent) to fuel chamber size No 42 (0935 inch) drill

Pump Adjustment: See adjustments

Choke: Carter Climatic® Control, set on index Butterfly type offset choke valve, primary side only Choke heat suction hole restriction in piston housing size No 48 (076 inch) drill

Vacuum Spark Port Horizontal slot (round end) 040 x 130 inch Bottom of port 008 to 014 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION. Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open 5° B. T. D C. At Vibration Damper	Float Setting (See Adjustments)	Idle Adjustment Screw Setting 3/4 to 1 3/4 Turns Open Idle Engine at 450 R.P.M
.025"-.031"	.0125"-.0175"			

NOTE: These cars equipped with Hydraulic Valve Lifters—NO ADJUSTMENT

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge Adjustment should be made by bending arms of floats
VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge Vertical distance between top of float and machined surface of casting must be 3/32 inch (gauge T109-233) for primary floats, and 3/16 inch (gauge T109-222) for secondary floats Adjust by bending float arms
FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of floats, the distance between top of floats and bowl cover should be 19/32 inch for primary floats and 11/16 inch for secondary floats Adjust by bending stop tabs on float bracket
PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod (early) at upper angle (late) at lower angle (Use tool T109-213)
METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and

PRINTED IN U.S.A.

loosen metering rod arm clamp screw 2 With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw

FAST IDLE ADJUSTMENT. (a) Loosen choke lever clamp screw on choke shaft Insert 025 inch wire gauge (T109-189 may be used) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing lever towards closed position—hold in place and tighten clamp screw (b) With choke valve tightly closed tighten fast idle adjusting screw until there is 016 inch (gauge T109-44) opening between throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjusting screw is on high step of cam while making this adjustment

UNLOADER ADJUSTMENT With throttle wide open there should be 3/16 inch clearance (gauge T109-28) between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41)

SECONDARY THROTTLE LEVER ADJUSTMENT The stop lug on both primary and secondary levers should contact boss on flange at the same time To adjust bend secondary throttle operating rod at angle (use bending tool T109-213) NOTE Secondary throttle valves will be a few degrees from wide open position

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT· This adjustment should be made after completing fast idle adjustment 1 With choke valve closed, edge of hook on lockout arm should contact auxiliary throttle lever, making maximum contact of locking step on lever 2 Open choke valve Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position Adjust by bending lock-out arm

CHECKING AND ADJUSTING STARTER SWITCH

(CAUTION): If carbureter is installed on engine, make certain that the transmission is in neutral and parking brake is applied 1 If carbureter is installed on Dynaflow car, make certain that throttle linkage and dash pot are correctly adjusted If carbureter is removed from engine, connect a 6-volt battery and test lamp across switch terminal, so that lamp will light when switch makes contact 2 Back off throttle stop screw, remove throttle connector rod and choke connector rod, rotate fast idle cam to slow idle position, and fully close the throttle valves 3 While holding throttle valves fully closed, place a scale against choke unloader arm of throttle lever and make an index mark on carbureter body at the ½ inch division of scale 4 With ignition switch turned on (or test lamp connected) hold end of scale against unloader arm and slowly open throttle until the drive pinion just engages flywheel ring gear (or test lamp lights) 5 If switch is correctly timed the scale will then read between 1¼ inch and 1-9/16 inch at mark on carbureter body (¾ inch to 1-1/16 inch travel of arm) 6 If necessary, make switch adjustment by reducing or increasing the total thickness of brass shims If switch timing was found to be too early reduce the total thickness of the shims If timing was too late, increase total thickness of shims Two sizes shims are available 153-11, 018 inch 153-12, 006 inch After adjustment is completed, set engine idle at specified R P M

loosen metering rod arm clamp screw 2 With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

FAST IDLE ADJUSTMENT (a) Loosen choke lever clamp screw on choke shaft Insert 021 inch feeler gauge (T109-29 may be used) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing lever towards closed position—hold in place and tighten clamp screw (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is .018 inch (gauge T109-44) opening between throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjusting screw is on high step of cam while making this adjustment

UNLOADER ADJUSTMENT. With throttle wide open there should be 11/64 inch clearance (gauge T109-166) between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41)

SECONDARY THROTTLE LEVER ADJUSTMENT· The stop lug on both primary and secondary throttle levers should contact boss on flange at the same time To adjust bend secondary throttle operating rod at angle (use bending tool T109-213) NOTE Secondary throttle valves will be a few degrees from wide open position

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle adjustment 1 With choke valve closed, edge of hook on lock-out arm should contact auxiliary throttle lever, making maximum contact of locking step on lever 2 Open choke valve Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position Adjust by bending lock-out arm

CHECKING AND ADJUSTING STARTER SWITCH: **(CAUTION)** If carbureter is installed on engine, make certain that the transmission is in neutral and parking brake is applied 1 If carbureter is installed on Dynaflow car, make certain that throttle linkage and dash pot are correctly adjusted If carbureter is removed from engine, connect a 6-volt battery and test lamp across switch terminal, so that lamp will light when switch makes contact 2 Back off throttle stop screw, remove throttle connector rod and choke connector rod, rotate fast idle cam to slow idle position, and fully close the throttle valves 3 While holding throttle valves fully closed, place a scale against choke unloader arm of throttle lever and make an index mark on carbureter body at the ½ inch division of scale 4 With ignition switch turned on (or test lamp connected) hold end of scale against unloader arm and slowly open throttle until the drive pinion just engages flywheel ring gear (or test lamp lights) 5 If switch is correctly timed, the scale will then read between 1¼ inch and 1-9/16 inch at mark on carbureter body (¾ inch to 1-1/16 inch travel of arm) 6 If necessary, make switch adjustment by reducing or increasing the total thickness of brass shims If switch timing was found to be too early reduce the total thickness of the shims If timing was too late increase total thickness of shims Two sizes shims are available 153-11 018 inch 153-12, 006 inch After adjustment is completed, set engine idle at specified R P M

Buick "V-8"—1955—Carbureter No. 2197S

NOTE· Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown, only one is used.

Casting No. 1165 on Face of Flange

BUICK "V8" SPECIAL MODEL 40 1955

WCD Dual Down-Draft Climatic® Control **Carbureter No. 2179S**

CARBURETER SPECIFICATIONS

For Buick 8 Cylinder Engine: 3.625 Inch Bore, 3.20 Inch Stroke

Dimensions: Flange size, 1¼ inch dual 4 bolt type.
Primary venturi, size 11/32 inch I. D.
Secondary venturi, size 21/32 inch I. D.
Main venturi, size 1-3/16 inch I. D.

Float Level: See adjustments.

Vents: Inside none. Outside, in air horn 2—size No. 12 (.189 inch) drill. Outside, in body flange to bore, 2—size .065 inch diameter.

Gasoline Intake: Size No 38 (.1015 inch) drill in needle seat.

Low Speed Jet Tube: Jet, size No. 66 (.033 inch) drill. By-pass, in bowl cover, size .059 inch diameter.
Economizer, in bowl cover, size .057 inch diameter.
Idle bleed, in bowl cover, No. 47 (.0785 inch) drill.

Idle Port: Upper port, slot type, length .115 inch; width .030 inch.

Idle Port Opening: Top of port to be .057 to .063 inch above top edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Do not idle engine below 450 r.p.m. (trans. in neutral).

Main Nozzle: Nozzle is installed permanently. DO NOT REMOVE. Upper bleed hole in nozzle, size No. 70 (.028 inch) drill.

Metering Rod (Vacumeter Type): Economy step .0695 inch diameter. Middle step tapers to .062 inch diameter. Power step .054 inch diameter.

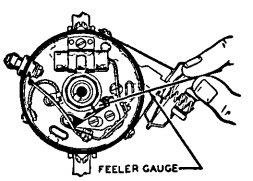
Metering Rod Jet: Size No. 43 (.089 inch) drill.

Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) size No. 70 (.028 inch) drill. Intake ball check seat, size No. 32 (.113 inch) drill. Discharge needle seat, size No. 50 (.070 inch) drill.

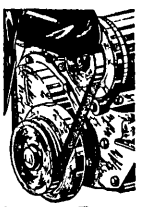
Pump Adjustment: See adjustments.

Choke: Carter Climatic® control, set on index. Butterfly type, offset valve. Choke heat suction hole, in bowl cover, size No. 42 (.0935 inch) drill.

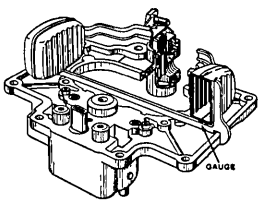


Vacuum Spark Port: Horizontal slot type .040 by .130 inch. Bottom of port to be .010 to .014 inch above top edge of valve with valve tightly closed.

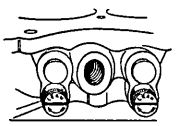
Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .030"-.035"



Breaker Point Setting .015"

Ignition Timing Breaker Points to Open: 5° B. T. C.

Float Setting See Adjustments

Idle Adjustment Screw Setting ½ to 1½ Turns Open

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and **float lip resting on seated needle, place float gauge T109-162** directly under float with notched portions of gauge fitted over edges of casting. Sides of floats should barely touch the vertical uprights of float gauge. Adjustment should be made by bending arms of floats.

VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 3/16 inch. Adjust by bending float arms. Remove float, install bowl cover gasket and then reinstall float.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm with ends extending away from countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbuerter. Be sure fast idle adjusting screw does not hold throttle open. Place universal pump travel gauge T109-117S, inverted on edge of dust cover boss of bowl cover. Turn knurled nut of gauge until finger just touches upper nd of plunger shaft. Number indicated on gauge should be "29". Hold the gauge vertical to insure correct reading. Adjust by bending the throttle connector rod at upper angle, use tool T109-213. Optional Adjustment: With throttle valves seated in bores of carbureter, the distance from the top of the plunger shaft to the top of the dust cover boss should be 17/64 inch. Adjust as mentioned above.

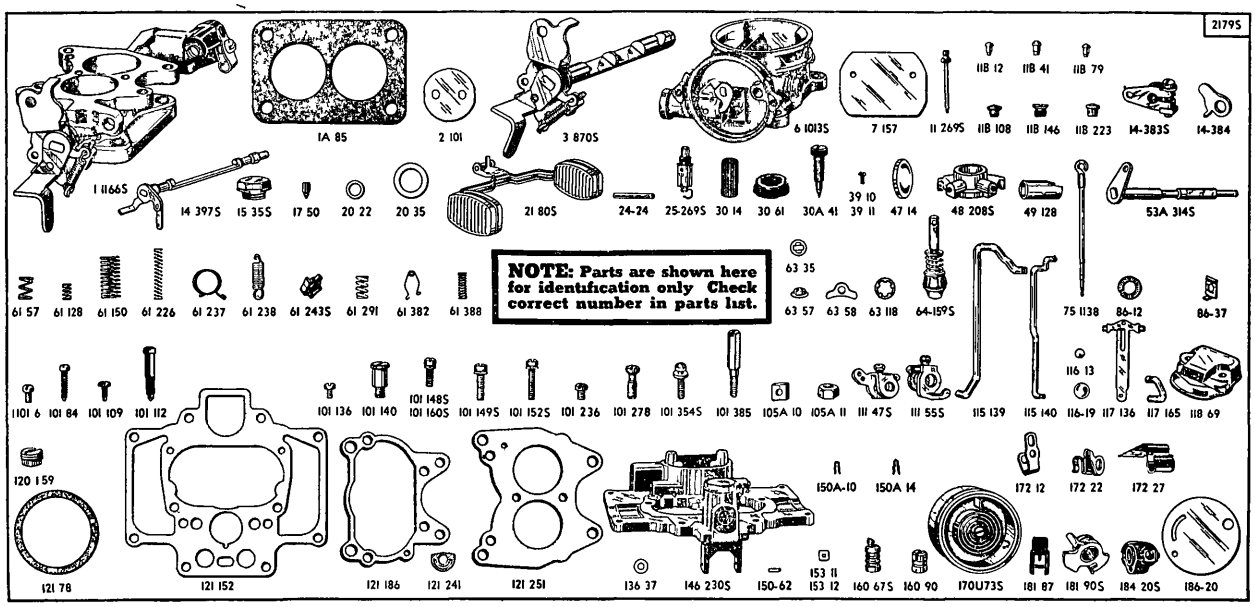
METERING ROD ADJUSTMENT: The metering rods must be adjusted after the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: With the throttle lever set screw backed out and throttle valves seated in bores of carbureter, press down on vacumeter link until metering rods bottom. With rods held in this position, revolve metering rod arm until lip contacts vacumeter link. Hold in place and carefully tighten metering rod arm set screw.

FAST IDLE ADJUSTMENT: A. Loosen choke lever clamp screw on choke shaft. Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position. Hold in place and tighten clamp screw. B. With choke valve tightly closed, tighten fast idle adjusting screw until there is .025 inch opening (gauge T109-189 may be used) between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

UNLOADER ADJUSTMENT: With throttle wide open there **should be 1/4 inch (gauge T109-31) clearance between upper** edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

CHECKING AND ADJUSTING STARTER SWITCH: CAUTION: If carbureter is installed on engine, make certain that transmission is in neutral and parking brake is applied.

1. If carbureter is installed on Dynaflow car, make certain that throttle linkage and dash pot are correctly adjusted. If carbureter is removed from engine, connect a 6-volt battery and test lamp across switch terminal, so that lamp will light when switch makes contact.



2. Back off throttle stop screw, remove throttle connector rod, rotate fast idle cam to slow idle position, and fully close the throttle valves.

3. While holding throttle valves fully closed, place a scale against choke unloader arm of throttle lever and make an index mark on carbureter body at the one inch division on scale.

4. With ignition switch turned on (or test lamp connected) hold end of scale against unloader arm and slowly open throttle until the drive pinion just engages flywheel ring gear (or test lamp lights).

5. If switch is correctly timed, the scale will then read between 1-15/16 inch and 2-5/16 inch at mark on carbureter body (15/16 inch to 1-5/16 inch travel of arm).

6. If necessary, make switch adjustment by reducing or increasing the total thickness of the brass shims. If switch timing was found to be too early, reduce the total thickness of the shims. If timing was too late, increase total thickness of shims. Two sizes of shims are available: 153-11 .018 inch — 153-12 .006 inch. After adjustment is completed, set engine idle at specified r.p.m.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vertical **LATERAL ADJUSTMENT** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge Adjustment should be made by bending arms of floats
VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge Vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109-232) for primary floats, and 3/16 inch (gauge T109-222) for secondary floats Adjust by bending float arms
FLOAT DROP ADJUSTMENT With bowl cover held in upright position and measuring from center of floats the distance between top of floats and bowl cover should be 5/8 inch for primary floats and 11/16 inch for secondary floats Adjust by bending stop tabs on float bracket
PUMP ADJUSTMENT Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod (early) at upper angle (late) at lower angle (Use tool T109-213)
METERING ROD ADJUSTMENT Metering rod adjustment is important and must be made after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacuumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacuumeter link Hold in place and carefully tighten clamp screw
FAST IDLE ADJUSTMENT (a) Loosen choke lever clamp screw on choke shaft Insert 021 inch feeler gauge (T109-29 may be used) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out

of linkage by pressing lever towards closed position—hold in place and tighten clamp screw (b) With choke valve tightly closed tighten fast idle adjusting screw until there is 018 inch (gauge T109-44) opening between throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjusting screw is on high step of cam while making this adjustment

UNLOADER ADJUSTMENT With throttle wide open there should be 11/64 inch clearance (gauge T109-166) between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41)

AUXILIARY THROTTLE VALVE ADJUSTMENT (a) Disconnect secondary throttle operating rod (b) Adjust stop lug on secondary throttle lever (use bending tool T109-214) until there is 27/64 inch clearance (gauge T109-242) between lower edge of auxiliary throttle valve and bore, when lug is against stop on flange

SECONDARY THROTTLE LEVER ADJUSTMENT The stop lug on both primary and secondary throttle levers should contact boss on flange at the same time To adjust bend secondary throttle operating rod at angle (use bending tool T109 213) NOTE Secondary throttle valves will be a few degrees from wide open position

AUXILIARY THROTTLE LOCK OUT ADJUSTMENT This adjustment should be made after completing fast idle adjustment 1 With choke valve closed edge of hook on lock out arm should contact auxiliary throttle lever making maximum contact of locking step on lever 2 Open choke valve Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position Adjust by bending lock out arm

CHECKING AND ADJUSTING STARTER SWITCH

(CAUTION) If carbureter is installed on engine make certain that the transmission is in neutral and parking brake is applied 1 If carbureter is installed on Dynaflow car make certain that throttle linkage and dash pot are correctly adjusted If carbureter is removed from engine, connect a 6 volt battery and test lamp across switch terminal, so that lamp will light when switch makes contact 2 Back off throttle stop screw remove throttle connector rod and choke connector rod rotate fast idle cam to slow idle position, and fully close the throttle valves 3 While holding throttle valves fully closed, place a scale against choke unloader arm of throttle lever and make an index mark on carbureter body at the ½ inch division of scale 4 With ignition switch turned on (or test lamp connected) hold end of scale against unloader arm and slowly open throttle until the drive pinion just engages flywheel ring gear (or test lamp lights) 5 If switch is correctly timed the scale will then read between 1¼ inch and 1 9/16 inch at mark on carbureter body (¾ inch to 1 1/16 inch travel of arm) 6 If necessary make switch adjustment by reducing or increasing the total thickness of the brass shims If switch timing was found to be too early, reduce the total thickness of the shims If timing was too late increase total thickness of shims Two sizes shims are available 153 11 018 inch 153 12 006 inch After adjustment is completed set engine idle at specified R P M

CARBURETER SPECIFICATIONS

For Buick 8 Cylinder Engine 3 625 Inch Bore 3 20 Inch Stroke (Series 40), 4 00 Inch Bore 3 20 Inch Stroke (Series 50)

Dimensions Flange size 1¼ inch dual 4 bolt type
Primary venturi size 11/32 inch I D
Secondary venturi size 21/32 inch I D
Main venturi size 1 3/16 inch I D

Float Level See adjustments

Vents Inside none Outside in air horn 2—size No 12 (189 inch) drill Outside in body flange to bore 2—size 065 inch diameter

Gasoline Intake Size No 38 (1015 inch) drill in needle seat

Low Speed Jet Tube Jet size No 69 (0292 inch) drill By pass bowl cover size 059 inch diameter
Economizer bowl cover size (2017S) 0492 inch diameter (2081S early prod) No 55 (052 inch) drill (2081S late prod —2081SA) 057 inch diameter
Idle bleed bowl cover No 47 (0785 inch) drill

Idle Port Upper port slot type length 115 inch width 030 inch

Idle Port Opening Top of port to be (2017S) 047 to 053 inch (2081S SA) 057 to 063 inch above top edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw) Size 0615 to 0655 inch diameter

Set Idle Adjustment Screw (2017S) ½ to 1½ (2081S SA) ¾ to 1¾ turns open For richer mixture turn screw out Do not idle engine below 450 r p m (trans in neutral)

Main Nozzle Nozzle is installed permanently **Do not remove**

Metering Rod (Vacumeter Type) Economy step (2017S) 0645 inch (2081S SA) 0665 inch diameter Middle step tapers to (2017S) 050 inch (2081S SA) 0565 inch diameter Power step (2017S) 048 inch (2081S SA) 045 inch diameter

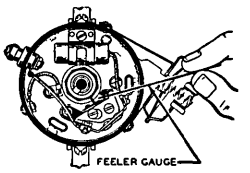
Metering Rod Jet Size (2017S) No 44 (086 inch) (2081S SA) No 43 (089 inch) drill

Metering Rod Setting See adjustments

Accelerating Pump Discharge jet (twin) size No 70 (028 inch) drill Intake ball check seat size No 32 (113 inch) drill Discharge needle seat size No 50 (070 inch) drill

Pump Adjustment See adjustments

Choke Carter Climatic® control set on index Butterfly type offset valve Choke heat suction hole in bowl cover size (2017S 2081SA) No 42 (0935 inch) (2081S) No 38 (1015 inch) drill



Vacuum Spark Port (2017S early prod) round type 040 inch diameter (2017S late prod) round type 081 inch diameter (2081S SA) horizontal slot type 040 by 130 inch Bottom of port to be (2017S early prod) 033 to 037 inch (2017S late prod) 013 to 017 inch (2081S SA) 010 to 014 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical **LATERAL ADJUSTMENT:** With bowl cover assembly inverted bowl cover gasket removed and float lip resting on seated needle place float gauge T109 240 directly under float with notched portions of gauge fitted over edges of casting Sides of floats should barely touch the verti cal uprights of float gauge Adjustment should be made by bending arms of floats

VERTICAL ADJUSTMENT: With float gauge in same position floats should just clear the horizontal portion of gauge (Verti cal distance between top of float and machined surface of casting must be 15/64 inch) Adjust by bending float arms Remove float install bowl cover gasket and then reinstall float

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm with ends extending away from countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Be sure fast idle adjusting screw does not hold throttle open Place universal pump travol gauge T109-117S inverted on edge of dust cover boss of bowl cover Turn knurled nut of gauge until finger just touches upper end of plunger shaft Number indicated on gauge should be '29" Hold the gauge vertical to insure correct reading Ad just by bending the throttle connector rod at upper angle use tool T109 213 Optional Adjustment With throttle valves seated in bores of carbureter the distance from the top of the plunger shaft to the top of the dust cover boss should be 17/64 inch Adjust as mentioned above

METERING ROD ADJUSTMENT: The metering rods must be adjusted after the pump adjustment No metering rod gauges are necessary Procedure is as follows With the throttle lever set screw backed out and throttle valves seated in bores of carbureter press down on vacumeter link until metering rods bottom With rods held in this position revolve metering rod arm until lip contacts vacumeter link Hold in place and care fully tighten metering rod arm set screw

FAST IDLE ADJUSTMENT: A Loosen choke lever clamp screw on choke shaft Insert 020 inch feeler gauge (T109-29) be tween lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position Hold in place and tighten clamp screw B With choke valve tightly closed tighten fast idle adjusting screw until there is (2017S) 015 inch opening (gauge T109 44) (2081S SA) 028 inch opening (gauge T109 189 may be used) between throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjust ing screw is on high step of cam while making this adjustment

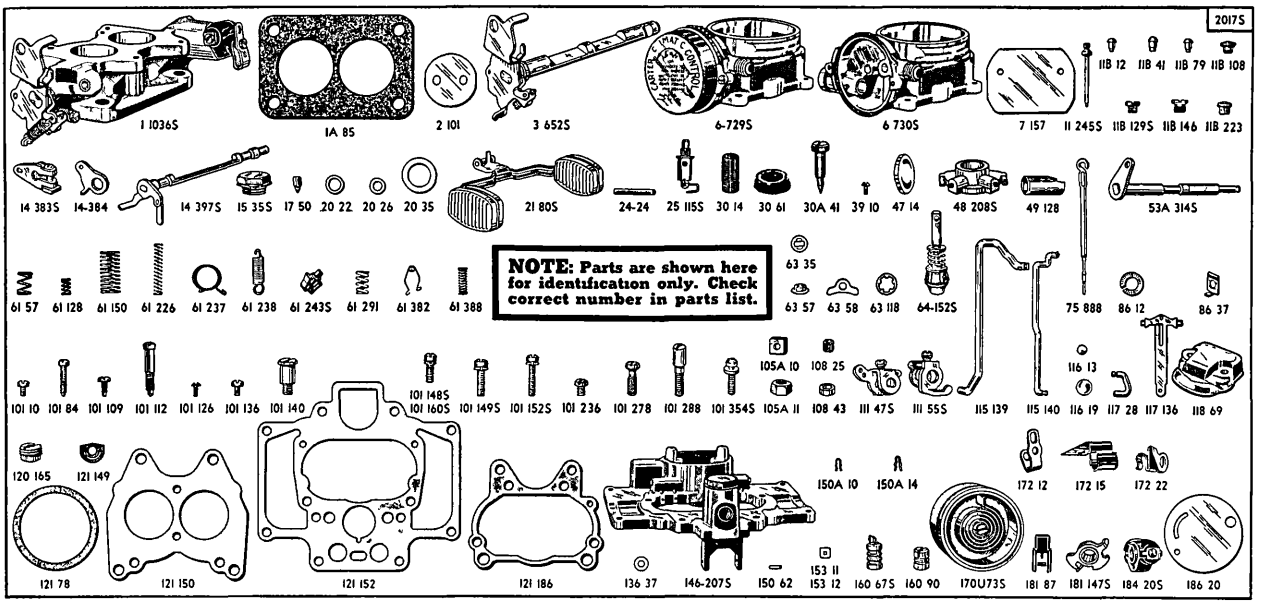
UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16 inch (gauge T109 28) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109 41)

CHECKING AND ADJUSTING STARTER SWITCH·

CAUTION· If carbureter is installed on engine make certain that transmission is in neutral and parking brake is applied

1 If carbureter is installed on Dynaflow car make certain that throttle linkage and dash pot are correctly adjusted If car bureter is removed from engine connect a 6 volt battery and test lamp across switch terminal so that lamp will light when switch makes contact

2 Back off throttle stop screw remove throttle connector rod rotate fast idle cam to slow idle position and fully close the throttle valves



3 While holding throttle valves fully closed place a scale against choke unloader arm of throttle lever and make an index mark on carbureter body at the one inch division on scale

4 With ignition switch turned on (or test lamp connected) hold end of scale against unloader arm and slowly open throttle until the drive pinion just engages flywheel ring gear (or test lamp lights)

5 If switch is correctly timed, the scale will then read be- tween 1 15/16 inch and 2 5/16 inch at mark on carbureter body (15/16 inch to 1 5/16 inch travel of arm)

6 If necessary make switch adjustment by reducing or in- creasing the total thickness of the brass shims If switch timing was found to be too early, reduce the total thickness of the shims If timing was too late, increase total thickness of shims Two sizes of shims are available 153-11 018 inch—153-12 006 inch After adjustment is completed set engine idle at speci- fied r p m

BUICK "V8" ROADMASTER

MODEL 70

1953

(2082S can also be used)

WCFB Four-Bore Down-Draft Climatic® Control **Carbureter Nos. 996S-2053S**

CARBURETER SPECIFICATIONS

For Buick 8 Cylinder Engine: 4.00 Inch Bore, 3.20 Inch Stroke

Dimensions: Flange size, 1 1/8 inch Four bore—4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi size, 1-1/16 inch I. D.

Float Level: See adjustments.

Vents: Inside, (Vertical). Bowl chamber to top of air horn (2) size No. 44 (.086 inch) drill; (996S) 2 size No. 22 (.157 inch) drill; (2053S) 2 size No. 26 (.147 inch) drill.
Outside (horizontal). Bowl chamber to atmosphere (5) No. 42 (.0935 inch) drill. In dust cover, No. 36 (.1065 inch) drill. In flange, bore to atmosphere (4) No. 36 (.1065 inch) drill.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: Jet, size No. 69 (.0295 inch) drill. By pass, size (996S) .059 inch drill; (2053S) .057 inch drill.
Economizer, size (996S) No. 56 (.0465 inch) drill; (2053S) No. 57 (.043 inch) drill.
Idle bleed, size No. 44 (.086 inch) drill.
Anti percolating jet (idle well), size No. 70 (.028 inch) drill.

Idle Port: Upper port, slot type, primary, length .110 inch; width .030 inch. Secondary, length .103 inch; width .030 inch.

Idle Port Opening: Primary (996S) .074 to .080 inch: (2053S) .057 to .063 inch. Secondary (996S) .047 to .053 inch; (2053S) .052 to .058 inch above top edge of valve with valve tightly closed.

Lower Port: Primary (for idle adjustment screw), size No. 55 (.052 inch) drill.
Secondary (no idle adjustment screw), (996S) size No. 55 (.052 inch) drill. (2053S early prod.), size .045 inch diameter; (2053S late prod.), size No. 58 (.042 inch) drill.

Set Idle Adjustment Screw: 3/4 to 1 3/4 turns open. For richer mixture turn screw out. Do not idle engine below 450 r.p.m.

Main Nozzle: Installed permanently. **Do Not Remove.** Anti percolating jet primary side (996S) No. 65 (.035 inch), secondary side No. 70 (.028 inch) drill; (2053S) primary and secondary No. 70 (.028 inch) drill.

Metering Rod: Primary: (996S) Economy step .077 inch diameter. Middle step tapers to .059 inch diameter. Power step .046 inch diameter.
(2053S) Economy step .0715 inch diameter. Middle step tapers to .058 inch diameter. Power step .053 inch diameter. (These rods designed with stabilizing flats on economy step.)
Secondary: None.

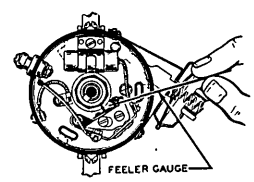
Metering Rod Jet: Primary: size (996S) .0935 inch diameter; (2053S) .089 inch diameter (for metering rod).
Secondary: size .061 inch diameter (no metering rod).

Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 74 (.0225 inch) drill. Intake ball check seat, size .115 to .120 inch diameter. Discharge needle seat, size .070 inch diameter. Relief ball check, size No. 55 (.052 inch) drill. Relief passage (vent) to fuel chamber, size No. 42 (.0935 inch) drill.

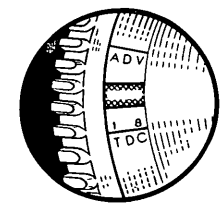
Pump Adjustment: See adjustments.

Choke: Carter Climatic ® Control, set on index. Butterfly type offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 42 (.0935 inch) drill.

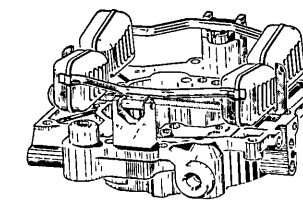


Vacuum Spark Port: 996S and (2053S early prod.), size .039 to .041 inch diameter. (2053S late production) size .080 to .082 inch diameter. Bottom of port 996S—.042 to .046 inch; 2053S early prod.—.028 to .032 inch; 2053S late prod.—.008 to .012 inch above top edge of valve with valve tightly closed.

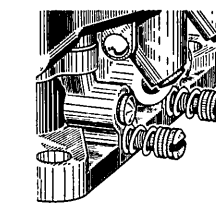
Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .030"-.035"



Breaker Point Setting .0125"-.0175"

Ignition Timing Breaker Points to Open: 5° B. T. D. C.

Float Setting
Primary 3/32 Inch
(Use Gauge T109-233)
Secondary 3/16 Inch
(Use Gauge T109-222)

Idle Adjustment Screw Setting 3/4 to 1 3/4 Turns Open

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

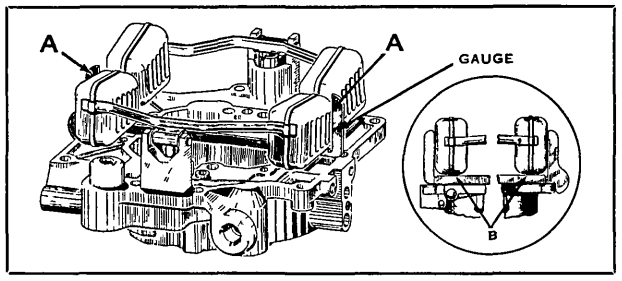

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

Two separate float adjustments must be made—lateral and vertical

Lateral Adjustment: With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge (A) Adjustment should be made by bending arms of floats

Vertical Adjustment: With float gauge in same position floats should just clear the horizontal portion of gauge Vertical distance (B) between top of float and machined surface of casting must be 3/32" (gauge T109-233) for primary floats; and 3/16" (gauge T109 222) for secondary floats Adjust by bending float arms

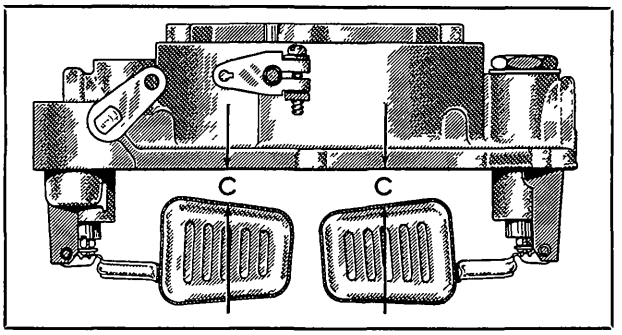

Figure 2
Float Drop Adjustment

FLOAT DROP ADJUSTMENT (Fig. 2):

With bowl cover held in upright position and measuring from center of floats, the distance (C) between top of floats and bowl cover should be 5/8" for primary floats and 11/16" for secondary floats Adjust by bending stop tabs on float bracket.

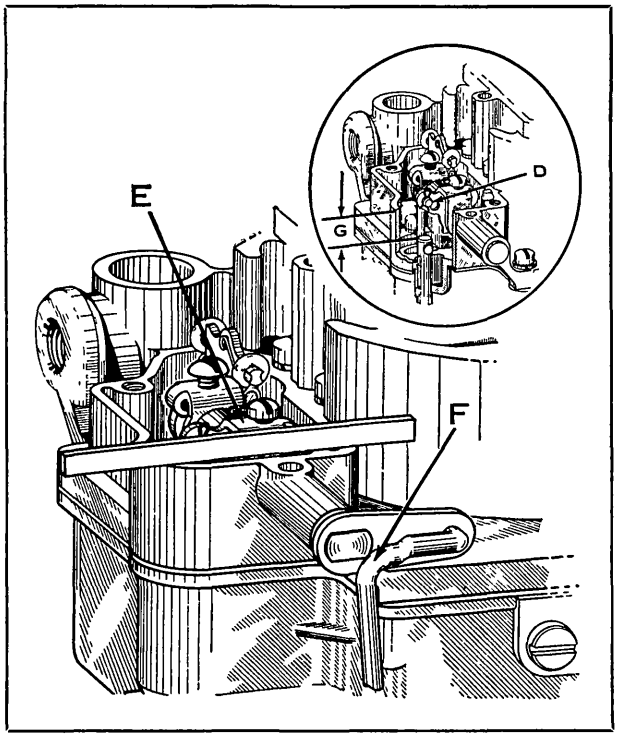

Figure 3
Pump Adjustment

PUMP ADJUSTMENT (Fig. 3):

Install pump connector link in outer hole (D) (long stroke) of pump arm, with ends extending toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm (E) should be parallel to straight edge Adjust by bending throttle connector rod at upper angle (F) (Use tool T109 213) OPTIONAL ADJUSTMENT With throttle valves seated in bores of carbureter, the distance from the top of the plunger shaft to the top of the dust cover boss should be 18/64" (G). Adjust as mentioned above

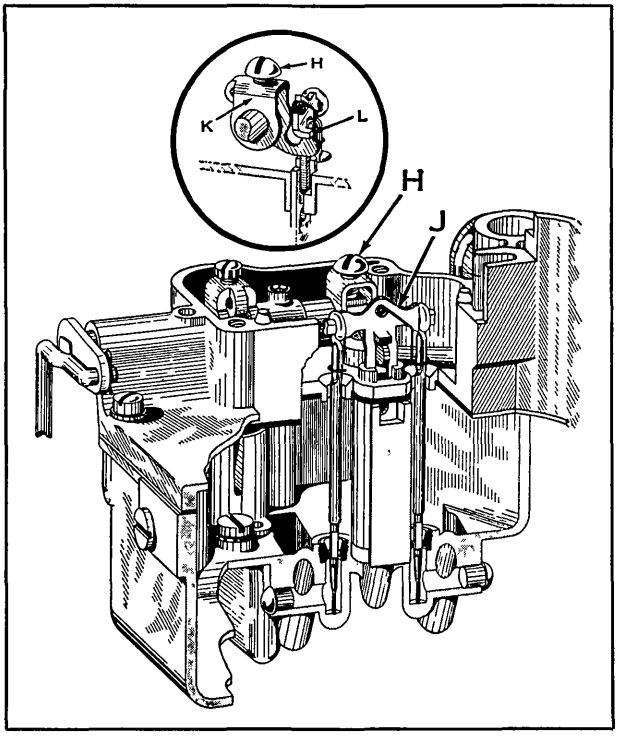

Figure 4
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 4):

Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (H) 2. With metering rods in place, press down on vacumeter link (J) until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm (K) until finger on arm contacts lip of vacumeter link (L). Hold in place and carefully tighten clamp screw (H).

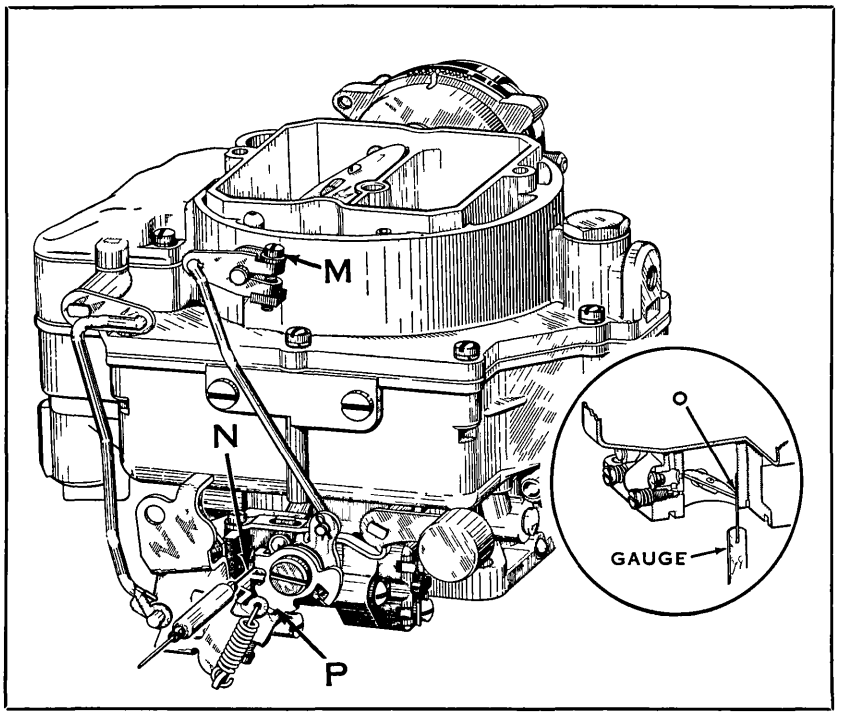

Figure 5
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig 5)

(a) Loosen choke lever clamp screw (M) on choke shaft Insert 020" feel er gauge (T109 29) (N) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing lever towards closed position —hold in place and tighten clamp screw (M)

(b) With choke valve tightly closed tighten fast idle adjusting screw until there is 020" (gauge T109 29) open ing (O) between throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjusting screw is on high step of cam (P) while mak ing this adjustment

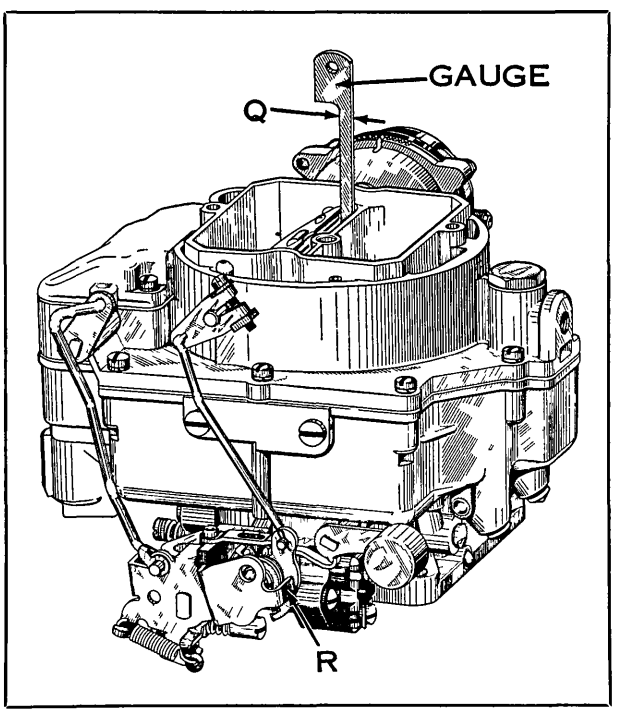

Figure 6
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig 6)

With throttle wide open there should be 3/16" clearance (Q) between upper edge of choke valve and inner wall of air horn (gauge T109 28) Adjust by bending unloader lip (R) on throttle shaft lever (use bending tool T109 41)

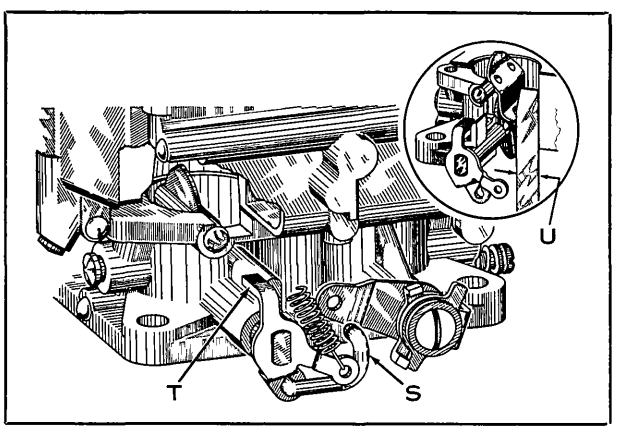

Figure 7
Auxiliary Throttle Valve Adjustment

AUXILIARY THROTTLE VALVE ADJUSTMENT (Fig 7)

(a) Disconnect secondary throttle operating rod (S)

(b) Adjust stop lug (T) on secondary throttle lever (use bending tool T109 214) until there is 27/64" clearance (U) (gauge T109 242) between lower edge of auxiliary throttle valve and bore when lug (T) is against stop on flange

181-147S	Fast idle cam assembly	
184-64S	Terminal cap assembly	
186-34	Baffle plate	
192-21U	Carter starter switch unit	

*Early production 2053S carbureters used 75 903 metering rod (identified by one trade mark) and 120 192 For service use 75 903 (identified by two trade marks) and 120 159

NOTE Figures in parentheses indicate number of pieces used in one carbureter. Where no figure is shown, only one is used

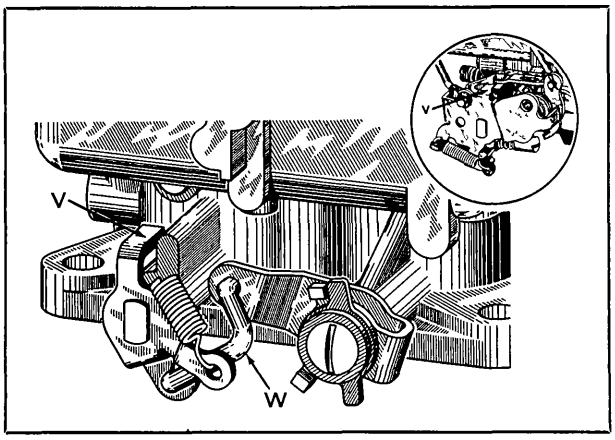

Figure 8
Secondary Throttle Lever Adjustment

SECONDARY THROTTLE LEVER ADJUSTMENT (Fig. 8):
The stop lug (V) on both primary and secondary throttle levers should contact boss on flange at the same time. To adjust bend secondary throttle operating rod at angle (W) (use bending tool T109-213). NOTE: Secondary throttle valves will be a few degrees from wide open position.

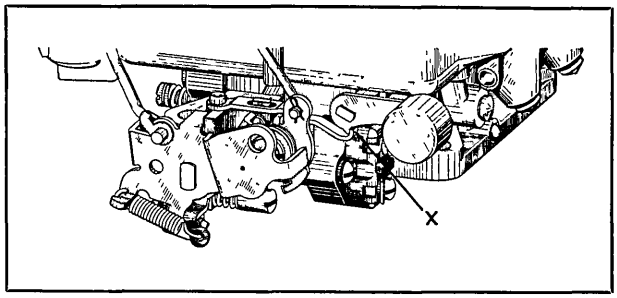

Figure 9
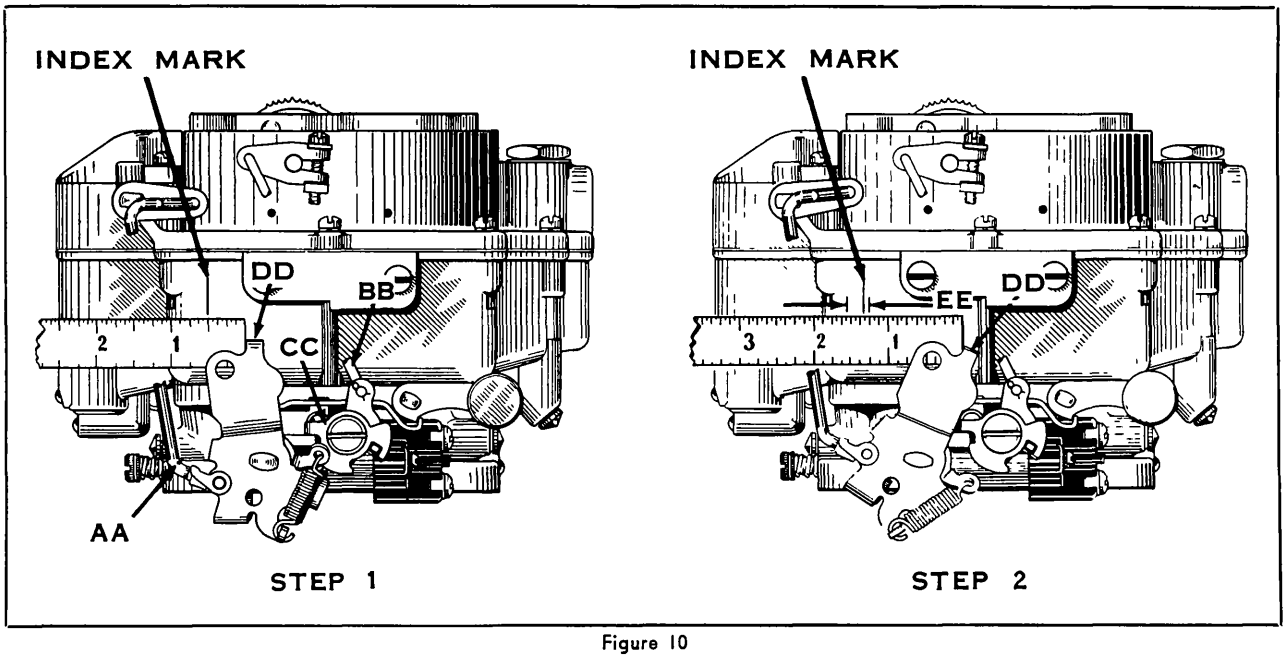
Auxiliary Throttle Lock-Out Adjustment

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 9):
This adjustment should be made after completing fast idle adjustment. 1. With choke valve closed, edge of hook (X) on lock-out arm should contact auxiliary throttle lever, making maximum contact of locking step on lever. 2. Open choke valve. Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position. Adjust by bending lock-out arm.



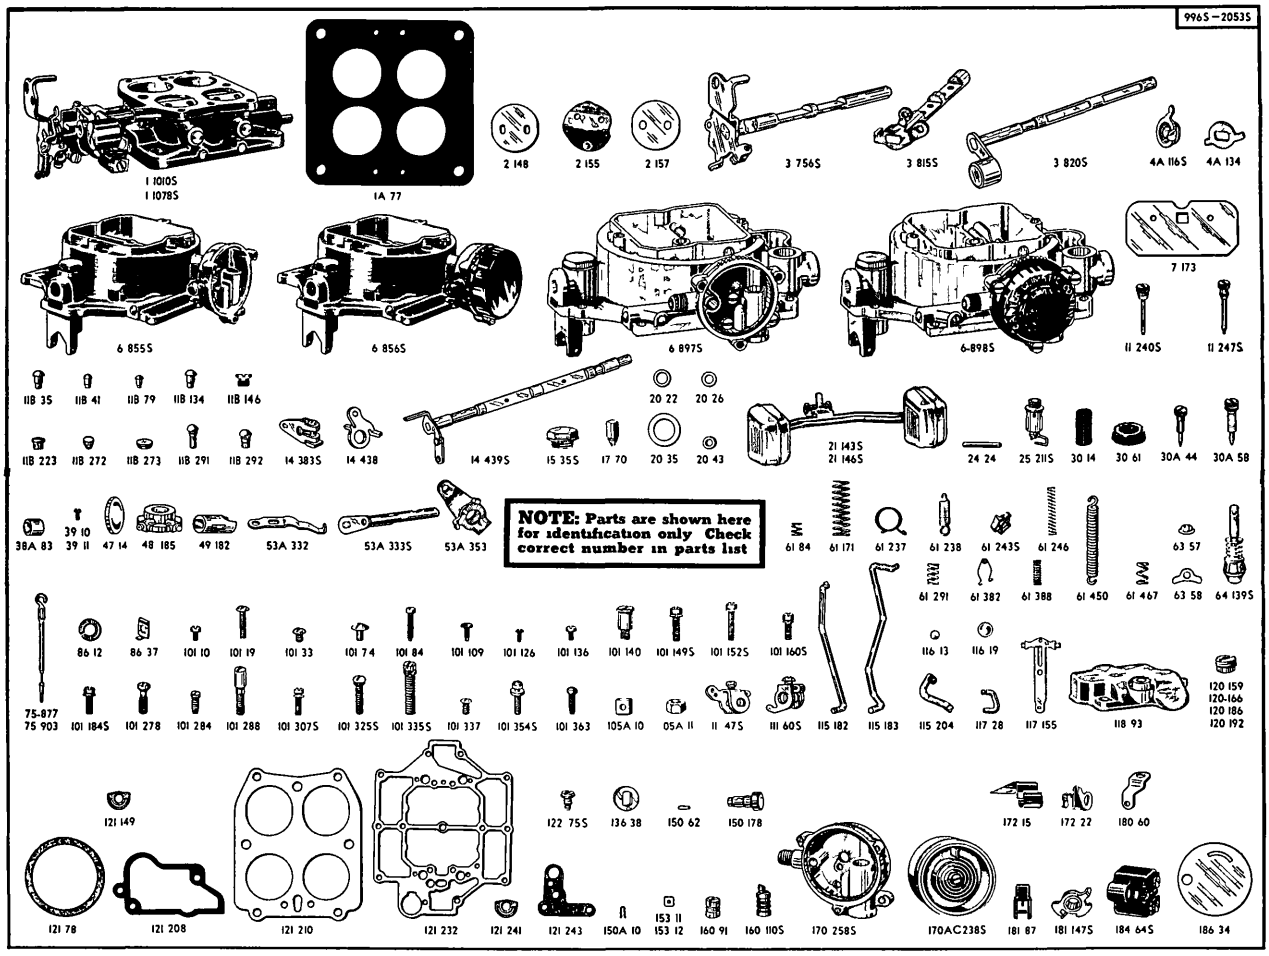


Figure 10
Checking and Adjusting Starter Switch

CHECKING AND ADJUSTING STARTER SWITCH (Fig. 10):

(CAUTION): If carbureter is installed on engine, make certain that the transmission is in neutral and parking brake is applied. 1. If carbureter is installed on Dynaflow car, make certain that throttle linkage and dash pot are correctly adjusted. If carbureter is removed from engine, connect a 6-volt battery and test lamp across switch terminal, so that lamp will light when switch makes contact. 2. Back off throttle stop screw, remove throttle connector rod (AA) and choke connector rod (BB), rotate fast idle cam (CC) to slow idle position, and fully close the throttle valves. 3. While holding throttle valves fully closed, place a scale against choke unloader arm of throttle lever and make an index mark on carbureter body at the 1/2" division of scale. 4. With ignition switch turned on (or test lamp connected) hold end of scale against unloader arm (DD) and slowly open throttle until the drive pinion just engages flywheel ring gear (or test lamp lights). 5. If switch is correctly timed, the scale will then read between 1 1/4" and 1-9/16" at mark on carbureter body (EE) (3/4" to 1-1/16" travel of arm). 6. If necessary, make switch adjustment by reducing or increasing the total thickness of the brass shims. If switch timing was found to be too early, reduce the total thickness of the shims. If timing was too late, increase total thickness of shims. Two sizes shims are available: 153-11, .018"; 153-12, .006". After adjustment is completed, set engine idle at specified R.P.M.

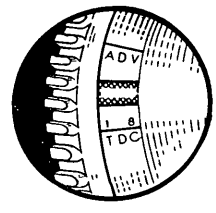
Idle bleed size: (725S-SA-726S-SA) 1.35 mm (.0531") drill; (882S-882SA) No. 38 (2.58 mm) drill; (883S) No. 47 (1.99 mm) drill.
Idle Ports: (725S-SA-882S-882SA) Upper port, slot type, length, 103 inch (2.62 mm), (726S-SA-883S) .115 inch (2.92 mm); width, .030 inch (.76 mm).
Idle Port Opening: (725S-SA) .062-.068 inch (1.58-1.73 mm), (726S-SA-883S) .072 to .078 inch (1.83 to 1.98 mm), (882S-882SA) .052 to .058 inch (1.32 to 1.47 mm) above upper edge of valve with valve tightly closed.
Lower Port (For Idle Adjustment Screw): Size .0615 to .0655 inch (1 56 to 1 66 mm) diameter.
Set Idle Adjustment Screw: See illustration.
Vacuum Spark Port: .039 to .041 inch (.99 to 1.04 mm) diameter. (725S-SA-882S-882SA) Bottom of port .046 to .050 inch (1.17 to 1.27 mm) above valve, (726S-SA-883S) .060 to .064 inch (1.52 to 1.62 mm) above valve.
Main Nozzle: Installed permanently. **DO NOT REMOVE.**
Metering Rod: (725S-SA-882S-882SA) Economy step, .06425 inch (1.63 mm) diameter. Middle step tapers to .059 inch (1.50 mm) diameter Power step 049 inch (1 25 mm) diameter.
(726S-SA-883S) Economy step, .061 inch (1 55 mm) diameter. Middle step tapers to 054 inch (1.37 mm) diameter., Power step 040 inch (1.02 mm) diameter.
(These rods designed with idle stabilizing flat on economy step)
Metering Rod Jet: .082 inch (2.08 mm) diameter.
Metering Rod Setting: See adjustments, page 2.
Accelerating Pump: Adjustable stroke.
Discharge jet (twin) size, No. 74 (.57 mm) drill.
Intake ball check size, No. 32 (2.95 mm) drill
Discharge (needle seat) size, No 50 (1.78 mm) drill.
Relief ball check size, No. 55 (1.32 mm) drill.
Pump Adjustment: See adjustments, page 2
Choke: Carter Climatic ® Control, set one point rich. Butterfly type, offset valve. Choke heat suction hole, in bowl cover, size No. 42 (2.38 mm) drill.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT:

Three separate float adjustments must be made—lateral, vertical and float drop.

Lateral Adjustment: With bowl cover assembly inverted, bowl cover gasket removed and float lip resting on seated needle, place float gauge T109-196 directly under float with notched portions of gauge fitted over edges of casting. Sides of floats should barely touch the vertical uprights of float gauge. Adjustment should be made by bending arms of floats.

Vertical Adjustments: With float gauge in same position, floats should just clear the horizontal portion of gauge. (Vertical distance between top of float and machined surface of casting must be 5/32"). Adjust by bending float arms. Remove float, install bowl cover gasket and then reinstall float.

PUMP ADJUSTMENT: (Fig. 1)

The total distance the plunger head (not shaft) moves from closed to wide open throttle position controls the amount of fuel discharged. Correct pump plunger travel is important and should be checked each time the carbureter is disassembled or when leaner than standard metering rods are installed Procedure is as follows:

Install pump connector link in lower hole (short stroke) of pump arm (A), with ends extending away from countershaft arm. Back out **throttle lever set screw** until throttle valves seat in bores of carbureter. Be sure fast idle adjusting screw does not hold throttle open. Place universal pump travel gauge T109-117S, inverted on edge of dust cover boss of bowl cover Turn knurled nut of gauge until finger (B) just touches upper end of plunger shaft. Number indicated on gauge should be "33". Hold the gauge vertical to insure correct reading Adjust by bending the throttle connector rod at upper angle (C). Optional Adjustment: With throttle valves seated in bores of carbureter, the distance from the top of the plunger shaft to the top of the dust cover boss should be 20/64 inches Adjust as mentioned above.

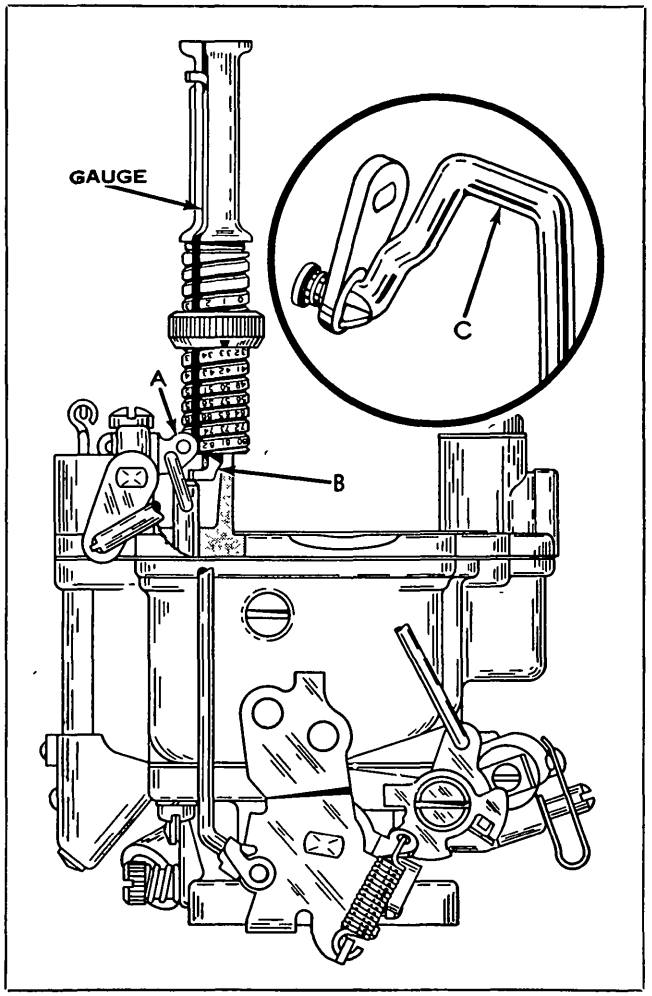

Figure 1

METERING ROD ADJUSTMENT: (Fig. 2)

Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows:

1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (D).
2. With metering rods in place, press down on vacumeter link (E) until metering rods bottom in carbureter body casting (F).
3. Holding rods in downward position and throttle valves seated revolve metering rod arm (G) until finger on arm contacts lip (H) of vacumeter link. Hold in place and carefully tighten clamp screw (D).

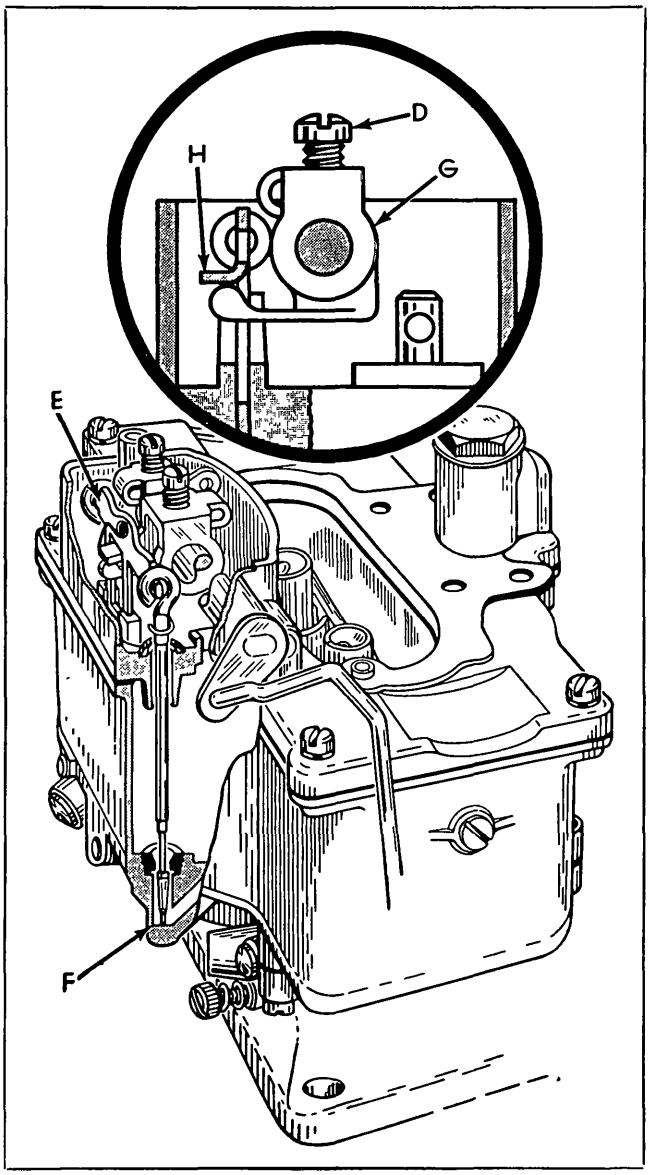

Figure 2

FAST IDLE ADJUSTMENT (Fig 3)

A. Loosen choke lever clamp screw (J) on choke shaft Insert 020" feeler gauge T109-29 between lip of fast idle cam and boss of flange casting (K) Hold choke valve tightly closed and take slack out of linkage by pressing choke lever (L) towards closed position—hold in place and tighten clamp screw (J) B. With choke valve tightly closed tighten fast idle adjusting screw (M) until there is 015" opening (N) (725S-SA 883S) 018" (726S SA) (use gauge T109 44) 012" (882S-882SA) (use gauge T109 200) between throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjust ng screw is on high step of cam (P) while making this adjustment

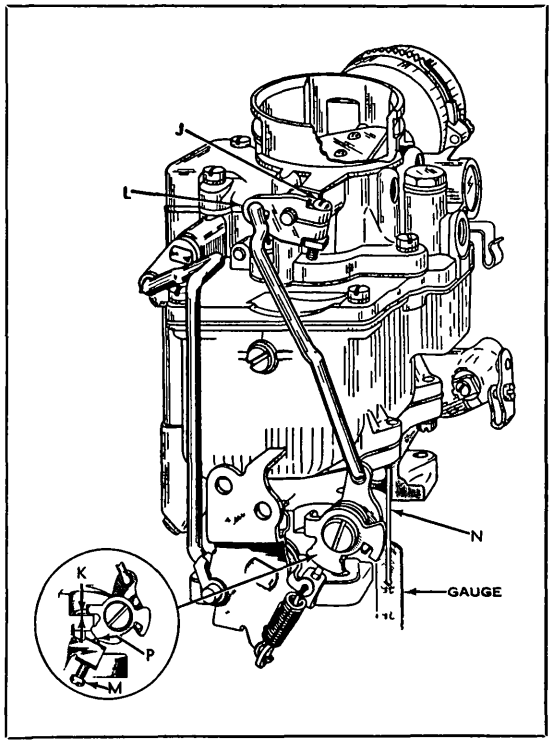

Figure 3

STARTER SWITCH (Fig 5)

The Carter Car Starter is incorporated as an integral part of the carbureter A steel ball (1) rests in a milled groove in the throttle shaft When the throttle is opened with the engine stopped the ball is forced against the plunger (2) which moves bakelite guide (3) and switch contactor spring assembly (5) (shaped like the letter W) upward until it makes an electrical contact between two brass inserts molded in the bakelite terminal cap (7) This is the switch in the solenoid circuit which operates the cranking motor

When the engine starts, the manifold vacuum acts on the steel ball and as soon as the foot throttle is released the ball is forced upward and away from the shaft spring (6) pushes the contact spring downward, thus breaking the circuit The ball is forced upward to its seat in the casting and remains in the upper position as long as the engine is in operation Any additional operation of the throttle does not cause switch to again make contact until the engine is stopped which will allow the ball to again drop to its starting position

The W shaped contactor spring assembly (5) rests on two or more square brass shims (4) These are very important because they determine the degree of throttle opening at which the switch contact is made Contact should be made when throttle valve is opened between 30° and 45° from fully closed position If not enough of these shims are in place contact will not be made soon enough If there are too many shims used the switch will make contact too soon (before 30°) and in that case there is danger that the switch circuit may be closed during fast idle operation Qualification of the switch must not require less than one 153 11 (4) (018" shim) nor more than three 153 11 (4) and two 153 12 (4) (006" shims)

The W shaped contactor spring assembly (5) consists of the W spring and a round washer with a square hole Do not confuse with shims CAUTION THE CONTACTOR SPRING ASSEMBLY AND CYLINDRICAL SPRING (6) MUST NEVER BE STRETCHED OR ALTERED IN ANY WAY AS OPERATION OF THE SWITCH WILL BE AFFECTED

To remove the throttle shaft from the carbureter it is necessary to first remove the starting switch complete Never oil or grease any switch part as it will collect dust and eventually stick

UNLOADER ADJUSTMENT (Fig 4)

With throttle wide open there should be 3/16" clearance (R) between upper edge of choke valve and inner wall of air horn (gauge T109 28) Adjust by bending unloader lip (S) on throttle shaft lever (use bending tool T109 41)

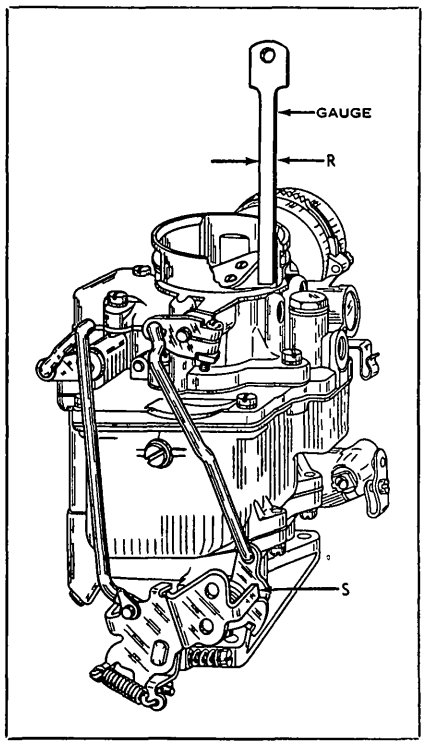

Figure 4

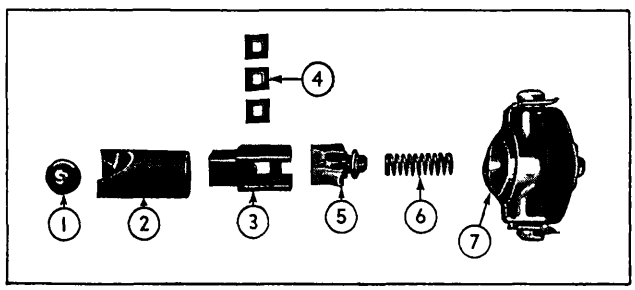

Figure 5

BOWL VENT CHANGES — 725S AND 726S CARBURETERS

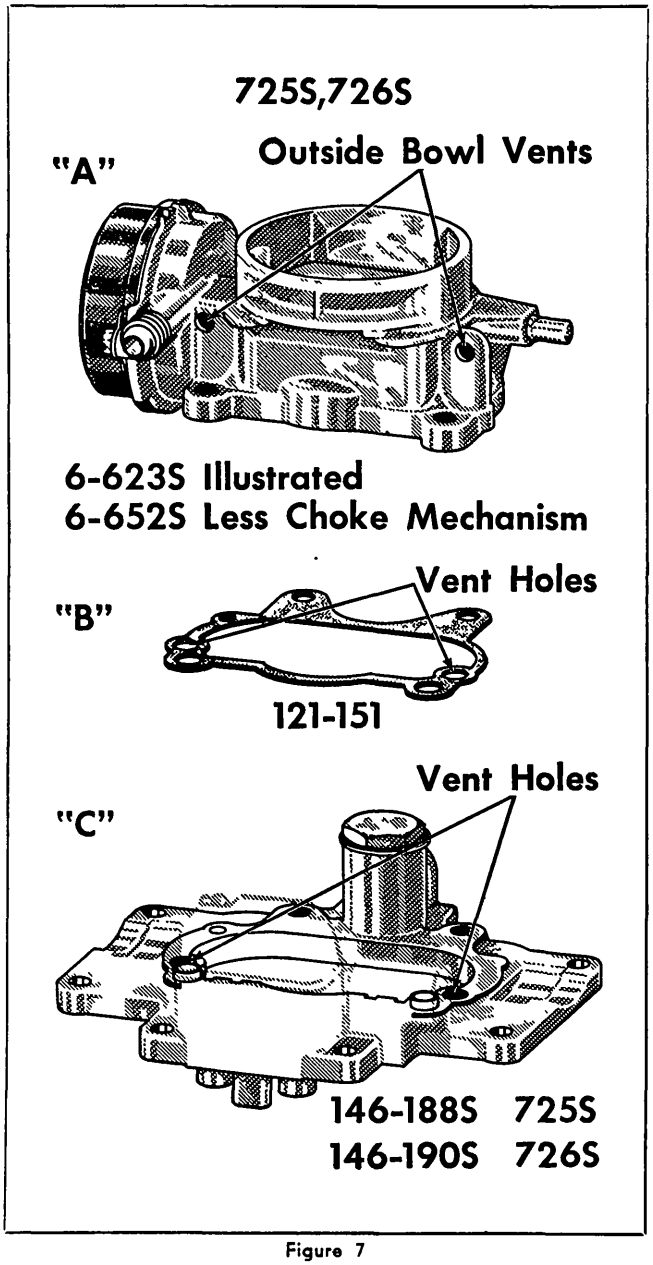

Figure 7

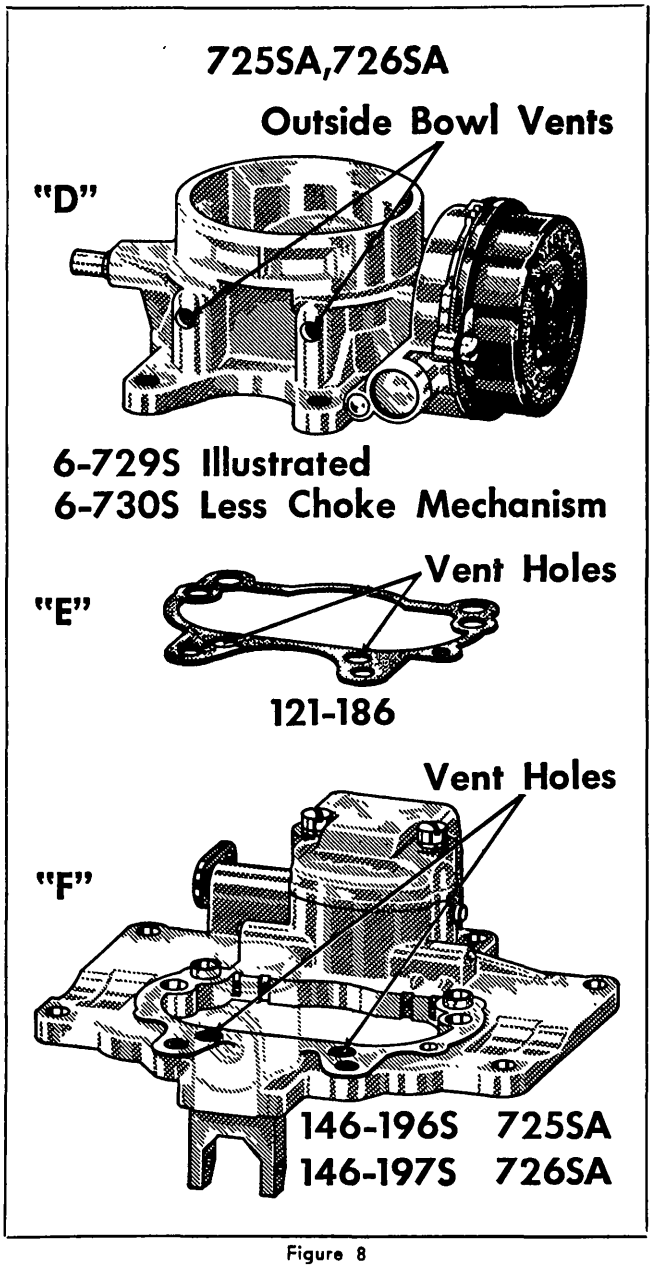

Figure 8

725S and 726S have outside bowl vents (A) (Figure 7) located in the air horn **on the side opposite the fuel inlet** of the carbureter. When the carbureters were changed to 725SA and 726SA the outside bowl vents (D) (Figure 8) were located **on the gasoline inlet side** of the carbureter.

It is important that the correct air horn, air horn gasket and bowl cover combinations be used so that the fuel bowl is vented to atmosphere, otherwise a poor performance complaint at speeds above 10 MPH will result.

The new style air horn (D) (Figure 8), air horn gasket (E) and bowl cover (F) supersede the older types (A, B and C). When installing air horn assembly "D" on 725S or 726S carbureters, two (2) 1/4 inch vent holes are to be drilled in the bowl cover, using the new gasket 121-186 (E) as a template.

The early type air horn (A), air horn gasket (B) and bowl cover (C) are satisfactory for use on 725S and 726S carbureters.

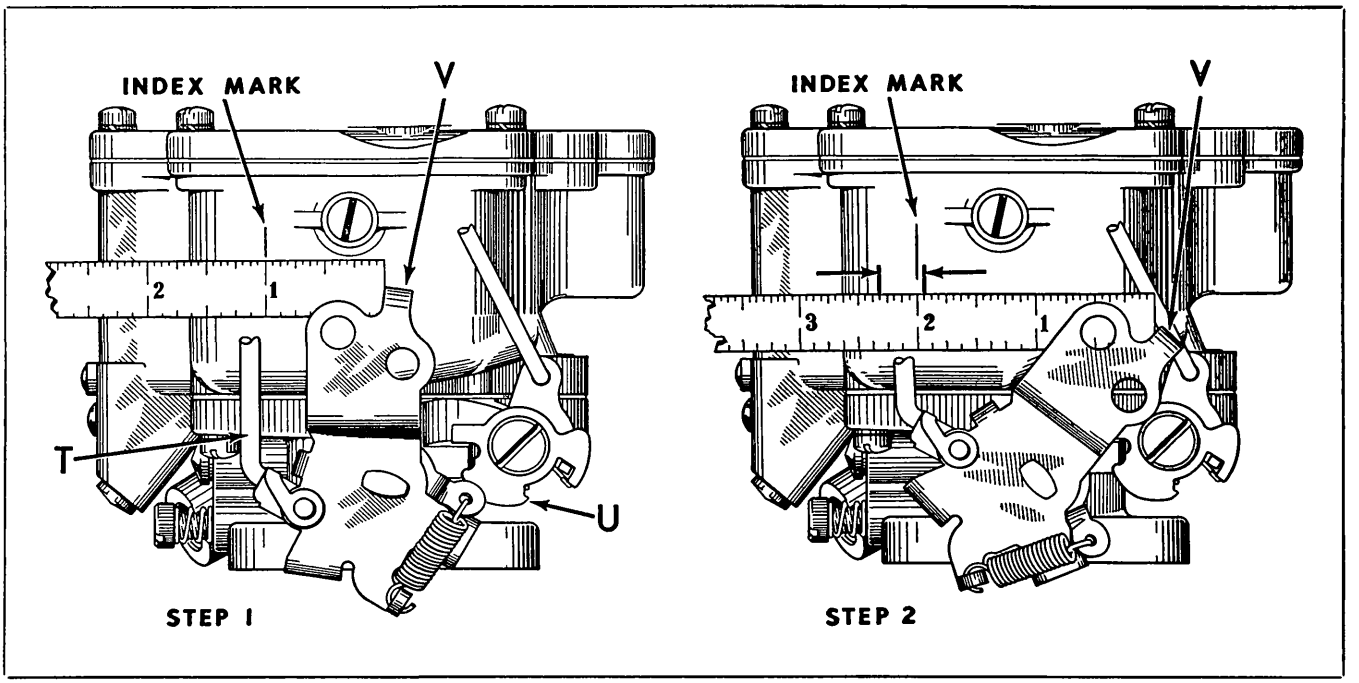

Figure 6

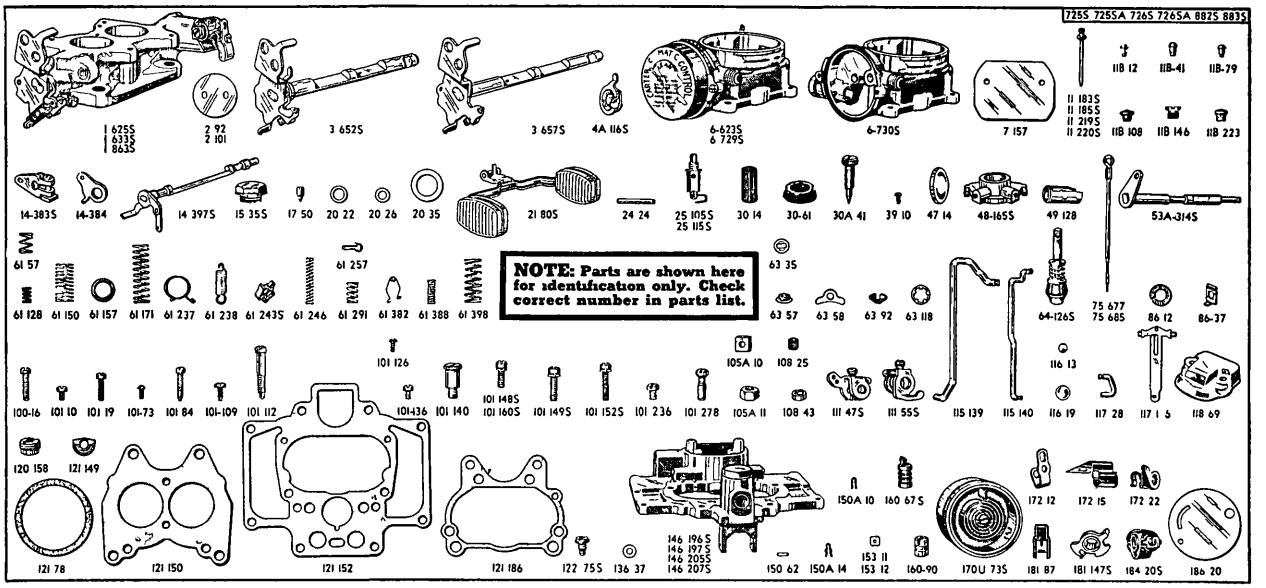
CHECKING AND ADJUSTING STARTER SWITCH (Fig 6)

CAUTION: If carbureter is installed on engine make certain that the transmission is in neutral and parking brake is applied

1 If carbureter is installed on Dynaflow car make certain that throttle linkage and dash pot are correctly adjusted (See Buick Shop Manual)

If carbureter is removed from engine connect a 6 volt battery and test lamp across switch terminal, so that lamp will light when switch makes contact

2 Back off **throttle stop screw,** remove throttle connector rod (T) rotate fast idle cam (U) to slow idle position if necessary and fully close the throttle valves



3 While holding throttle valves fully closed, place a scale against choke unloader arm (V) of throttle lever and make an index mark on carbureter body at the one inch division on scale See Figure 6 Step 1

4 With ignition switch turned on (or test lamp connected) hold end of scale against unloader arm (V) and slowly open throttle until the drive pinion just engages flywheel ring gear (or test lamp lights)

5 If switch is correctly timed, the scale will then read between 1-15/16" and 2 5/16" at mark on carbureter body (15/16" to 1 5/16" travel of arm) See Figure 6 Step 2

6 If necessary, make switch adjustment by reducing or increasing the total thickness of the brass shims No 4 in Figure 5

If switch timing was found to be too early reduce the total thickness of the shims If timing was too late increase total thickness of shims Two sizes of shims are available 153 11 018" — 153 12 006" After adjustment is completed set engine idle at RPM noted under carbureter specifications

PARTS LIST

Buick Carbureters Nos. 725S-725SA-726S-726SA-882S-882SA-883S

WHEN SERVICING, USE GASKET ASSORTMENT No 195A, REPAIR PKG. No. 1515D (725S-SA)

NOTE: Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown, only one is used.

BUICK ROADMASTER MODEL "70" 1952

WCFB Four-Bore Down-Draft Climatic® Control **Carbs. Nos. 894S-894SA-894SC**

CARBURETER SPECIFICATIONS

For Buick 8 Cylinder Engine 3 7/16 Inch Bore, 4 5/16 Inch Stroke

Dimensions Flange size 1 1/8 inch Four Bore—4 bolt type
Primary venturi size 11/32 inch I D
Main venturi size 1 1/16 inch I D

Float Level See adjustments

Vents (894S and 894SA Early Production) Outside bowl chamber to atmosphere (3) No 42 (0935 inch) drill Inside to bowl chamber (2) No 42 (0935 inch) drill and (2) 3/16 inch diameter (894SA Late Production) Outside bowl chamber to atmosphere (5) No 42 (0935 inch) drill (1) No 36 (1065 inch) drill Inside to bowl chamber (2) No 42 (0935 inch) drill and (2) 3/16 inch diameter In dust cover (1) No 36 (1065 inch) drill In flange bore to atmosphere (4) No 36 (1065 inch) drill

Gasoline Intake Size No 42 (0935 inch) drill hole in needle seat

Low Speed Jet Tube Jet size No 69 (02925 inch) drill
By pass size 0591 inch drill
Economizer size 04895 inch drill
Idle bleed size No 43 (89 inch) drill

Idle Port (Upper) Slot type Primary length 156 inch width 030 inch Secondary length 103 inch width 030 inch

Idle Port Opening Primary 067 to 073 inch secondary 046 to 053 rch above upper edge of valve with valve tightly closed

Lower Port Primary (For Idle Adjustment Screw) Size No 55 (052 inch) drill
Secondary (No Idle Adjustment Screw) Size No 55 (052 inch) drill

Set Idle Adjustment Screw 1/4 to 1 1/4 turns open For richer mixture turn screw out Do not idle engine below 450 R P M

Main Nozzle Installed permanently **Do not remove**

Metering Rod Primary economy step 068 inch diameter Middle step tapers to 055 inch diameter Power step 053 inch diameter (These rods designed with stabilizing flats on economy step)
Secondary None

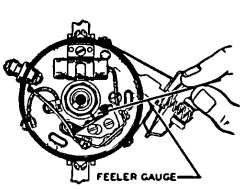
Metering Rod Jet Primary size 086 inch diameter (for metering rod) Secondary size 0635 inch diameter (no metering rod)

Metering Rod Setting See adjustments

Accelerating Pump Discharge jet (twin) primary side only size No 74 (0225 inch) drill Intake ball check seat size 115 to 120 inch diameter Discharge needle seat size 070 inch diameter Relief ball check size No 55 (052 inch) drill Relief passage (vent) to fuel chamber No 42 (0935 inch drill

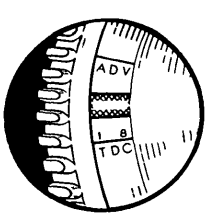
Pump Adjustment See adjustments

Choke Carter Climatic® Control set on index Butterfly type offset choke valve primary side only Choke heat suction hole restriction in piston housing size No 42 (0935 inch) drill

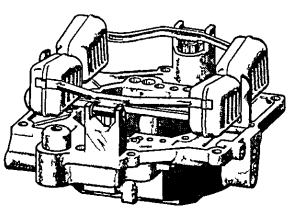


Vacuum Spark Port 039 to 041 inch diameter Bottom of port 046 to 050 inch above valve with valve tightly closed

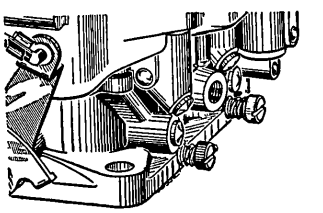
MOTOR TUNE-UP—BE ACCURATE!



CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap 025"



Breaker Point Setting 015"

Ignition Timing Breaker Points to Open 6° B T D C

Float Setting See Adjustments

Idle Adjustment Screw Setting 1/4 to 1 1/4 Turns Open

CARBURETER ADJUSTMENTS

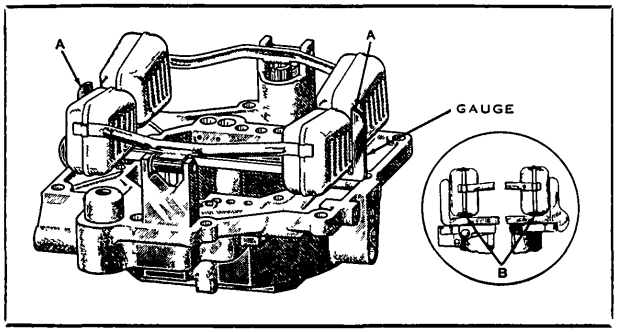

Figure 1
Float Adjustment

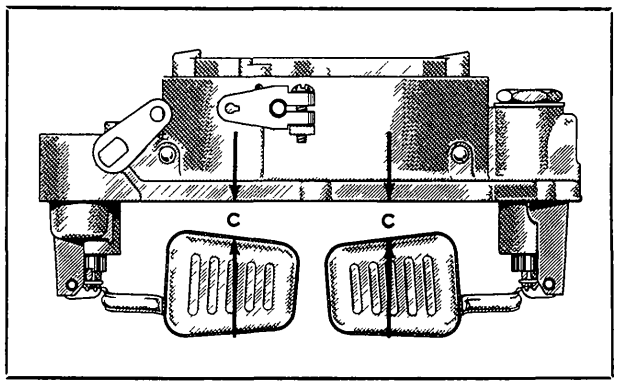

Figure 2
Float Drop Adjustment

FLOAT ADJUSTMENT (Fig 1)

Two separate float adjustments must be made—lateral and vertical

Lateral Adjustment With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Sides of floats should just clear the vertical uprights of float gauge (A) Adjustment should be made by bending arms of floats

Vertical Adjustment (Early Production—floats without vertical ribs) With float gauge in same position floats should just clear the horizontal portion of gauge The vertical distance (B) between top of float and machined surface of casting must be 1/4" for primary floats (gauge T109 223) and 3/8" for secondary floats (gauge T109 224) (Late Production—floats with vertical ribs) The vertical distance between top of float and machined surface of casting must be 3/32" (gauge T109 233) for primary floats and 1/4" (gauge T109 223) for secondary floats Adjust by bending float arms

FLOAT DROP ADJUSTMENT (Fig 2)

With bowl cover held in upright position and measuring at center of float the distance (C) between top of floats and bowl cover should be 3/4" for primary floats early production (without vertical ribs) 5/8" late production (with vertical ribs) and 7/8" for secondary floats early production 3/4" for late production Adjust by bending stop tabs on float brackets

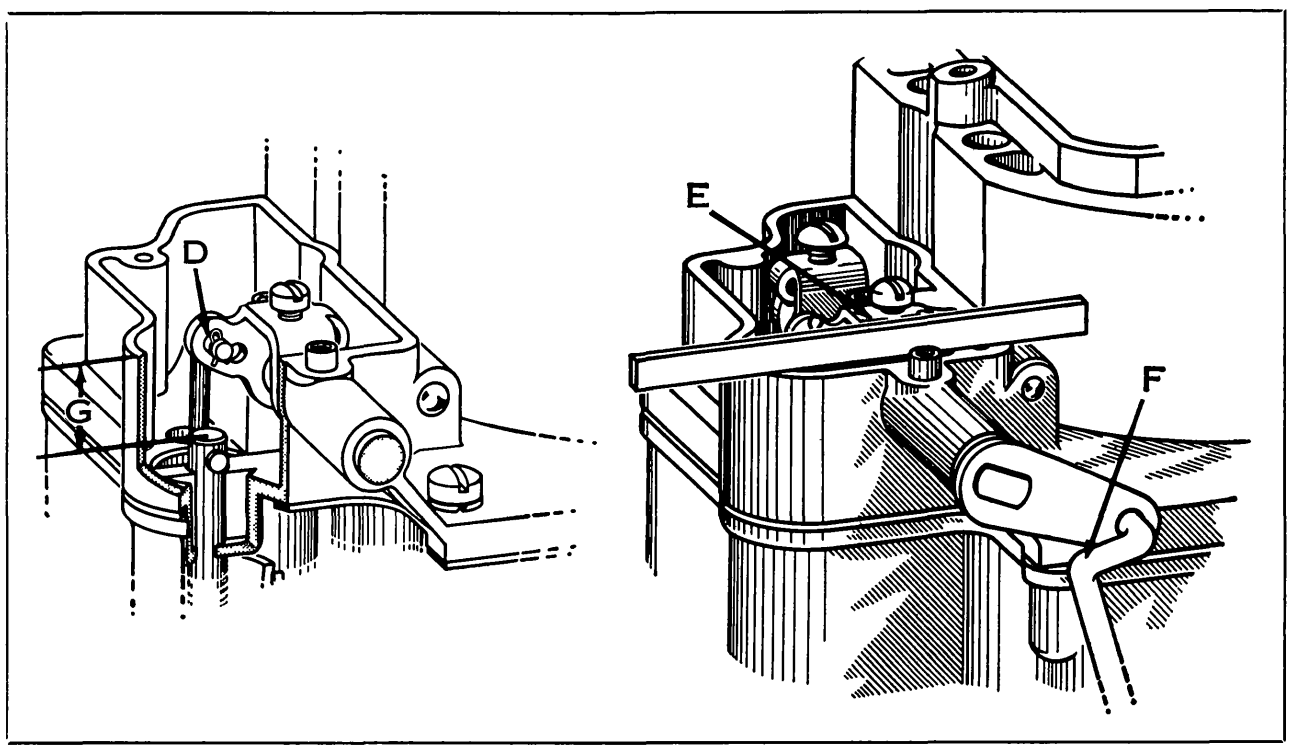

Figure 3
Pump Adjustment

PUMP ADJUSTMENT (Fig 3)

Install pump connector link in outer hole (D) (long stroke) of pump arm with ends extending toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm (E) should be parallel to straight edge Adjust by bending throttle connector rod at upper angle (F) (Use tool T109 213) OPTIONAL ADJUSTMENT With throttle valves seated in bores of carbureter the distance from the top of the plunger shaft to the top of the dust cover boss should be 9/32" (G) Adjust as mentioned above

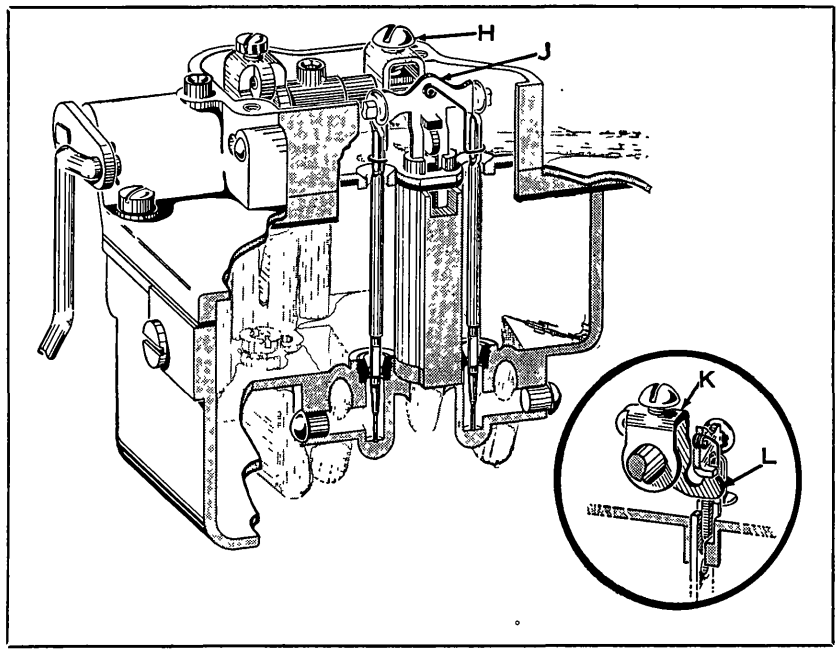

Figure 4
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 4):

Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (H). 2. With metering rods in place, press down on vacumeter link (J) until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm (K) until finger on arm contacts lip of vacumeter link (L). Hold in place and carefully tighten clamp screw (H).

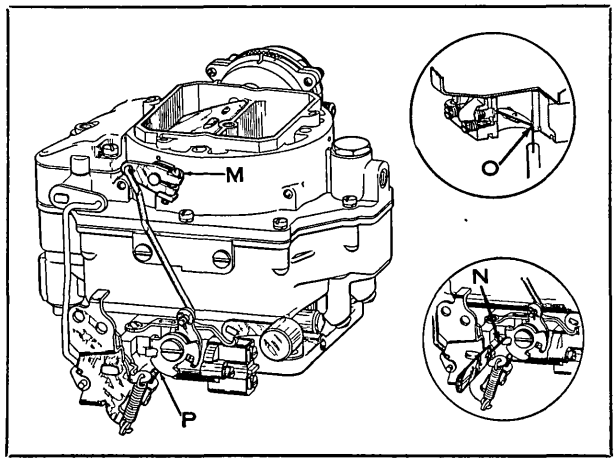

Figure 5
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 5):

(a) Loosen choke lever clamp screw (M) on choke shaft. Insert .020" feeler gauge T109-29 (N) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (M).

(b) With choke valve tightly closed, tighten fast idle adjusting screw until there is .020" opening (O) between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam (P) while making this adjustment.

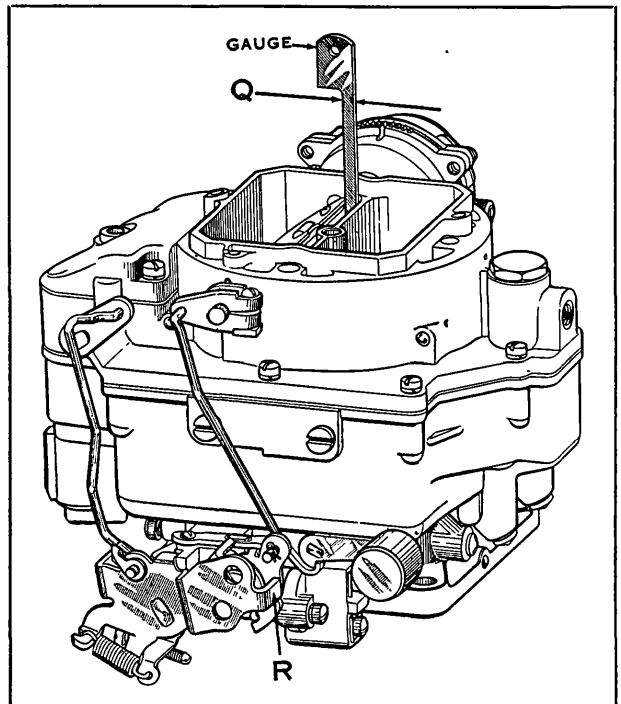

Figure 6
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 6):

With throttle wide open there should be 3/16" clearance (Q) between upper edge of choke valve and inner wall of air horn (gauge T109-28). Adjust by bending unloader lip (R) on throttle shaft lever (use bending tool T109-41).

BOWL VAPOR VENT ADJUSTMENT (Early Production 894S Only):

Place .020" feeler gauge T109-29 between the lower edge of throttle valve and bore of carbureter. Vapor relief arm should just contact ball. If necessary, adjust by bending vapor vent arm.

Part No	PART NAME

192-21U	Carter starter switch unit	

*For modification of 894S carbureter to 894SA Complete instructions for this modification contained in each unitized package

★Use with flange 1 881S (Identify by casting No 1 870 on side of flange)

†Use with flange 1 1090S (Identify by casting No 1 990 on side of flange)

NOTE **Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown only one is used**

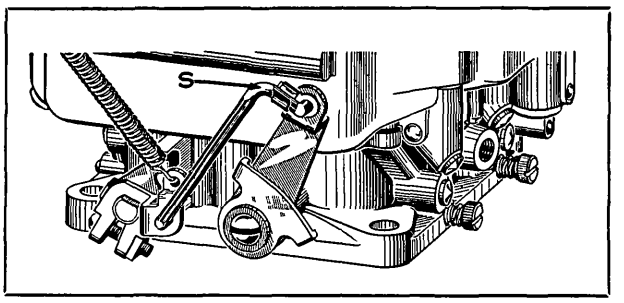

Figure 7
Secondary Throttle Lever Adjustment

SECONDARY THROTTLE LEVER ADJUSTMENT (Fig 7)

Primary and secondary throttle valves should reach wide open position at the same time To adjust Bend throttle operating rod at upper angle (S) (Use bending tool T109 213)

AUXILIARY THROTTLE LOCK OUT ADJUSTMENT (Fig 8)

This adjustment should be made after completing fast idle adjustment 1 With choke valve closed end of hook (T) on lock out arm should contact auxiliary throttle lever mak ng maximum contact of locking step on lever 2 Open choke valve Auxiliary throttle valve should become unlocked a few degrees before the choke reaches w de open position Adjust by bending lock out arm

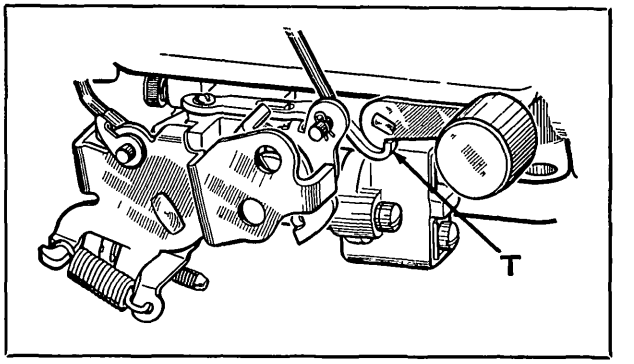

Figure 8
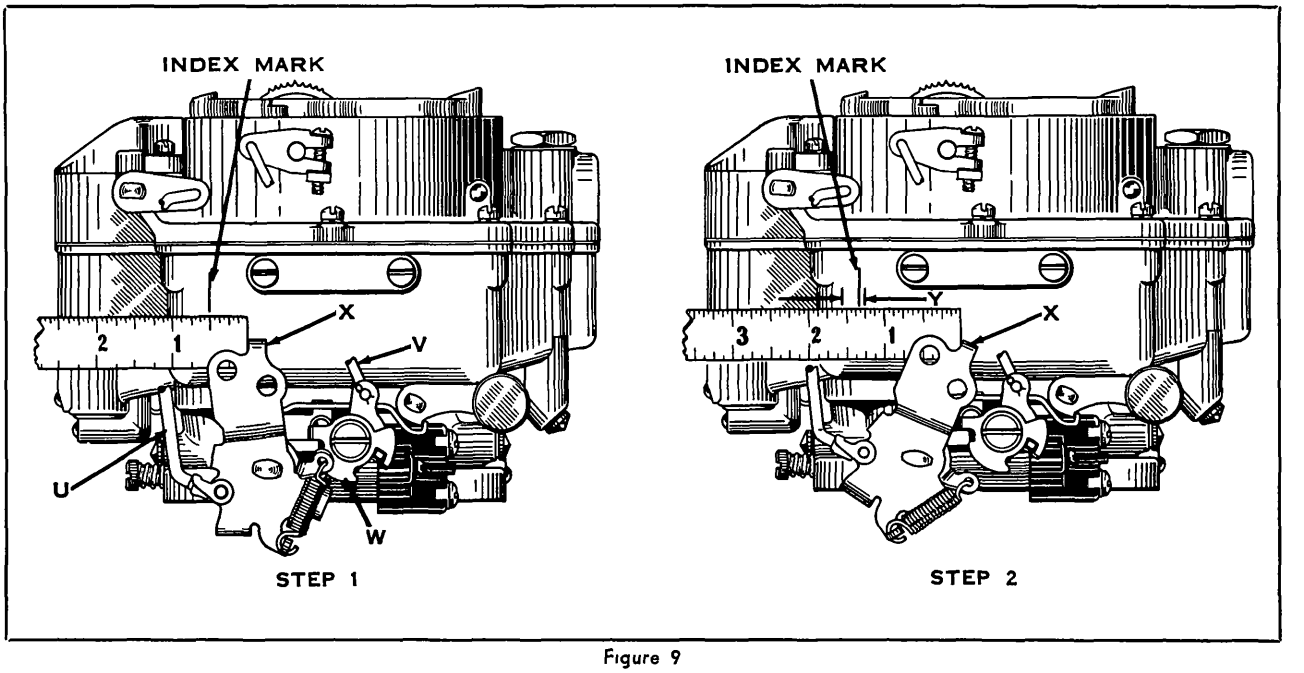
Auxiliary Throttle Lock Out Adjustment



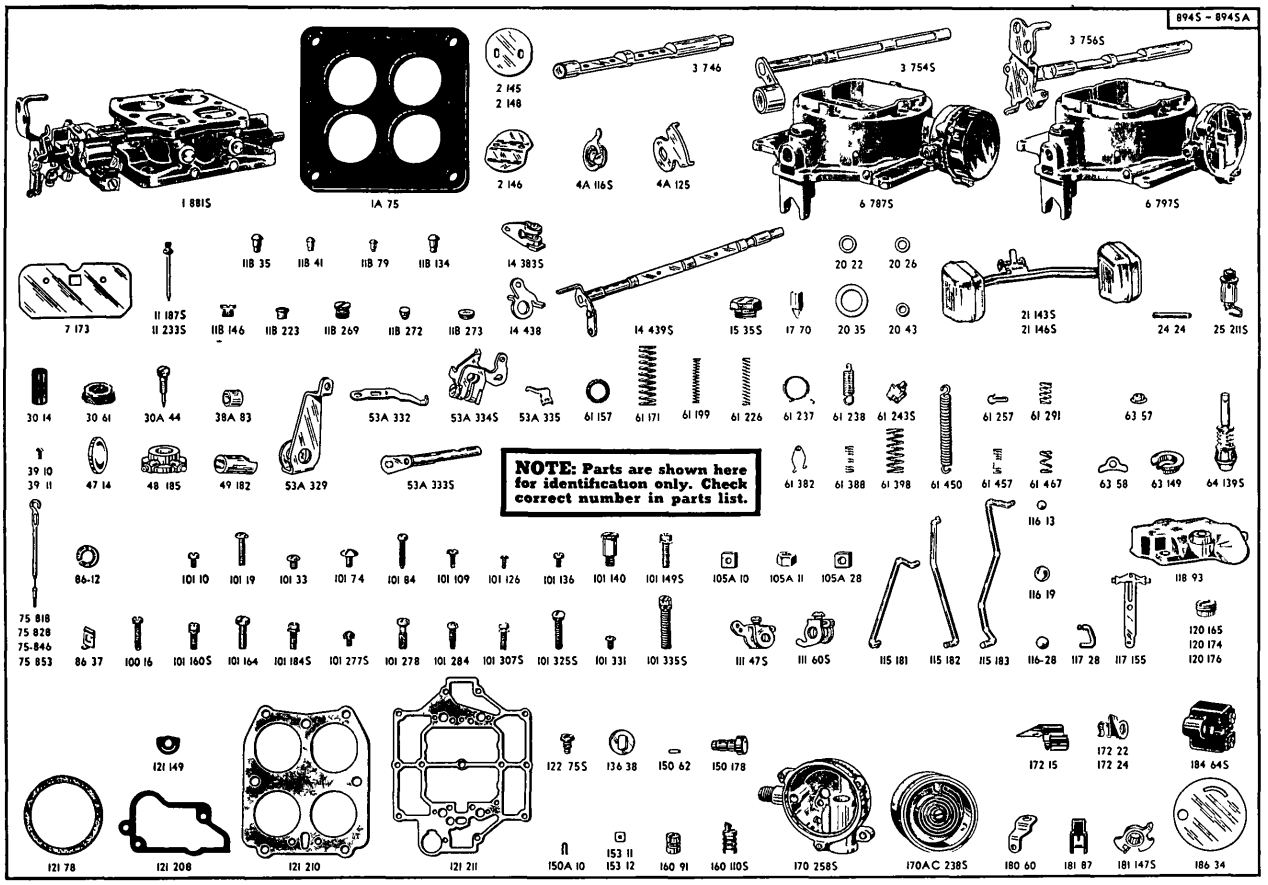


Figure 9
Checking and Adjusting Starter Switch

CHECKING AND ADJUSTING STARTER SWITCH (Fig 9)

CAUTION If carbureter is installed on engine make certain that the transmission is in neutral and parking brake is applied 1 If carbureter is installed on Dynaflow car make certain that throttle linkage and dash pot are correctly adjusted If carbureter is removed from engine connect a 6 volt battery and test lamp across switch terminal so that lamp will light when switch makes contact 2 Back off throttle stop screw remove throttle connector rod (U) and choke connector rod (V) rotate fast idle cam (W) to slow idle position and fully close the throttle valves 3 While holding throttle valves fully closed place a scale against choke unloader arm of throttle lever and make an index mark on carbureter body at the 1/2 inch division of scale 4 With ignition switch turned on (or test lamp connected) hold end of scale against unloader arm (X) and slowly open throttle until the drive pinion just engages flywheel ring gear (or test lamp lights) 5 If switch is correctly timed the scale will then read between 1¼" and 1 9/16" at mark on carbureter body (Y) (¾" to 1 1/16" travel of arm) 6 If necessary make switch adjustment by reducing or increasing the total thickness of the brass shims If switch tim ng was found to be too early reduce the total thickness of the shims If timing was too late increase total thickness of shims Two sizes of shims are available 153 11 018" — 153 12 006" After adjustment is completed set engine idle at specified RPM

608SC-663S..	.025"	.015"	4° B.T.D.C.	.015" (1949 "50")	.015" None (1948)	5/32"	¾ to 1¼
609SC-664S...	.025"	.015"	6° B.T.D.C.	.015" (1949)	.015" None	5/32"	¾ to 1¼

NOTE: 1949 Models "50" and "70" are equipped with hydraulic valve lifters. No adjustment.

BRIEF CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENTS: Two separate float adjustments must be made—lateral and vertical. On 608S-608SA-609S-609SA use gauge T109-162 (3/16 inch). On 608SC-609SC-663S-664S use gauge T109-196 (5/32 inch).

Lateral Adjustment: With bowl cover gasket removed, bowl cover inverted and float lip resting on seated needle, place float gauge directly under float with notched portions of gauge fitted over edges of casting. Floats should barely touch the vertical uprights of float gauge. Adjustment should be made by bending arm of float.

Vertical Adjustment: With float gauge in position mentioned above, floats should just clear the horizontal portion of gauge. Adjust by bending arm of float. Carefully remove float, install bowl cover gasket and then reinstall float.

A fast check of the fuel level can be made on the car by removing the inspection hole plug in the side of the carbureter body. Fuel level should be even with the bottom of the hole with engine idling.

PUMP ADJUSTMENT: Correct pump plunger travel is important and should be checked each time the carbureter is disassembled. The total distance the plunger (not shaft) moves from closed to wide open throttle controls the amount of fuel discharged. Procedure is as follows: With pump connector link in place (outer hole-long stroke on 608SC-609SC-663S-664S) back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. Support carbureter so throttle can be opened without throttle lever dragging on bench top (wooden block will suffice). Place pump travel gauge T109-117S inverted on edge of dust cover boss of bowl cover. Turn knurled nut of gauge until finger just touches upper end of plunger shaft. Read figure indicated on gauge at notch of knurled nut. Open throttle slowly until plunger bottoms in pump cylinder (at approximately half throttle). This can be determined by the additional force necessary to continue to move throttle lever. Relocate pump travel gauge and turn knurled nut until finger again touches top of plunger shaft. Hold gauge vertical to insure correct pump stroke readings. Observe number indicated on gauge. The difference in the two readings obtained should be "21" (21/64" plunger travel). Adjust by bending throttle connector rod at angle.

PUMP JET ADJUSTMENT: Good acceleration performance at low speeds depends primarily on the gasoline dis-

CARBURETER
TRADE MARK REG. U. S. PAT. OFF
MARCA REGISTRADA

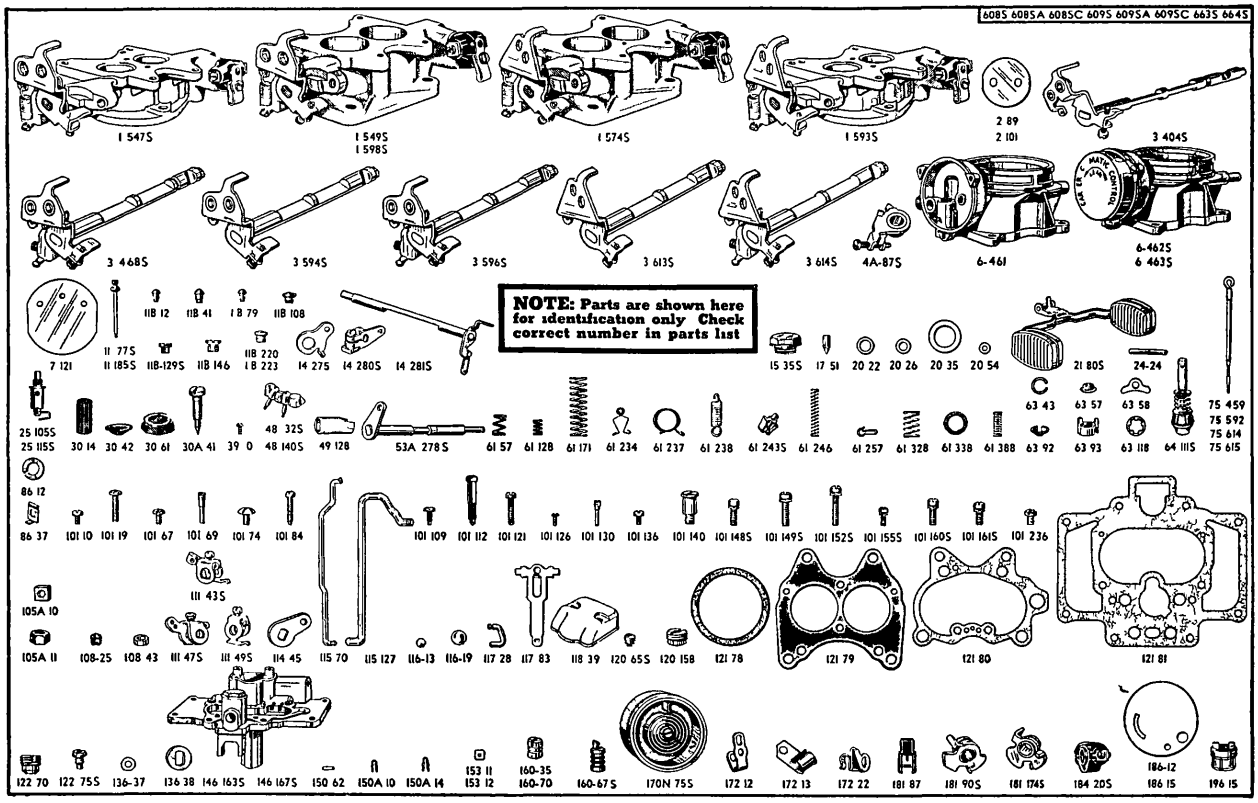
PRINTED IN U.S.A.

charged from the pump jets Each of the two streams must be directed to its proper section of the dual venturi system In order to obtain maximum efficiency, each stream should strike within 3/16' diameter circle, the center of which is 11/64" from the opposite wall of the bore and (609S-SA-SC-664S, ¼") (608S-SA-SC-663S, 9/64") inward from the primary venturi

Some carbureters have these targets marked, and on these it will not be necessary to measure Do not scratch venturi, a pencil mark will suffice Only a slight bend will be necessary to aim the pump jets properly

METERING ROD ADJUSTMENT Metering rod gauging is important and should be done each time the carbureter is disassembled It must be done after completing the pump adjustment Procedure is as follows (608S-SA-609S-SA) Back out throttle adjusting screw until throttle valves seat in bores of carbureter Insert one metering rod gauge in place of either metering rod Use gauge T109-152 for 608S-SA and T109-163 for 609S-SA Press down lightly on vacuum piston link until lug of piston link contacts lip of metering rod arm There should now be less than 005" clearance between metering rod bearing and shoulder in notch of metering rod gauge Adjust by bending lip of metering rod arm Use bending tool T109-105

(608SC-609SC-663S-664S) No metering rod gauges are necessary on these carbureters 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place, press down on vacuum link until metering rods bottom in carbureter body casting 3 Holding rods in downward position with throttle valves tightly closed revolve metering rod arm until finger on arm contacts vacuum link Then carefully tighten clamp screw



UNLOADER ADJUSTMENT Two adjustments are necessary

A Loosen choke lever clamp screw on choke shaft Insert 020" feeler gauge (T109-29) between lip of fast idle cam and boss on flange casting Hold choke valve tightly closed and take all slack out of linkage by pressing choke lever toward closed position Hold in place and tighten clamp screw

B Adjust unloader lip on throttle shaft lever until there is 3/16' clearance between upper edge of choke valve and inner wall of air horn with throttle held in wide open position (use gauge T109-28)

FAST IDLE ADJUSTMENT With choke valve tightly closed adjust fast idle adjusting screw to give the following clearance between throttle valve and bore of carbureter (side opposite idle port) 608S-SA, 012", 609S-SA, 018", 608SC-663S, 015", 609SC-664S, 018" Be sure fast idle adjusting screw is on high step of cam when making this adjustment

STARTER SWITCH ADJUSTMENT. Switch should make contact within 30° and 45° throttle opening from fully closed position Use gauge T109-155S to qualify switch Qualification of the switch must not require less than one 153-11 (.018" shim) nor more than three 153-11 and two 153-12 (.006"shims)

†**FLANGE ASSEMBLY**—The difference between 608S and 608SA and between 609S and 609SA is in the flange assembly The throttle centering screw 101 69 has been removed from flange 1-547S used on 608SA and centering screw 101-130 has been removed from flange 1 549S used on 609SA Throttle shaft and lever assemblies 3-594S (608SA) and 3 596S (609SA) must be used with these flanges as shaft is not grooved for throttle centering screw but has additional length to accommodate throttle shaft retaining ring 63-118

To assemble flanges with throttle centering screw install throttle shaft and lever assembly and centering screw, then install throttle valves with © toward idle port and toward the manifold Center valves tapping lightly and hold in place with fingers before tightening screws

To assemble flanges without centering screw install throttle shaft and turn to closed throttle position Push retaining ring with prongs extending outward, over end of throttle shaft until it is against casting (no end play in shaft) Throttle valves should then be installed centering them as mentioned above with throttle lever in closed position and throttle lever set screw backed out

‡These parts are packed with 663S and 664S carbureters Use part No 108-25 when replacing 440S or 448S

All Single Carbureter Installations

AFB Four Bore Down-Draft Climatic® Control Carbureters

Nos. 2814S-2815S

CARBURETER SPECIFICATIONS

For Cadillac 8 Cylinder 390 Cu. In. Engine

Dimensions: Flange, four-bore—4 bolt type

Throttle bore primary, 1-7/16 inch secondary 1 11/16 inch I D

Primary venturi size primary side 11/32 inch secondary side, 11/32 inch I D

Main venturi size primary side 1 3/16 inch secondary side, 1-9/16 inch I D

Vents: Inside (4) in air horn, Outside (4) in body

Low Speed Circuit: (Primary side only)
Jet size No 67 (.032 inch) drill
By-pass, size No 56 (.0465 inch) drill
Economizer, size No 56 (.0465 inch) drill
Idle bleed size No 55 (.052 inch) drill
Idle port, slot type length .180 inch, width .030 inch

Idle Port Opening: .123 to .129 inch above top edge of valve with valve tightly closed

Set Idle Adjustment Screw: 1¼ to 2¾ turns open For richer mixture turn screw out Do not idle engine below 450 R P M (Transmission in Drive Range) For cars with air conditioning set idle at 450 R P M with air condition on (Transmission in Drive Range)

Main Nozzle: Installed permanently DO NOT REMOVE Anti percolator bleed primary (tube in venturi assembly) size No 70 (.028 inch) drill Secondary (drilled hole in venturi assembly) size No 68 (.031 inch) drill

Main Vent Tube: (In venturi assembly) Side holes primary side 11—size No 70 (.028 inch) drill; secondary 3—size No 70 (.028 inch) drill Air bleed to vent tube secondary side size No 57 (.043 inch) drill Under STRUT bleed primary side only size No 42 (.0935 inch) drill

Secondary Initial Discharge: (In venturi assembly, secondary side only) Air bleed size No 55 (.052 inch) drill Discharge port size No 52 (.0635 inch) drill

Accelerating Pump: Discharge jet (twin) primary side only size No 70 (.028 inch) drill Intake ball check assembly installed from inside of bowl, .115 to .120 inch diameter Discharge needle seat size No 50 (.070 inch) drill

Choke: Carter Climatic® Control set on index Butterfly type —offset valve primary side only Choke heat suction hole bushing between body and piston housing size No 43 (.089 inch) drill

Vacuum Spark Port: Horizontal slot length .130 inch, width .040 inch Top of port to be .010 to .016 inch above upper edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .0125"-.0175" 28° to 32° Dwell	Ignition Timing Breaker Points to Open: 5° B. T. C. At Vibration Damper	Float Setting 5/16 Inch (Use Gauge T109-107) Idle Adjustment	Screw Setting 1¼ t 2¾ Turns Open Idle Engine at 450 R.P.M. In Drive Range

NOTE: These cars are equipped with Hydraulic Valve Lifters — NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3729

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 5/16 inch (gauge T109-107) plus or minus 1/64 inch between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch plus or minus 1/16 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 15/32 inch from the top of the bowl cover to the top of the plunger shaft, with throttle connector rod in inner hole (long stroke) of pump arm. To adjust, bend throttle connector rod.

CHOKE PISTON LEVER ADJUSTMENT: .040 inch (Gauge T109-193) between choke lever and stop in piston housing with choke valve closed. To adjust, bend choke connector rod. NOTE: Choke valve should be held closed by applying pressure to piston lever in piston housing.

FAST IDLE LINKAGE ADJUSTMENT: With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .023 inch (Gauge T109-189) between lower edge of valve and bore with adjusting screw on index mark of cam.

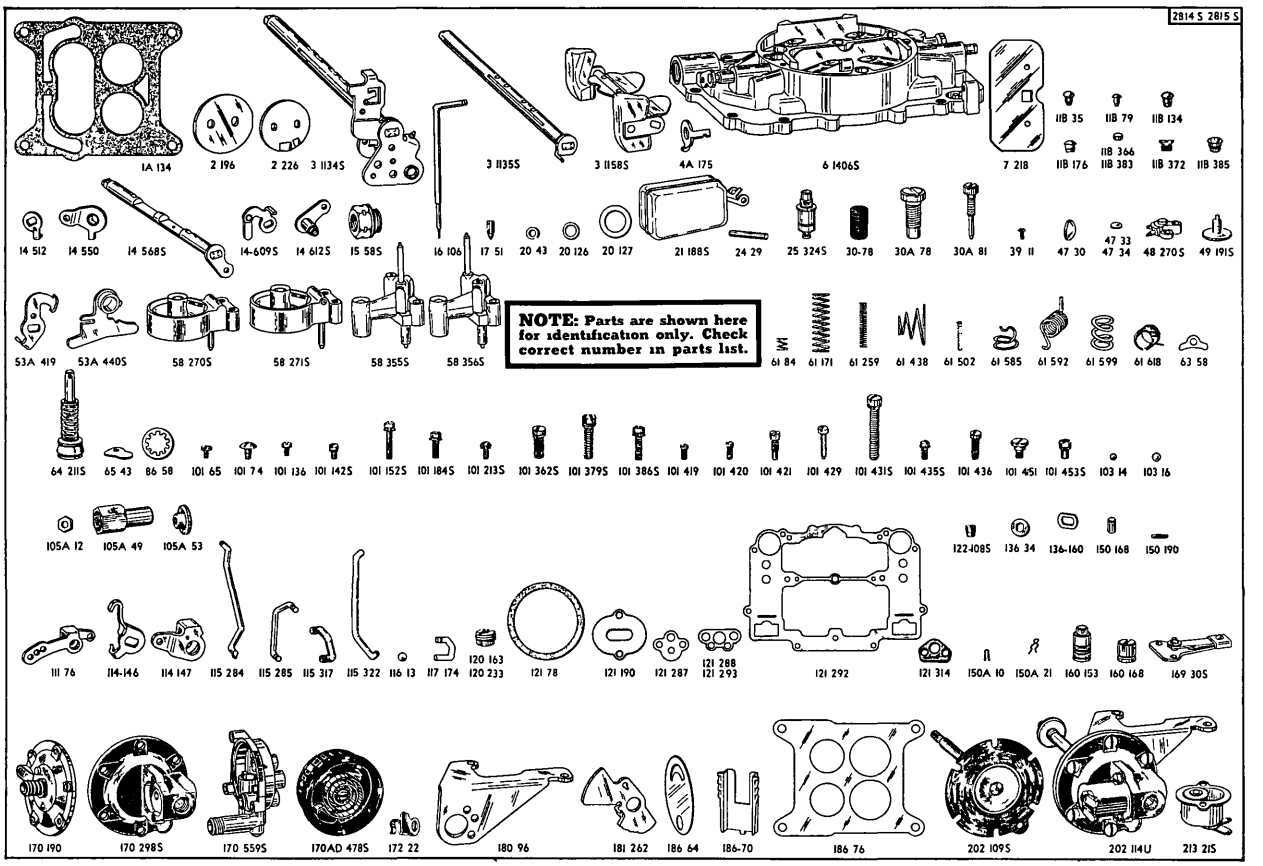
FAST IDLE ON CAR: 1700 to 1750 R.P.M. hot engine with fast idle screw on index mark of cam.

UNLOADER: 9/32 inch (Gauge T109-126) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 23/64 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: At wide open throttle secondary valves will be a few degrees from wide open. 3. With primary and secondary valves in tightly closed position there should be .010" to .030" (Gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: 1. Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever. 2. With lock-out dog held tight against stop on flange casting and secondary throttle valves partially open there should be .020 inch (Gauge T109-29) between tang on secondary throttle lever and lock-out arm. To adjust, bend arm at slot on lock-out dog. NOTE: Fast idle cam may be removed to facilitate gauging and adjusting.

IDLE SPEED AND MIXTURE ADJUSTMENT (Normal Engine Temp.): In making the idle adjustment on the engine, the air adjustment screw is used to adjust idle speed in a similar manner as the throttle speed screw used previously. Turning the air adjustment screw outward increases engine speeds, but also leans the mixture supplied to the manifold which must be compensated for by adjustment of the idle mixture adjusting screws.



AIR CONDITIONER FAST IDLE DEVICE ADJUSTMENT: This adjustment must be made after carbureter is installed on car, engine at normal operating temperature and slow idle adjustment is completed. With shift lever in neutral and air conditioner turned on, engine should idle 900 to 950 R.P.M. To adjust, loosen lock nut on diaphragm shaft and adjust knurled nut to obtain specified R.P.M. then tighten lock nut.

TOOLS REQUIRED FOR SERVICING CARBURETERS:

T109-29	.020"-.030" Wire gauge	T109-126	9/32" Unloader gauge
T109-41	Bending tool	T109-189	.023" Wire gauge
T109-107	5/16" Float gauge	T109-193	.040" Wire gauge

T109-213 Bending tool

CAUTION: Secondary venturi (two) must be installed in correct locations. Check part numbers on venturi against part numbers on parts list for locations.

Cadillac 8—1959—Carbureters Nos. 2814S-2815S

WHEN SERVICING, USE GASKET ASSORTMENT No. 315, RE-CARBURETION KIT No. 1977N

PART NAMES, IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF RE-CARBURETION KIT

Part No.	PART NAME	
1A-134	—FLANGE GASKET	
2-196	Secondary throttle valve	(2)
2-226	—Primary throttle valve	(2)

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3729

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 5/16 inch (Gauge T109-107) between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 15/32 inch from the top of the bowl cover to the top of the plunger shaft, with throttle connector rod in inner hole (long stroke) of pump arm. To adjust, bend throttle connector rod.

CHOKE PISTON LEVER ADJUSTMENT: .040 inch (Gauge T109-193) between choke lever and stop in piston housing with choke valve closed. To adjust, bend choke connector rod.

FAST IDLE LINKAGE ADJUSTMENT: With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .023 inch (Gauge T109-189) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 1750 R. P. M. hot engine with fast idle screw on index mark of cam.

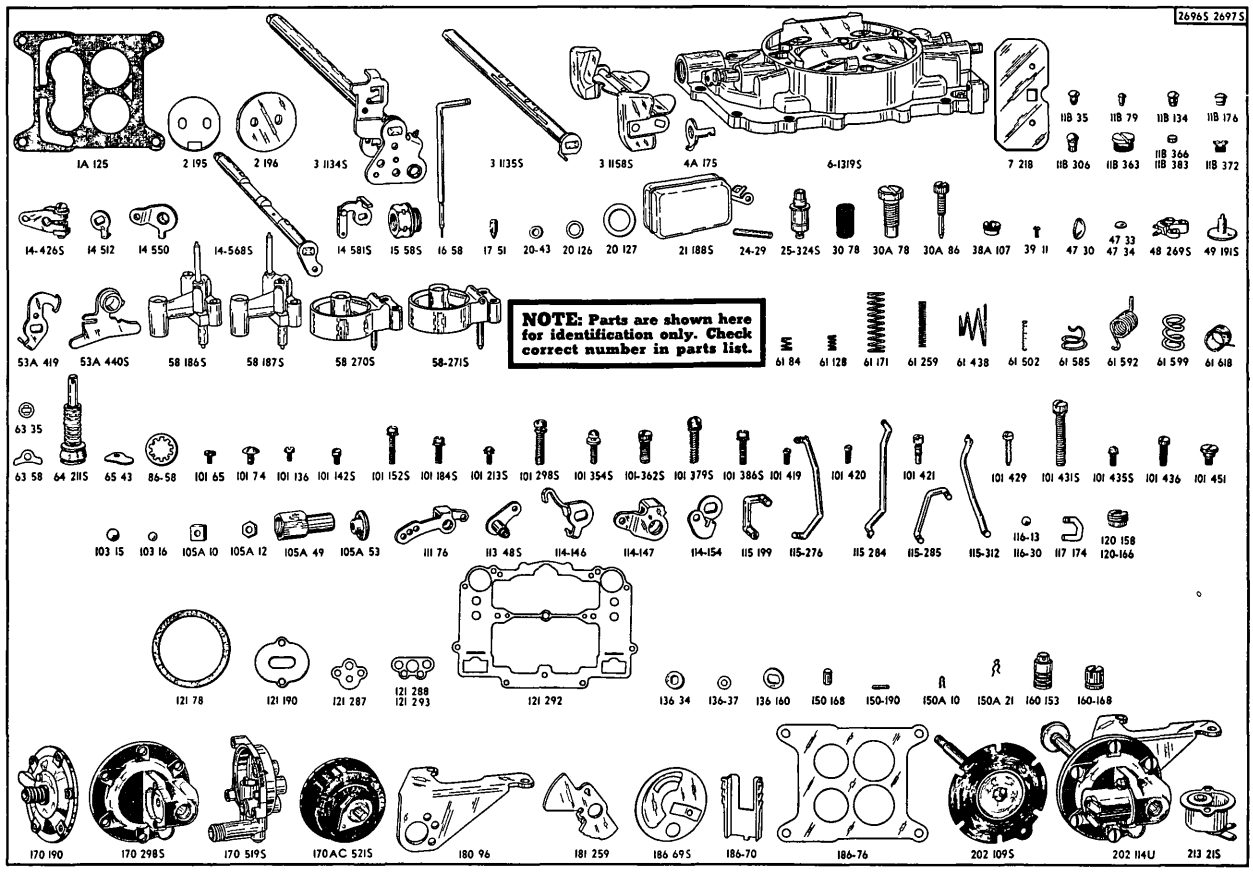
UNLOADER: 9/32 inch (Gauge T109-126) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 23/64 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: At wide open throttle secondary valves will be a few degrees from wide open. 3. With primary and secondary valves in tightly closed position there should be .010" to .030" (Gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: 1. Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever. 2. With lock-out dog held tight against stop on flange casting and secondary throttle valves partially open there should be .020 inch (Gauge T109-29) between tang on secondary throttle lever and lock-out arm. To adjust, bend arm at slot on lock-out dog. NOTE: Fast idle cam may be removed to facilitate gauging and adjusting.

CHOKE MODIFIER ADJUSTMENT: 1. Set Climatic® Control on index. 2. Loosen clamp screw. 3. Remove lower end of connector rod. 4. Rotate metal pointer until it is in line with raised pointer on coil housing. 5. Align scribed line on lever so that it is in a horizontal position. Hold in place and tighten clamp screw. 6. Seat throttle valves (hold choke valve wide open). 7. Hold pointer as indicated in No. 4. Lower end of rod must slide freely into hole in throttle arm. To adjust, bend rod at upper angle.

IDLE SPEED AND MIXTURE ADJUSTMENT (Normal Engine Temp.): In making the idle adjustment on the engine, the air adjustment screw is used to adjust idle speed in a similar manner as the throttle speed screw used previously. Turning the air adjustment screw outward increases engine speeds, but also leans the mixture supplied to the manifold which must be compensated for by adjustment of the idle mixture adjusting screws.



AIR CONDITIONER FAST IDLE DEVICE ADJUSTMENT: This adjustment must be made after carbureter is installed on car, engine at normal operating temperature and slow idle adjustment is completed. Procedure is as follows:

1. Shift lever in drive range.
2. Disconnect short wire from terminal at front of refrigeration compressor to stop compressor.
3. Turn air conditioner on and turn temperature control switch toward cooler position.
4. Loosen fast idle device lock nut on diaphragm shaft and adjust knurled nut to idle engine at 525 R. P. M., then tighten lock nut.
5. Connect short wire to terminal on compressor.

ST. LOUIS 7, MO., U.S.A.

GENERAL BULLETIN

BULLETIN NO. 8 Cadillac

ALL CARBURETER ACCOUNTS

DATE January 27, 1958

SUBJECT: 1957 and 1958 Cadillac AFB-2479S and 2696S (4 Bore) Carbureters

We have had requests for a listing of the additional material required to install an AFB-2479S carbureter on a 1957 Cadillac, or an AFB-2696S on a 1958 Cadillac not originally equipped with a Carter carbureter. The additional material is as follows:

1 Throttle lever adaptor, Carter part 4-856, list price $1.45.

1 Fuel line 5/16" tubing (1957 17" long) (1958 12" long).

1 Choke hot air line 1/4" tubing 28" long, one end cut at 45° angle. The original choke line insulating cover should be re-used.

1 Vacuum spark line 3/16" tubing 28" long.

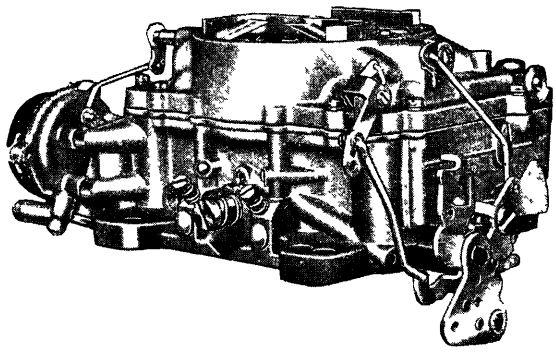
If equipped with air conditioning, one (1) Carter air conditioning fast idle control 202-114U.

It is very important that the 186-76 flange baffle plate (included with carbureter) be installed next to the carbureter to prevent exhaust gas damage to the casting.

On either a replacement or original equipment installation, the accelerator linkage should be checked for possible binding between the linkage and the fast idle cam or air conditioning fast idle control.

An initial shipment is being made to Central Distributors of a limited quantity of the 4-856 adaptor.

V. F. Thompson, Manager
Distribution Sales



RJM:dg

cc: Personnel and Extra Copies - U.S.A. and Canada

IMPORTANT: THIS BULLETIN CONTAINS INFORMATI N OF VALUE TO YOU AND WAS PREPARED AT CONSIDERABLE EXPENSE TO BE OF SERVICE TO YOU. FAILURE TO USE THIS INFORMATION MAY COST YOU MONEY. WE SUGGEST THAT YOU ISSUE COPIES OF IT TO THOSE F YOUR STAFF INTERESTED, S THAT THEY CAN BE FILED IN REGULAR CARTER SALES AND SERVICE MANUAL.

CARBURETER SPECIFICATIONS

For Cadillac 8 Cylinder 365 Cu. In. Engine

Dimensions: Flange, four-bore—4 bolt type
Throttle bore, primary, 1-7/16 inch; secondary 1-11/16 inch I. D.
Primary venturi size, primary side, 11/32 inch, secondary side, 11/32 inch I. D.
Main venturi size, primary side, 1-3/16 inch, secondary side, 1-9/16 inch I. D.

Vents: Inside (4) in air horn; Outside (4) in body

Gasoline Intake: Size No. 38 (.1015 inch) drill hole in needle seat.

Low Speed Jet Tube: (In venturi assembly, primary side only.)
Jet, size No. 67 (.032 inch) drill.
By-pass, size No. 55 (.052 inch) drill.
Economizer, size No. 56 (.0465 inch) drill.
Idle bleed, size No. 55 (.052 inch) drill.

Idle Port: (Upper slot type. Primary, length .144 inch; width .030 inch. Secondary, none.

Idle Port Opening: Primary .082 to .088 inch above top edge of valve with valve tightly closed. Secondary, none.

Set Idle Adjustment Screw: 3/4 to 2 1/4 turns open. For richer mixture turn screw out. Do not idle engine below 450 R. P. M (Transmission in Drive Range). For cars with air conditioning set idle at 450 R P. M. with air conditioning on (Transmission in Drive Range).

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolator bleed, primary, (tube in venturi assembly) size No. 70 (.028 inch) drill. Secondary, (drilled hole in venturi asembly) size No. 68 (.031 inch) drill.

Main Vent Tube: (In venturi assembly). Side holes primary side 11—Size No. 70 (.028 inch) drill; secondary 3—size No. 70 (.028 inch) drill. Air bleed to vent tube, secondary side, size No. 57 (.043 inch) drill.

Secondary Initial Discharge: (In venturi assembly, secondary side only.) Air bleed, size No. 73 (.024 inch) drill. Discharge port size No. 52 (.0635 inch) drill.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 72 (.025 inch drill. Intake ball check seat (screw plug), size .115 to .120 inch diameter. Discharge needle seat size No. 50 (.070 inch) drill.

Choke: Carter Climatic® Control set on index. Butterfly type—offset choke valve, primary side only. Choke heat suction hole, bushing between body and piston housing, size No. 45 (.082) inch drill.

Vacuum Spark Port: Half round port length. .180 inch, width .081 inch. Bottom of port .002 to .008 inch above lower edge of valve with valve tightly closed.

Motor Tune-Up — Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .0125"-.0175" 28° to 32° Dwell	Ignition Timing Breaker Points to Open: 5° B. T. C. (at "A" Mark) At Vibration Damper	Float Setting 5/16 Inch (Use Gauge T109-107)	Idle Adjustment Screw Setting 3/4 to 2 1/4 Turns Open Idle Engine at 450 R.P.M. In Drive Range

NOTE: These cars are equipped with Hydraulic Valve Lifters — NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3729

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 5/16 inch (gauge T109-107) between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 15/32 inch from the top of the bowl cover to the top of the plunger shaft, with throttle connector rod in inner hole (long stroke) of pump arm. To adjust, bend throttle connector rod.

CHOKE PISTON LEVER ADJUSTMENT: .040 inch (Gauge T109-193) between choke lever and stop in piston housing with choke valve closed. To adjust, bend choke connector rod.

FAST IDLE LINKAGE ADJUSTMENT: With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .023 inch (Gauge T109-189) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 1750 R.P.M. hot engine with fast idle screw on index mark of cam.

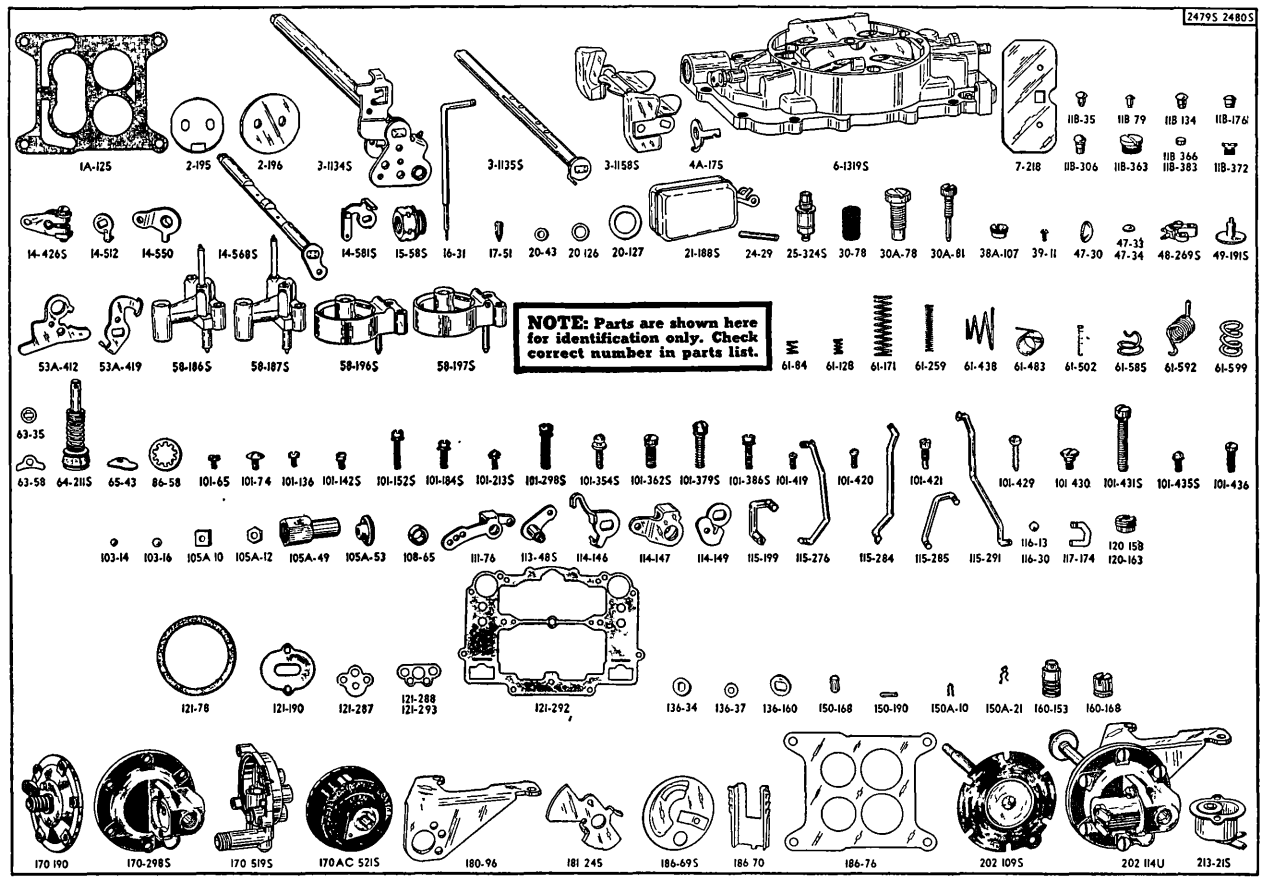
UNLOADER: 9/32 inch (Gauge T109-126) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 23/64 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: At wide open throttle secondary valves will be a few degrees from wide open. 3. With primary and secondary valves in tightly closed position there should be .017" to .022" (Gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT. 1. Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever. 2. With lock-out dog held tight against stop on flange casting and secondary throttle valves partially open there should be .020 inch (Gauge T109-29) between tang on secondary throttle lever and lock-out arm. To adjust, bend arm at slot on lock-out dog. NOTE: Fast idle cam may be removed to facilitate gauging and adjusting.

CHOKE MODIFIER ADJUSTMENT: 1. Set Climatic® Control on index. 2. Loosen clamp screw. 3. Remove lower end of connector rod. 4. Rotate metal pointer until it is in line with raised pointer on coil housing. 5. Align scribed line on lever so that it is in a horizontal position. Hold in place and tighten clamp screw. 6 Seat throttle valves (hold choke valve wide open). 7. Hold pointer as indicated in No. 4. Lower end of rod must slide freely into hole in throttle arm. To adjust, bend rod at upper angle.

IDLE SPEED AND MIXTURE ADJUSTMENT (Normal Engine Temp.): In making the idle adjustment on the engine, the air adjustment screw is used to adjust idle speed in a similar manner as the throttle speed screw used previously. Turning the air adjustment screw outward increases engine speeds, but also leans the mixture supplied to the manifold which must be compensated for by adjustment of the idle mixture adjusting screws.



AIR CONDITIONER FAST IDLE DEVICE ADJUSTMENT: This adjustment must be made after carbureter is installed on car, engine at normal operating temperature and slow idle adjustment is completed. With shift lever in neutral and air conditioner turned on engine should idle 900 R.P.M. To adjust, loosen lock nut on diaphragm shaft and adjust knurled nut to obtain specified R.P.M., then tighten lock nut.

TOOLS REQUIRED FOR SERVICING CARBURETERS:

T109-29	.020"-.030" Wire gauge	T109-126	9/32" Unloader gauge
T109-41	Bending tool	T109-189	.023" Wire gauge
T109-107	5/16" Float gauge	T109-193	.040" Wire gauge

T109-213 Bending tool

CAUTION: Secondary venturi (two) must be installed in correct locations. Check part numbers on venturi against part numbers on parts list for locations.

Cadillac—1957—Carbureters Nos. 2479S-2480S

WHEN SERVICING, USE GASKET ASSORTMENT No. 315; RE-CARBURETION KIT No. 1902N

PART NAMES IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF RE-CARBURETION KIT

Part No.	PART NAME	
1A-125	—FLANGE GASKET	
2-195	—Primary throttle valve	(2)
2-196	Secondary throttle valve	(2)
3-1134S	—Primary throttle shaft and lever assembly	
3-1135S	—Secondary throttle shaft and dog assembly	
3-1158S	—Auxiliary throttle shaft, valve and weight assembly	
4A-175	Primary throttle shaft dog	
6-1319S	—Air horn assembly	
7-218	Choke valve	
11B-35	Rivet plug	
11B-79	Rivet plug	(2)
11B-134	Rivet plug (2480S)	
11B-176	Idle port rivet plug	(2)
11B-306	Fuel inlet plug	
11B-363	Pump intake screw plug	
11B-366	Lead plug	(2)
11B-372	Level sight plug	(2)
11B-383	—Lead plug	(2)
14-426S	Coil shaft lever and screw assembly	
14-512	Outside choke shaft lever	
14-550	Inside choke shaft lever	
14-568S	—Choke lever and shaft assembly	
14-581S	Choke piston lever, link and pin assembly	
15-58S	Fuel inlet fitting assembly	
16-31	—STEP-UP ROD .07225" x .066" x .046"	(2)
17-51	Pump discharge check needle	
20-43	Piston housing gasket	
20-126	Needle seat gasket	(2)
20-127	Fuel inlet fitting gasket	
21-188S	—Float and lever assembly	(2)
24-29	Float lever pin	(2)
25-324S	NEEDLE AND SEAT ASSEMBLY	(2)
30-78	Fuel inlet strainer	
30A-78	—Idle air adjustment screw	
30A-81	—Idle adjustment screw	(2)
38A-107	Pump intake check ball seat	
39-11	Choke valve attaching screw	(2)
47-30	Piston housing welsh plug	
47-33	Venturi welsh plug	(4)
47-34	Spark port welsh plug	
48-269S	—Pump jet and housing assembly	
49-191S	Electro magnet plunger assembly (2480S)	
53A-412	Lockout dog (Sup. by 53A-440S)	
53A-419	—Secondary throttle operating lever	
53A-440S	—Lockout arm and collar assembly	
58-186S	—Primary venturi assembly (choke side)	
58-187S	—Primary venturi assembly (pump side)	
58-196S	—Secondary venturi assembly (choke side)	
58-197S	—Secondary venturi assembly (pump side)	
61-84	*Idle, fast idle and air conditioning unit adjusting screw spring (2479S (3), (2480S (4)	
61-128	Throttle connector rod spring	(2)
61-171	Pump spring (lower)	
61-259	VACUUM PISTON SPRING	(2)
61-438	Diaphragm return spring (2480S)	
61-483	Secondary throttle return spring	

Part No.	PART NAME	
61-502	Electro magnet plunger spring (2480S)	
61-585	Step-up rod retaining spring	(2)
61-592	Throttle flex spring	
61-599	—Idle air adjustment screw spring	
63-35	Throttle connector rod retainer	(2)
63-58	Coil housing retainer	(3)
64-211S	—PUMP PLUNGER, ROD AND SPRING ASSEMBLY	
65-43	Step-up piston cover plate	(2)
86-58	Air conditioning unit lock washer (2480S)	
101-65	Choke shaft lever attaching screw	(2)
101-74	Throttle shaft lever attaching screw	(2)
101-136	Coil housing attaching screw	(3)
101-142S	Electro magnet housing attaching screw and washer assembly (2480S)	(2)
101-152S	Air horn attaching screw and washer assembly	
101-184S	Pump jet housing attaching screw and washer assembly	(2)
101-213S	Diaphragm cover attaching screw and washer assembly (2480S)	(6)
101-298S	Primary venturi attaching screw and washer assembly	(4)
101-354S	Coil shaft clamp screw and washer assembly	
101-362S	Air horn attaching screw and washer assembly (2479S (8), (2480S (6)	
101-379S	Secondary venturi attaching screw and washer assembly	(4)
101-386S	Air horn attaching screw and washer assembly (2480S)	(2)
101-419	Secondary throttle valve attaching screw	(4)
101-420	Primary throttle valve attaching screw	(4)
101-421	Pump arm attaching screw	
101-429	Fast idle adjustment screw	
101-430	—Fast idle cam attaching screw	
101-431S	Air horn attaching screw and washer assembly	
101-435S	Step-up piston cover plate attaching screw and washer assembly	(2)
101-436	Piston housing attaching screw	(3)
103-14	Lead shot (early prod.)	
103-15	Lead shot (late prod.)	
103-16	Lead shot	
105A-10	Choke lever clamp screw nut	
105A-12	Air conditioning diaphragm unit lock nut (2480S)	
105A-49	Air conditioning unit to bracket attaching nut (2480S)	
105A-53	Air conditioning unit adjusting nut (2480S)	
108-65	Fast idle cam spacer (Sup. by 53A-440S)	

Part No.	PART NAME	
111-76	Pump arm	
113-48S	—Choke shaft and lever assembly (piston housing)	
114-146	—Primary throttle shaft arm (center)	
114-147	—Primary throttle shaft arm (inner)	
114-149	—Primary throttle shaft arm (outer)	
115-199	Throttle operating rod	
115-276	Throttle connector rod	
115-234	—Fast idle connector rod	
115-285	—Choke connector rod	
115-291	—Choke connector rod (Climatic® Control side)	
116-13	Air conditioning unit check ball (2480S)	
116-30	Pump intake check ball	
117-174	Pump connector link	
120-158	Secondary metering jet (.082")	(2)
120-163	PRIMARY METERING JET (.098")	(2)
121-78	COIL HOUSING GASKET	
121-190	Electro magnet housing gasket (2480S)	
121-287	PUMP JET HOUSING GASKET	
121-288	PRIMARY VENTURI CLUSTER GASKET	(2)
121-292	AIR HORN GASKET	
121-293	SECONDARY VENTURI CLUSTER GASKET	(2)
136-34	Choke piston lever retaining washer	(2)
136-37	Throttle operating rod washer	(5)
136-160	Secondary throttle shaft washer	
150-168	Air conditioning unit diaphragm air bleed pin (2480S)	
150-190	Choke piston pin	
150A-10	Pin spring	(6)
150A-21	Pin spring	
160-153	Step-up piston	(2)
160-168	Choke piston	
170-190	Inner diaphragm housing (2480S)	
170-298S	Outer diaphragm housing and plug assembly (2480S)	
170-519S	—Piston housing and plug assembly	
170AC-521S	—Thermostatic coil and housing assembly	
180-96	—Air conditioning unit bracket (2480S)	
181-245	—Fast idle cam	
186-69S	—Choke baffle plate assembly	
186-70	Fuel bowl baffle	(2)
186-76	—FLANGE BAFFLE PLATE	
202-109S	—Air conditioning unit diaphragm and shaft assembly (2480S)	
202-114U	—Unitized package (Consists of 2—101-386S and 1—202-110S (2480S)	
213-21S	Electro magnet and housing assembly (2480S)	

—Parts so marked are new and listed for the first time.

*Early prod. 2480S used (4), late prod. uses (3)

NOTE: Figures in parentheses indicate number of pieces used in one carbureter. Where no figure is shown, only one is used.

CARTER CARBURETOR
DIVISION OF ACF INDUSTRIES INCORPORATED
ST. LOUIS, MO., U. S. A.

CARTER MODEL AFB CARBURETER FOR CADILLAC
(SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the base of the carbureter, when requesting specification pages.

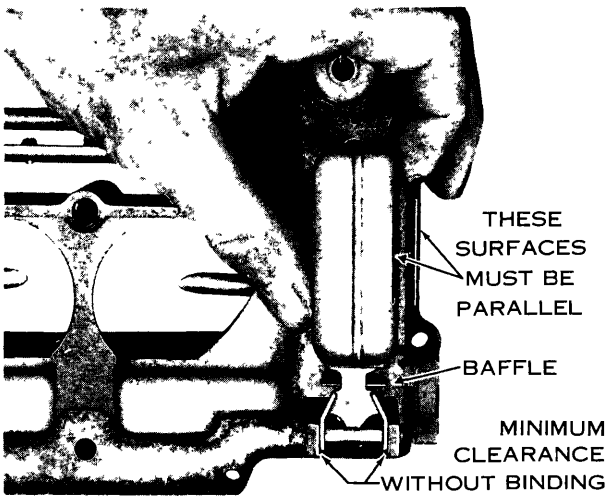


Figure 1

FLOAT ALIGNMENT ADJUSTMENT (Fig. 1):

1. Sight down the side of the float shell to determine if the side of the float is parallel to the outer edge of the air horn casting. TO ADJUST: Bend float lever by applying pressure to the end of the float shell with the fingers while supporting the float lever with thumb.

   CAUTION: To avoid damaging the float, apply only enough pressure to bend float lever.

2. After aligning float, remove as much clearance as possible between arms of float lever and lugs on air horn by bending the float lever. Arms of float lever should be as parallel to the inner surface of lugs on air horn as possible.

   Float must operate freely without excess clearance on its hinge pin.

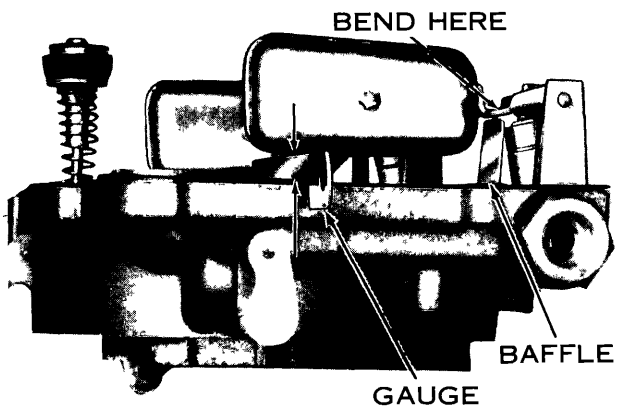

Figure 2

FLOAT LEVEL ADJUSTMENT (Fig. 2):

With air h rn inv rted, bowl cover gasket in place and needle seat d, the clearance between top of float (at outer end) and air horn gask t should be as listed on carbureter sp cification pag . To adjust, bend float arm. Adjust both fl ats. R ch ck float alignm nt.

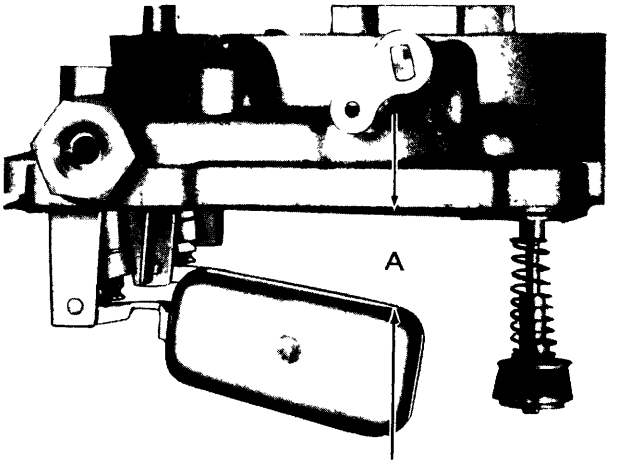

Figure 3

FLOAT DROP ADJUSTMENT (Fig. 3)

With bowl cover held in upright position and measuring from outer end of each float, the distance b tw n top of floats and bowl cover gasket should be as listed on carbureter specification page. To adjust, bend stop tabs on float brackets.

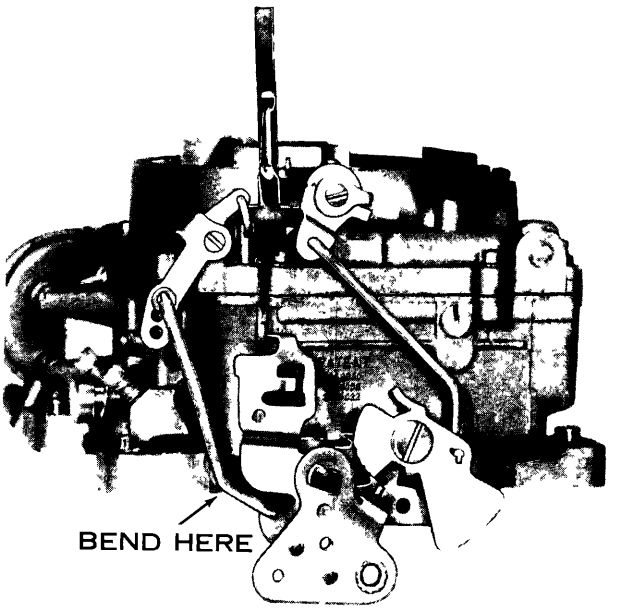

Figure 4

PUMP ADJUSTMENT (Fig. 4):

1. Seat throttle valves in bores of carbur ter. NOTE: Be sure choke is wide open so fast idle cam does not hold throttle valve open.
2. The distance from the top of the b wl cover to the t p of the plunger shaft should b as list d on carbur ter sp cification pag .
3. Adjust by bending thr ttl conn ctor r d at low r angle (use tool T109-213).

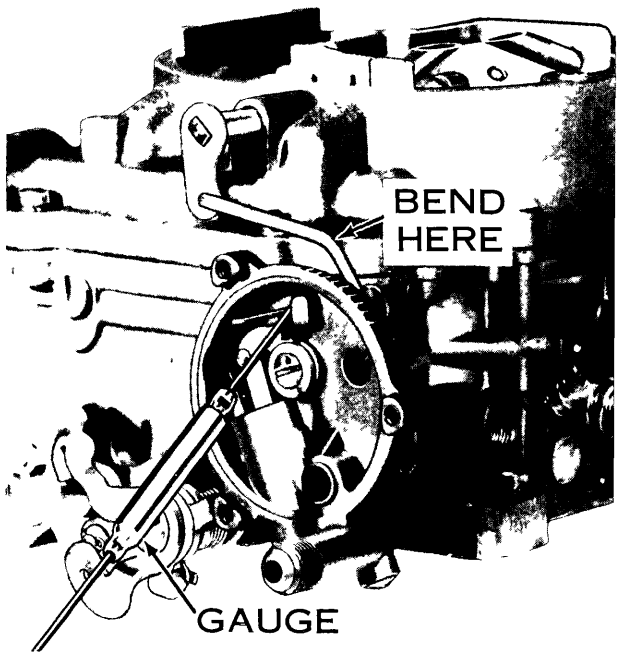

Figure 5

CHOKE PISTON LEVER ADJUSTMENT (Fig. 5):

With choke valve tightly closed, the clearance between choke lever and stop in piston housing should be as listed on carbur t r specification page. To adjust, bend choke connector rod (use tool T109-213).

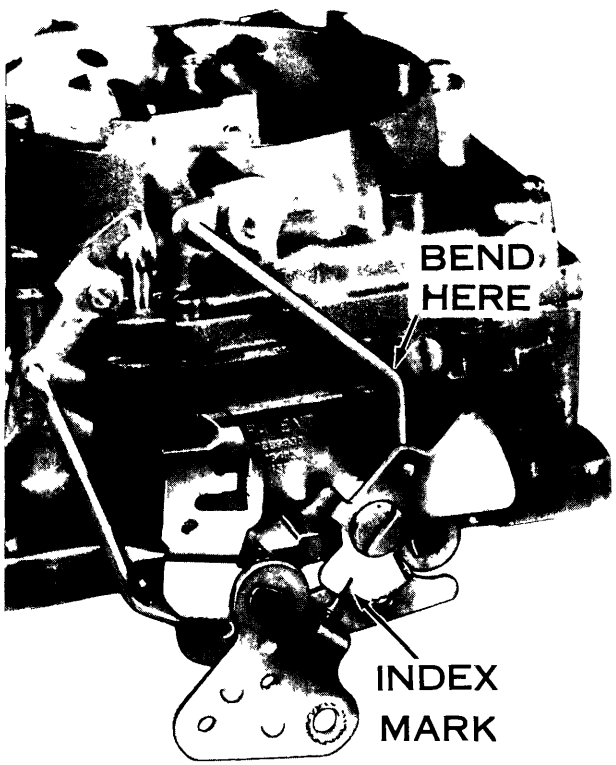

Figure 6

FAST IDLE LINKAGE ADJUSTMENT (Fig. 6):

With choke valve tightly clos d and lug on outer choke shaft l ver contacting stop on inn r chok shaft l v r align center of fast idle screw with index mark on cam. To adjust, bend fast idle conn ct r rod (use tool T109-213).

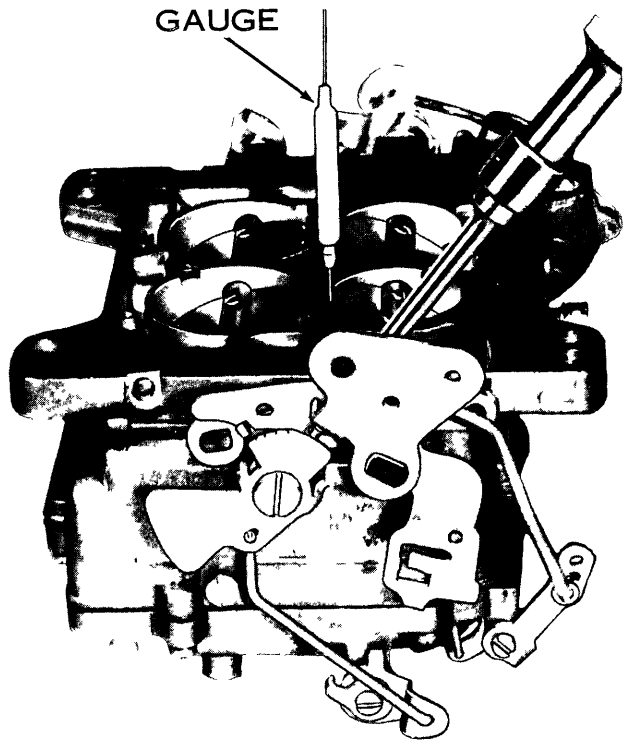

Figure 7

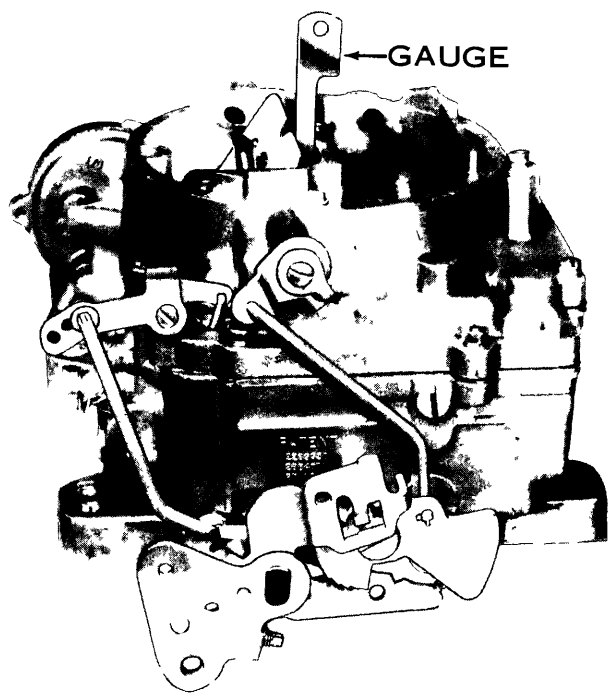
FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 7):

With choke valve tightly closed, tighten fast idle adjusting screw (on index mark of cam) until the clearance between throttle valve and bore of carbureter, side opposite idle port, is as listed on carbureter specification page.



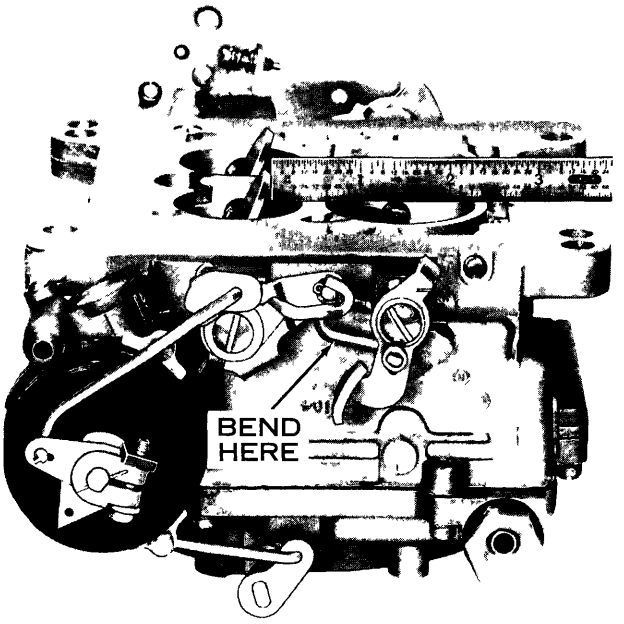


Figure 8

UNLOADER ADJUSTMENT (Fig. 8):

With thr ttle wide open, the clearance between upp r edge of choke valv and inner wall of air horn should be as listed on carbureter specification page. To adjust, bend unloader lip on throttle shaft lev r. (Use tool T109-41).

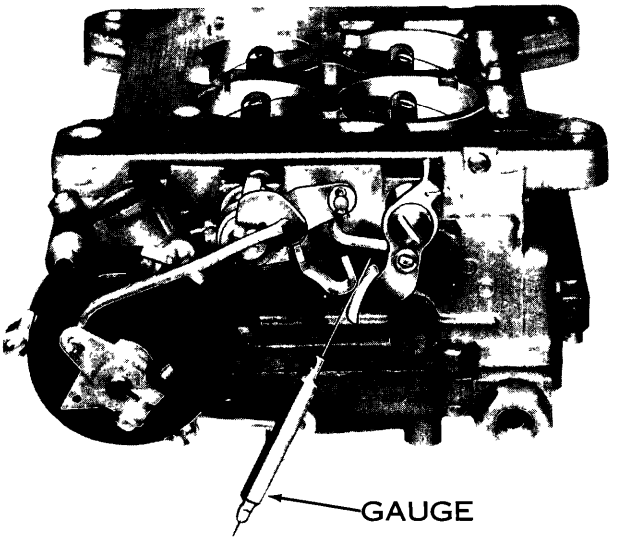

Figure 9

SECONDARY THROTTLE LEVER ADJUSTMENT (Fig. 9):

1. Block choke valve wide open.
2. Secondary throttle valves should just start to open when primary throttle valves are opened to the clearance as listed on specification page between lower edge of valve and bore (opposite idle port). To adjust, bend throttle operating rod. (Use bending tool T109-213). NOTE: Secondary throttle valves will be a few degrees from wide open position, when primary valves are wide open.
3. With primary and secondary throttle valves in tightly closed position, there should b the clearance as listed on specification page between positive closing shoes on primary and secondary throttle levers. To adjust, bend sho on secondary lever.

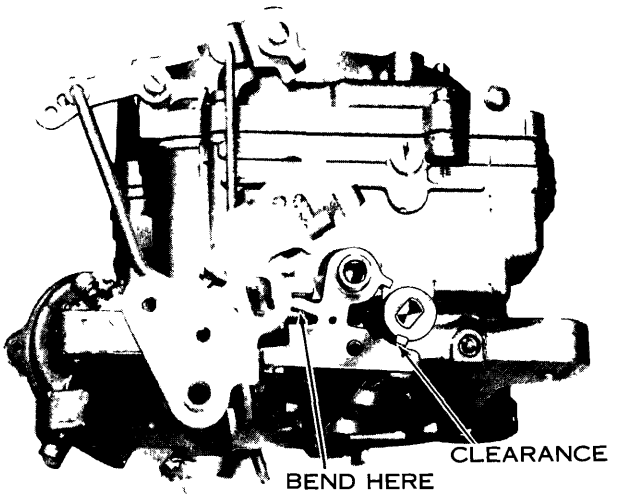

Figure 10

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 10):

1. Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.
2. With lock-out dog held tight against stop on flange casting and secondary throttle valves partially open the clearance between tang on secondary throttle lever and lock-out arm should be as listed n carbureter specification page. To adjust, bend arm at slot on lock-out dog. NOTE: Fast idle cam may b removed to facilitate gauging and adjusting.

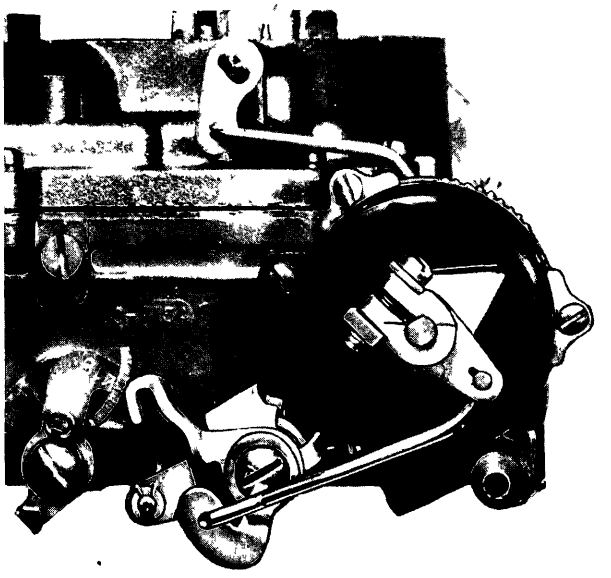

Figure 11

CHOKE MODIFIER ADJUSTMENT (Fig. 11):

1. Set Climatic (R) Control as listed on carbureter specification page. 2. Loosen clamp screw. 3. R move lower end of connector rod. 4. Rotate metal pointer until it is in line with raised pointer on coil housing. 5. Align scribed line on lever so that it is in a horizontal position. Hold in place and tighten clamp screw. 6. Seat throttle valves (hold ch ke valve wide open). 7. Hold pointer as indicated in No. 4. Lower end of rod must slid freely into hol in throttl arm. To adjust, bend rod at upp r angle.

Figure 12

(Fig. 12):

Pump intake check ball, seat and screw plug are removed by inverting carbureter and removing from lower side of flange.

(Fig. 13):

Check to be sure that auxiliary throttle shaft weights move freely and are free from dirt and gum. (Fig. 13).

Flooding, stumble on acceleration and other performance complaints are, in many instances, caused by the presence of dirt, water or other foreign matt r in the carbureter. To aid in diagnosing the cause of the c mplaint, the carbureter should be carefully removed from the engine without draining the fuel from the bowl. The contents of the fuel bowl may then be examined for contamination as the carbureter is disassembled.

Check th fu l in the bowl for contaminati n by dirt, water, gum or other for ign matter. A magnet mov d through the fuel in the bowl will pick up and identify any iron oxid dust that may have caused intake needle and seat leakage.

Insp ct gasketed surfaces between body and air horn. Small nicks or burrs should be smoothed down to eliminate air or fuel leakage. Be esp cially particular when inspecting the top surface of the inner wall of the bowl around the vacuum piston passage. A poor seal at this location may contribute to a "cutting-out" on turns complaint.

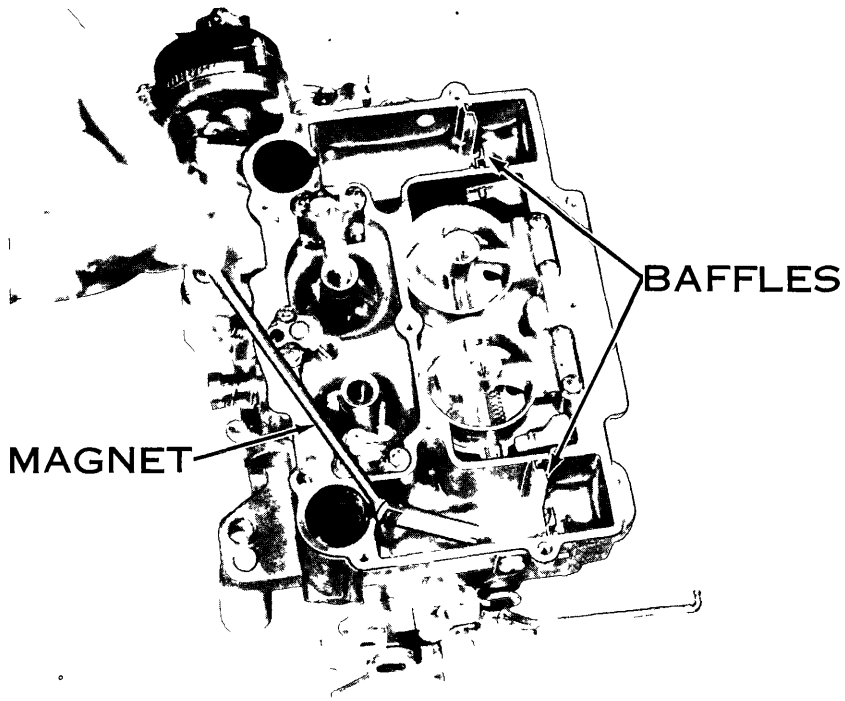

Figure 13

Install fu l baffles as shown (Fig. 13) to prevent damage to floats.

Fill th carbureter bowl with clean fuel before installing on the manifold. This will help prevent dirt trapped in the fuel syst m from b ing disoldged by the free flow of fuel as the carbureter is primed. The operation of the fl ats and intake needle and seats may be checked under pressure if a fuel pump is used at the bench to fill the carbureter bowl. Operate th throttle several times and visually check the discharge from the pump j ts.

B f re installing the carbureter, hold choke valve open and turn the idle speed screw until it just contacts th throttle lev r, then 1/2 a turn m re to open the throttl valves enough to keep th ngine running until the idle mixtur and final R.P.M. adjustment can be made.

5 S PRINTED IN USA

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical.

LATERAL ADJUSTMENT: With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portions of gauge fitted over edges of casting. Sides of floats should just clear the vertical upright of float gauge. Adjustment should be made by bending arms of floats.

VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge. The vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109-232) for primary floats and 1/4 inch (gauge T109-223) for secondary floats. Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be 5/8 inch for primary floats and 3/4 inch for secondary floats. Adjust by bending stop tabs on float bracket.

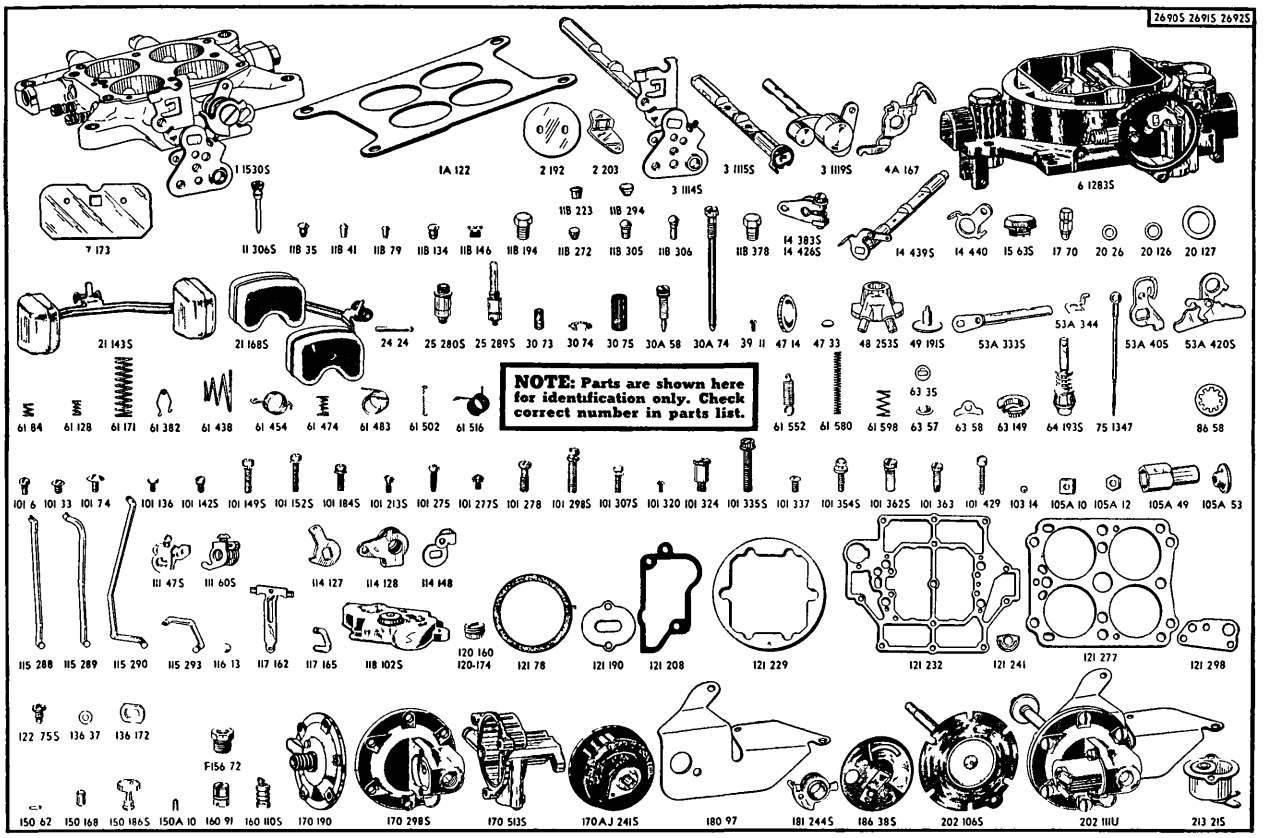
PUMP ADJUSTMENT: Install pump connector link in inner hole (short stroke) of pump arm, with ends extending toward countershaft arm. Seat throttle valves in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Seat throttle valves in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover gasket and dust cover. Seat throttle valves in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

CHOKE MODIFIER ADJUSTMENT: 1. Set Climatic® Control Assembly on index. 2. Loosen clamp screw. 3. Remove lower end of connector rod. 4. Rotate metal pointer until it is in line with raised pointer on coil housing. 5. Align scribed line on lever so that it is straight up and down. Hold in place and tighten clamp screw. 6. Seat throttle valves (hold choke valve wide open). 7. Hold pointer as indicated in No. 4. Lower end of rod must slide freely into hole in throttle arm. Bend rod at upper angle to adjust.

FAST IDLE AND SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: 1. Preliminary Adjustment: Loosen choke lever clamp screw on choke shaft. Lip of fast idle cam should lightly contact boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw. 2. Secondary Throttle Lock-Out Adjustment: (a) With choke valve tightly closed, tighten fast idle adjusting screw until there is .010 inch (gauge T109-200) opening between primary throttle valve and bore of carbureter (side opposite idle port). Lock pawl should now be in unlocked position; if not, adjust by bending tang on lock pawl (use bending tool T109-105). (b) Hold primary throttle valves half way open. Open choke valve fully, then open primary throttle valves all the way. Tang on secondary throttle arm should engage in notch on lock-out lever preventing secondary throttle shaft movement. Keep choke valve in wide open position. Close primary throttle valves so that lock pawl is unlocked, then open primary throttle valves all the way. Lock-out lever should fall free allowing secondary throttle valves to be open before primary throttle valves are fully open. If necessary, bend tang on secondary throttle lever to provide clearance for proper operation of lock-out lever.



FAST IDLE ON CAR: 1750 R. P. M. hot engine, in neutral, with fast idle screw on high step of cam.

UNLOADER ADJUSTMENT: With throttle wide open there should be 13/64 inch (gauge T109-39) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LEVER ADJUSTMENT: Primary and secondary throttle valves should reach wide open position at the same time. To adjust, bend throttle operating rod at upper angle (use bending tool T109-213). With primary and secondary throttle valves in tightly closed position there should be .017-.022 inch (gauge T109-29) clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

IDLE SPEED AND MIXTURE ADJUSTMENT (Normal Engine Temp.): In making the idle adjustment on the engine, the air adjustment screw is used to adjust idle speed in a similar manner as the throttle speed screw used previously. Turning the air adjustment screw outward increases engine speeds, but also leans the mixture supplied to the manifold which must be compensated for by adjustment of the idle mixture adjusting screws.

AIR CONDITIONER FAST IDLE DEVICE ADJUSTMENT: This adjustment must be made after carbureter is installed on car, engine at normal operating temperature and slow idle adjustment is completed. With shift lever in neutral and air conditioner turned on, engine should idle 900 R.P.M. To adjust, loosen lock nut on diaphragm shaft and adjust knurled nut tc obtain specified R.P.M., then tighten lock nut.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vertical

LATERAL ADJUSTMENT With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portions of gauge fitted over edges of cast ng Sides of floats should just clear the vertical upright of float gauge Adjust ment should be made by bending arms of floats

VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge The vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109 232) for primary floats and 1/4 inch (gauge T109 223) for secondary floats Adjust by bending float arms

FLOAT DROP ADJUSTMENT With bowl cover held in upright position and measuring from center of float the distance be tween top of floats and bowl cover should be 5/8 inch for pri mary floats and 3/4 inch for secondary floats Adjust by bend ing stop tabs on float bracket

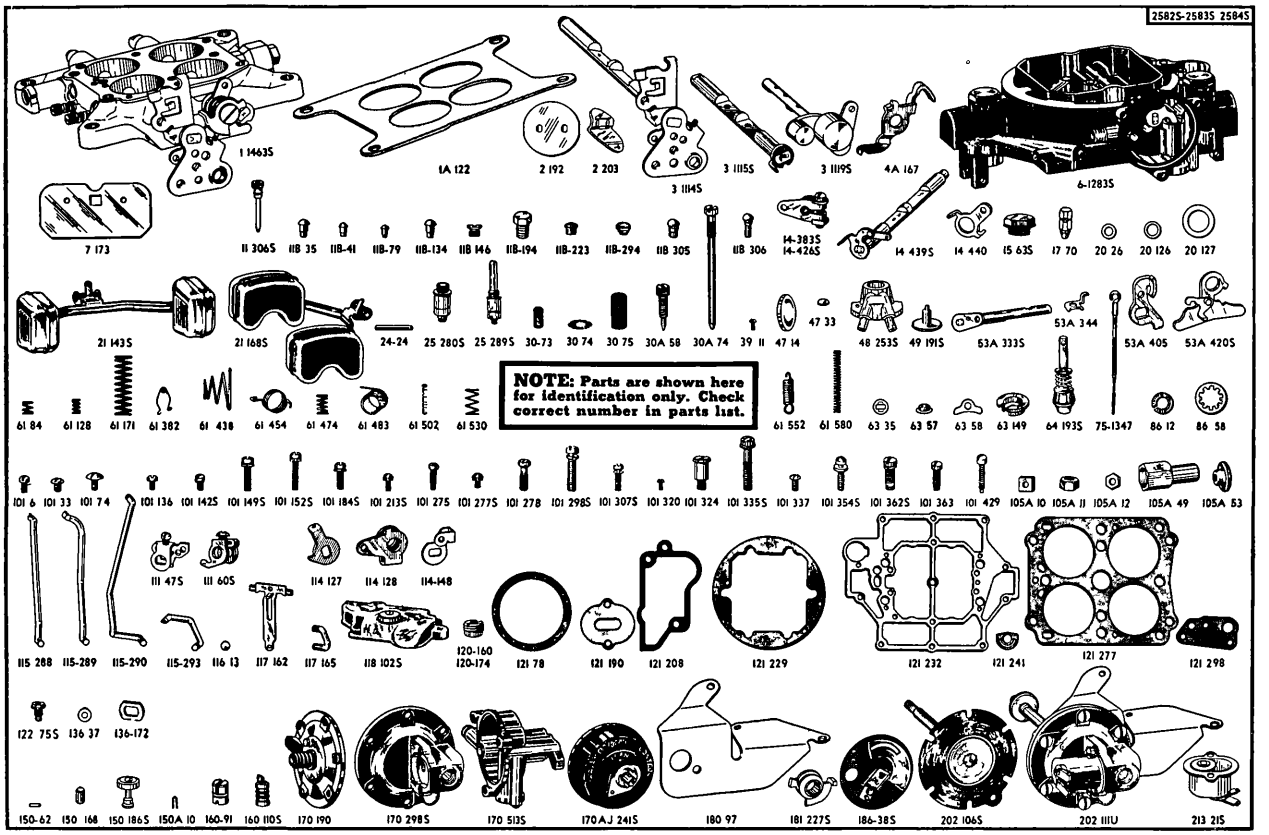
PUMP ADJUSTMENT Install pump connector link in inner hole (short stroke) of pump arm with ends extending toward coun tershaft arm Seat throttle valves in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109 213)

METERING ROD ADJUSTMENT Metering rod adjustment is important and must be made after completing the pump adjust ment No metering rod gauges are necessary Procedure is as follows 1 Seat throttle valves in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacumeter link until metering rods bot tom in carbureter body casting 3 Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

BOWL VAPOR VENT ADJUSTMENT This adjustment should be made after completing pump and metering rod adjustments Install dust cover gasket and dust cover Seat throttle valves in bores of carbureter There should be 1/16 inch (gauge T109 197) between lower edge of bowl vapor vent valve and dust cover To adjust remove dust cover and bend vapor vent arm

CHOKE MODIFIER ADJUSTMENT 1 Set Climatic® Control Assembly on index 2 Loosen clamp screw 3 Remove lower end of connector rod 4 Rotate metal pointer until it is in line with raised pointer on coil housing 5 Align scribed line on lever so that it is straight up and down Hold in place and tighten clamp screw 6 Seat throttle valves (hold choke valve wide open) 7 Hold pointer as indicated in No 4 Lower end of rod must slide freely into hole in throttle arm Bend rod at upper angle to adjust

FAST IDLE AND SECONDARY THROTTLE LOCK-OUT AD-JUSTMENT 1 Preliminary Adjustment Loosen choke lever clamp screw on choke shaft Lip of fast idle cam should lightly contact boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw 2 Sec ondary Throttle Lock Out Adjustment (a) With choke valve tightly closed tighten fast idle adjusting screw until there is 010 inch (gauge T109 200) opening between primary throttle valve and bore of carbureter (side opposite idle port) Lock pawl should now be in unlocked position if not adjust by bend ing tang on lock pawl (use bending tool T109 105) (b) Hold primary throttle valves half way open Open choke valve fully then open primary throttle valves all the way Tang on sec ondary throttle arm should engage in notch on lock out lever preventing secondary throttle shaft movement Keep choke valve in wide open position Close primary throttle valves so that lock pawl is unlocked then open primary throttle valves all the way Lock out lever should fall free allowing secondary throttle valves to be open before primary throttle valves are fully open If necessary bend tang on secondary throttle lever to provide clearance for proper operation of lock out lever



FAST IDLE ON CAR 1700 R P M hot engine in neutral with fast idle screw on high step of cam

UNLOADER ADJUSTMENT With throttle wide open there should be 13/64 inch (gauge T109 39) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109 41)

SECONDARY THROTTLE LEVER ADJUSTMENT Primary and secondary throttle valves should reach wide open position at the same time To adjust bend throttle operating rod at upper angle (use bending tool T109 213) With primary and sec ondary throttle valves in tightly closed position there should be 017 022 inch (gauge T109 29) clearance between positive clos ing shoes on primary and secondary throttle levers To adjust bend shoe on primary lever

IDLE SPEED AND MIXTURE ADJUSTMENT (Normal Engine Temp) In making the idle adjustment on the engine the air adjustment screw is used to adjust idle speed in a similar man ner as the throttle speed screw used previously Turning the air adjustment screw outward increases engine speeds but also leans the mixture supplied to the manifold which must be com pensated for by adjustment of the idle mixture adjusting screws

AIR CONDITIONER FAST IDLE DEVICE ADJUSTMENT This adjustment must be made after carbureter is installed on car engine at normal operating temperature and slow idle adjust ment is completed With shift lever in neutral and air condi tioner turned on engine should idle 900 R P M To adjust loosen lock nut on diaphragm shaft and adjust knurled nut tc obtain specified R P M then tighten lock nut

Cadillac "V-8"—1957—Carbureters Nos. 2582S-2583S-2584S

WHEN SERVICING, USE GASKET ASSORTMENT No. 295; REPAIR PACKAGE No. 1855
PART NAMES IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No.	PART NAME	
1-1463S	—Body flange assembly	
1A-122	—FLANGE GASKET	
2-192	—Primary and secondary throttle valve	(4)
2-203	—Auxiliary throttle valve	
3-1114S	—Primary throttle shaft and lever assembly	
3-1115S	—Secondary throttle shaft and dog assembly	
3-1119S	—Auxiliary throttle shaft lever and weight assembly	
4A-167	Throttle shaft dog	
6-1283S	—Air horn assembly	
7-173	Choke valve	
11-306S	—LOW SPEED JET ASSEMBLY	(2)
11B-35	Rivet plug	(4)
11B-41	Rivet plug	(2)
11B-79	Rivet plug	(4)
11B-134	Rivet plug (2582S 2583S (1) (2584S (2)	
11B-146	Level sight plug	(2)
11B-194	Pipe plug (2582S (2), (2583S 2584S (1)	
11B-223	Nozzle passage rivet plug	(6)
11B-294	Idle port rivet plug	(2)
11B-305	Rivet plug	(2)
11B-306	Rivet plug	
14-383S	Choke lever and screw assembly	
14-426S	Coil shaft lever and screw assembly	
14-439S	Choke piston lever link and shaft assembly	
14-440	Cam trip lever	
15-63S	Strainer nut assembly	(2)
17-70	PUMP CHECK NEEDLE	
20-26	Relief valve gasket	
20-126	Needle seat gasket	(2)

Part No.	PART NAME	
20-127	BOWL STRAINER GASKET	(2)
21-143S	Primary float and lever assembly	
21-168S	Secondary float and lever assembly	
24-24	Float lever pin	(2)
25-280S	PRIMARY NEEDLE AND SEAT ASSEMBLY	
25-289S	SECONDARY NEEDLE AND SEAT ASSEMBLY	
30-73	PRIMARY NEEDLE SEAT STRAINER	
30-74	SECONDARY FUEL INLET STRAINER	
30-75	BOWL STRAINER	
30A-58	Idle adjustment screw	(2)
30A-74	—Idle air adjustment screw	
39-11	Choke valve attaching screw	(2)
47-14	Welsh plug (piston housing)	
47-33	Welsh plug (spark port)	
48-253S	—Pump jet and housing assembly	
49-191S	Electro magnet plunger assembly (2584S)	
53A-333S	Pump operating lever and countershaft assembly	
53A-344	VENT ARM	
53A-405	Secondary operating lever	
53A-420S	—Lockout arm and pawl assembly	
61-84	Idle adjustment screw and air conditioning unit adjusting nut spring (2582S (3) (2583S (2) (2584S (4)	
61-128	CONNECTOR ROD SPRING	(2)
61-171	PUMP SPRING	
61-382	METERING ROD SPRING	
61-438	Diaphragm return spring (2584S)	
61-454	Fast idle cam spring	
61-474	Bowl vent spring	

Part No.	PART NAME	
61-483	SECONDARY THROTTLE RETURN SPRING	
61-502	Electro magnet plunger spring (2584S)	
61-530	Idle air adjustment screw spring (Sup by 61 598)	
61-552	Throttle flex spring	
61-580	VACUUM PISTON SPRING	
61-598	—Idle air adjustment screw spring	
63-35	Connector rod retainer	(2)
63-57	INTAKE CHECK BALL RETAINER	
63 58	Coil housing retainer	(3)
63-149	Bowl vent spring retainer	
64-193S	PUMP PLUNGER ROD SPRING AND RETAINER ASSEMBLY	
75-1347	—METERING ROD—STANDARD 071" x 06325" x 055"	(2)
86-12	Flange stud lock washer	(4)
86-58	Air conditioning unit lock washer (2584S)	
101-6	Pump arm clamp screw	
101-33	Metering rod arm clamp screw	
101-74	Throttle shaft screw	(2)
101-136	Coil housing attaching screw	(3)
101-142S	Electro magnet housing attaching screw and washer assembly (2584S)	(2)
101-149S	Body flange attaching screw and washer assembly	(4)
101-152S	Air horn attaching screw and washer assembly	
101-184S	Dust cover attaching screw and washer assembly	(2)
101-213S	Diaphragm cover attaching screw and washer assembly (2584S)	(6)
101-275	Piston housing attaching screw	
101-277S	Vent arm attaching screw and washer assembly	
101-278	Pump jet housing attaching screw	
101-298S	Body flange attaching screw and washer assembly	(2)
101-307S	Air horn attaching screw and washer assembly (2582S 2583S (8) (2584S (5)	
101 320	Auxiliary throttle valve attaching screw	(4)
101-324	Fast idle cam screw	
101-335S	Air horn attaching screw and washer assembly	(7)
101-337	Primary and secondary throttle valve attaching screw	(8)
101-354S	Coil shaft and choke lever clamp screw assembly	(2)
101-362S	Air horn attaching screw and washer assembly (2584S)	(3)
101-363	Piston housing attaching screw	(2)
101-429	—Fast idle adjustment screw (2582S 2584S)	
105A-10	Choke lever clamp screw nut	(2)
105A-11	Flange stud nut	(4)
105A-12	Air conditioning diaphragm unit lock nut (2584S)	
105A-49	Air conditioning unit to bracket attaching nut (2584S)	

Part No.	PART NAME	
105A-53	Air condition ng unit adjusting nut (2584S)	
111-47S	Pump arm and screw assembly	
111-60S	Metering rod arm and screw assembly	
114-127	Throttle shaft arm (outer)	
114-128	Throttle shaft arm (inner)	
114-148	—Throttle shaft arm (outer)	
115-288	—Choke connector rod	
115-289	—Choke connector rod (Climatic® Control side)	
115-290	—THROTTLE CONNECTOR ROD	
115-293	—Throttle operating rod	
116-13	PUMP INTAKE AND AIR CONDITIONING UNIT CHECK BALL (2582S 2583S (1) (2584S	(2)
117-162	Vacumeter piston link	
117-165	PUMP ARM LINK	
118-102S	Dust cover assembly	
120-160	PRIMARY METERING ROD JET	(2)
120-174	SECONDARY METERING JET	(2)
121-78	COIL HOUSING GASKET	
121-190	Electro magnet housing gasket (2584S)	
121-208	DUST COVER GASKET	
121-229	AIR CLEANER GASKET	
121-232	AIR HORN GASKET	
121-241	PUMP JET HOUSING GASKET	
121-277	BODY FLANGE GASKET	
121 298	—PISTON HOUSING GASKET	
122-75S	PUMP RELIEF VALVE ASSEMBLY	
136-37	Throttle operating rod washer	(2)
136-172	Secondary throttle shaft washer	
150 62	Choke piston pin	
150-168	Air conditioning unit diaphragm air bleed pin (2584S)	
150 186S	Pin and valve cap assembly	
150A-10	PIN SPRING	(5)
160-91	Choke piston	
160-110S	Vacuum p ston and pin assembly	
170-190	Inner diaphragm housing (2584S)	
170-298S	Outer diaphragm housing and plug assembly (2584S)	
170-513S	—Piston housing and plug assembly	
170AJ241S	Thermostatic coil and housing assembly	
180-97	—Air conditioning unit bracket (2584S)	
181-227S	Fast idle cam assembly (Sup by 181 244S)	
181-244S	—Fast idle cam assembly	
186-38S	Choke baffle plate and spring assembly	
202-106S	—Air conditioning unit diaphragm and shaft assembly (2584S)	
202-111U	—Unitized package (Consists of 3—101 362S and 1—202 107S) (2582S 2584S)	
213-21S	—Electro magnet and housing assembly (2584S)	

—Parts so marked are new and listed for the first time

WCFB Four Bore Down-Draft Climatic® Control Carbureters

Nos. 2543S-2544S-2545S

CARBURETER SPECIFICATIONS

For Cadillac 8 Cylinder Engine: 4 Inch Bore, 3⅝ Inch Stroke

Dimensions: Flange Four Bore—4 bolt type size 1¼ inch
Primary venturi size 11/32 inch (I D)
Main venturi size 1-3/16 inch (primary side) and (secondary side)

Vent: Inside (5) Outside in flange (4)

Gasoline Intake: Size No 38 (1015 inch) drill hole in needle seat

Low Speed Jet Tube: Jet, (primary and secondary) size No 67 (032 inch) drill
By-pass in body size 057 inch diameter
Economizer in body, size No 54 (055 inch) drill
Idle bleed in body size 0826 inch diameter

Idle Port: (Upper) slot type Primary length 175 inch widtn 030 inch
Secondary, length 100 inch, width 030 inch

Idle Port Opening: Primary 091 to 097 inch secondary 050 to 056 inch above upper edge of valve with valve tightly closed

Lower Port: Primary (for idle adjustment screw), size No 51 (067 inch) drill Secondary, none

Set Idle Adjustment Screw: 1 to 2 turns open For richer mixture turn screw out Do not idle engine below 420 R P M (Transmission in Drive Range) For cars with air conditioning set idle with air conditioning on (Transmission in Drive Range)

Idle Air Adjusting Screw: Seat size 240 inch diameter

Main Nozzle: Installed permanently DO NOT REMOVE. Anti-percolating jet (Primary), size No 70 (028 inch) drill Anti-percolating jet (secondary) to idle well, size No 70 (028 inch) drill

Metering Rod: Primary, economy step 0705 inch diameter.
Middle step tapers to 064 inch diameter
Power step 040 inch diameter
Secondary, none

Metering Rod Jet: Primary, size 098 inch diameter (for metering rod) Secondary size 067 inch diameter (No metering rod)

Accelerating Pump: Discharge jet (twin) primary only, size No. 74 (0225 inch) drill
Intake ball check seat, size 115 to 120 inch diameter
Discharge needle seat, size 070 inch diameter
Relief ball check, size No 55 (052 inch) drill
Relief passage (vent) to fuel chamber No 42 (0935 inch) drill

Choke: Carter Climatic® Control, set one point lean Butterfly type offset choke valve, primary side only Choke heat suction hole restriction in piston housing, size No 44 (086 inch) drill

Vacuum Spark Port: Half Round type, 180 inch diameter—091 inch wide Top of port 027 to 035 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighen manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .0125"-.0175"	Ignition Timing Breaker Points to Open: 5° B. T. C. At "A" Mark	Float Setting Primary ⅛ Inch (Use Gauge T109-232) Secondary 3/16 Inch (Use Gauge T109-222)	Idle Adjustment Screw Setting 1 to 2 Turns Open Idle Engine at 420 R.P.M. In Drive Range

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vert cal

LATERAL ADJUSTMENT With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portions of gauge fitted over edges of casting Sides of floats should just clear the vertical upright of float gauge Adjust ment should be made by bending arms of floats

VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge The vertical d stance between top of float and machined surface of casting must be 1/8 inch (gauge T109 232) for primary floats and 3/16 inch (gauge T109 222) for secondary floats Adjust by bending float arms

FLOAT DROP ADJUSTMENT With bowl cover held in upright position and measuring from center of float the distance be tween top of floats and bowl cover should be 5/8 inch for pri mary floats and 11/16 inch for secondary floats Adjust by bending stop tabs on float bracket

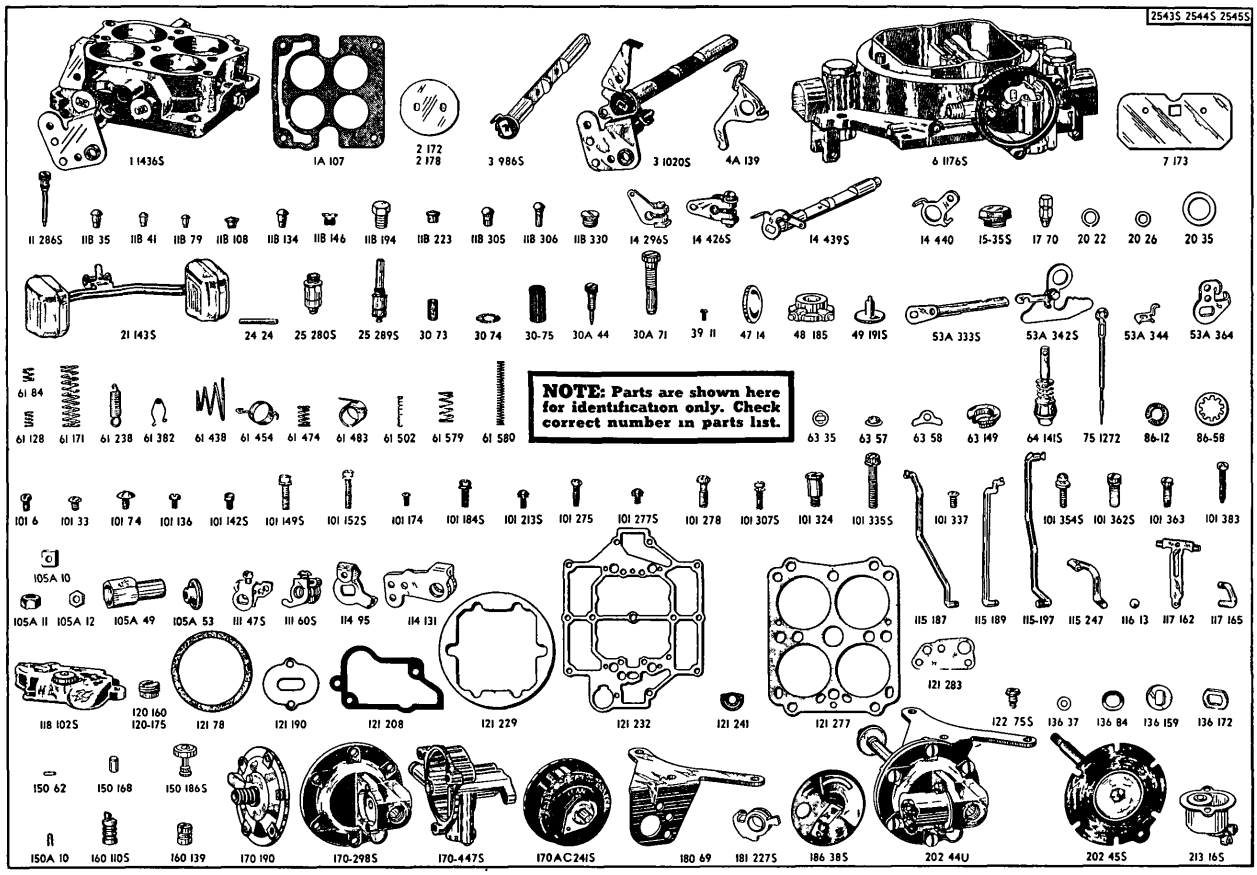
PUMP ADJUSTMENT Install pump connector link in outer hole (long stroke) of pump arm with ends extending toward counter shaft arm Seat throttle valves in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109 213)

METERING ROD ADJUSTMENT Metering rod adjustment is important and must be made after completing the pump ad justment No metering rod gauges are necessary Procedure is as follows 1 Seat throttle valves in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacumeter link until metering rods bot tom in carbureter body casting 3 Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

BOWL VAPOR VENT ADJUSTMENT This adjustment should be made after completing pump and metering rod adjustments Install dust cover gasket and dust cover Seat throttle valves in bores of carbureter There should be 1/16 inch (gauge T109 197) between lower edge of bowl vapor vent valve and dust cover To adjust remove dust cover and bend vapor vent arm

CHOKE MODIFIER ADJUSTMENT 1 Set Climatic® Control assembly one point lean 2 Loosen clamp screw 3 Remove lower end of connector rod 4 Rotate metal pointer until it is in line with raised pointer on coil housing 5 Align scribed line on lever so that it is straight up and down Hold in place and tighten clamp screw 6 Seat throttle valves (hold choke valve wide open) 7 Hold pointer as indicated in No 4 Lower end of rod must slide freely into hole in throttle arm Bend rod at upper angle to adjust

FAST IDLE AND SECONDARY THROTTLE LOCK OUT AD JUSTMENT 1 Preliminary Adjustment Loosen choke lever clamp screw on choke shaft Insert 015 inch feeler gauge (T109 44) between lip of fast idle cam and boss of flange cast ing Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and t ghten clamp screw 2 Secondary Throttle Lock Out Adjustment (a) With choke valve tightly closed tighten fast idle adjust ng screw until there is 015 inch (gauge T109 44) opening between primary throttle valve and bore of carbureter (side opposite idle port) Lock pawl should now be in unlocked pos tion if not adjust by bending tang on lock pawl (use bend ing tool T109 105) (b) Hold primary throttle valves half way open Open choke valve fully then open primary throttle valves all the way Tang on secondary throttle arm should engage in notch on lock out lever preventing secondary throttle shaft movement Keep choke valve in wide open position Close primary throttle valves so that lock pawl is unlocked then open primary throttle valves all the way Lock out lever should fall free allowing secondary throttle valves to be open before pri mary throttle valves are fully open If necessary bend tang on secondary throttle lever to provide clearance for proper opera tion of lock out lever



FAST IDLE ON CAR 1700 R P M (Hot)

UNLOADER ADJUSTMENT With throttle wide open there should be 13/64 inch (gauge T109 39) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109 41)

SECONDARY THROTTLE LEVER ADJUSTMENT Primary and secondary throttle valves should reach wide open position at the same time To adjust bend throttle operating rod at upper angle (Use bending tool T109 213) With primary and sec ondary throttle valves in tightly closed position there should be 017 022 inch (gauge T109 29) clearance between posit ve closing shoes on primary and secondary throttle levers To adjust bend shoe on primary lever

IDLE SPEED AND MIXTURE ADJUSTMENT (Normal Engine Temp) In making the idle adjustment on the engine the air adjustment screw is used to adjust idle speed in a similar man ner as the throttle speed screw used previously Turning the air adjustment screw outward increases engine speed but also leans the mixture supplied to the manifold which must be com pensated for by adjustment of the idle mixture adjusting screws

AIR CONDITIONER FAST IDLE DEVICE ADJUSTMENT This adjustment must be made after carbureter is installed on car engine at normal operating temperature and slow idle adjust ment s completed With shift lever in neutral and air condi tioner turned on engine should idle 900 RPM To adjust loosen lock nut on diaphragm shaft and adjust knurled nut to obtain specified RPM then tighten lock nut

WCFB Four Bore Down-Draft Climatic® Control Carbureters

Nos. 2333S-2333SA-2334S-2334SA-2370S-2370SA

CARBURETER SPECIFICATIONS

For Cadillac 8 Cylinder Engine 4 Inch Bore, 3⅝ Inch Stroke

Dimensions Flange Four Bore—4 bolt type size 1¼ inch
Primary venturi size 11/32 inch (1 D)
Main venturi size 1 3/16 inch (primary side) and (secondary side)

Vent Inside (5) Outside in flange (4)

Gasoline Intake Size No 38 (1015 inch) drill hole in needle seat

Low Speed Jet Tube Jet (primary and secondary) size No 67 (032 inch) drill
By pass in body size 057 inch diameter
Economizer in body size No 54 (055 inch) drill
Idle bleed in body size 0826 inch diameter

Idle Port (Upper) slot type Primary length 175 inch width 030 inch
Secondary length 100 inch width 030 inch

Idle Port Opening Primary 091 to 097 inch secondary 050 to 056 inch above upper edge of valve with valve tightly closed

Lower Port Primary (for idle adjustment screw) size No 53 (0595 inch) drill Secondary none

Set Idle Adjustment Screw 1¾ to 2¾ turns open For richer mixture turn screw out Do not idle engine below 420 R P M (Transmission in Drive Range) For cars with air conditioning set idle with air conditioning on (Transmission in Drive Range)

Idle Air Adjusting Screw Seat size (2333S 2334S 2370S) 187 inch diameter (2333SA 2334SA 2370SA) 221 inch diameter
Constant air bleed restriction size (2333S 2334S 2370S) No 49 (073 inch) drill

Main Nozzle Installed permanently DO NOT REMOVE Anti percolating jet (Primary) size No 70 (028 inch) drill Anti percolating jet (secondary) to idle well size No 70 (028 inch) drill

Metering Rod Primary economy step 0715 inch diameter
Middle step tapers to 064 inch diameter
Power step 040 inch diameter
Secondary none

Metering Rod Jet Primary size 096 inch diameter (for metering rod) Secondary size 070 inch diameter (No metering rod)

Accelerating Pump Discharge jet (twin) primary only size No 74 (0225 inch) drill
Intake ball check seat size 115 to 120 inch diameter
Discharge needle seat size 070 inch diameter
Relief ball check size No 55 (052 inch) drill
Relief passage (vent) to fuel chamber No 42 (0935 inch) drill

Choke Carter Climatic® Control set one point lean Butterfly type offset choke valve primary side only Choke heat suction hole restriction in piston housing size No 44 (086 inch) drill

Vacuum Spark Port Half Round type 180 inch diameter—091 inch wide Top of port 027 to 035 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

Spark Plug Gap 035"	Breaker Point Setting .0125"-.0175" Note Set Dwell Angle 31°	Ignition Timing Breaker Points to Open 5° B T C At 'A' Mark	Float Setting Primary 1/8 Inch (Use Gauge T109-232) Secondary 3/16 Inch (Use Gauge T109-222)	Idle Adjustment Screw Setting 1¾ to 2¾ Turns Open Idle Engine at 400 R P M In Drive Range

NOTE These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vertical

LATERAL ADJUSTMENT With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portions of gauge fitted over edges of casting Sides of floats should just clear the vertical upright of float gauge Adjustment should be made by bending arms of floats

VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge The vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109 232) for primary floats and 3/16 inch (gauge T109 222 for secondary floats Adjust by bending float arms

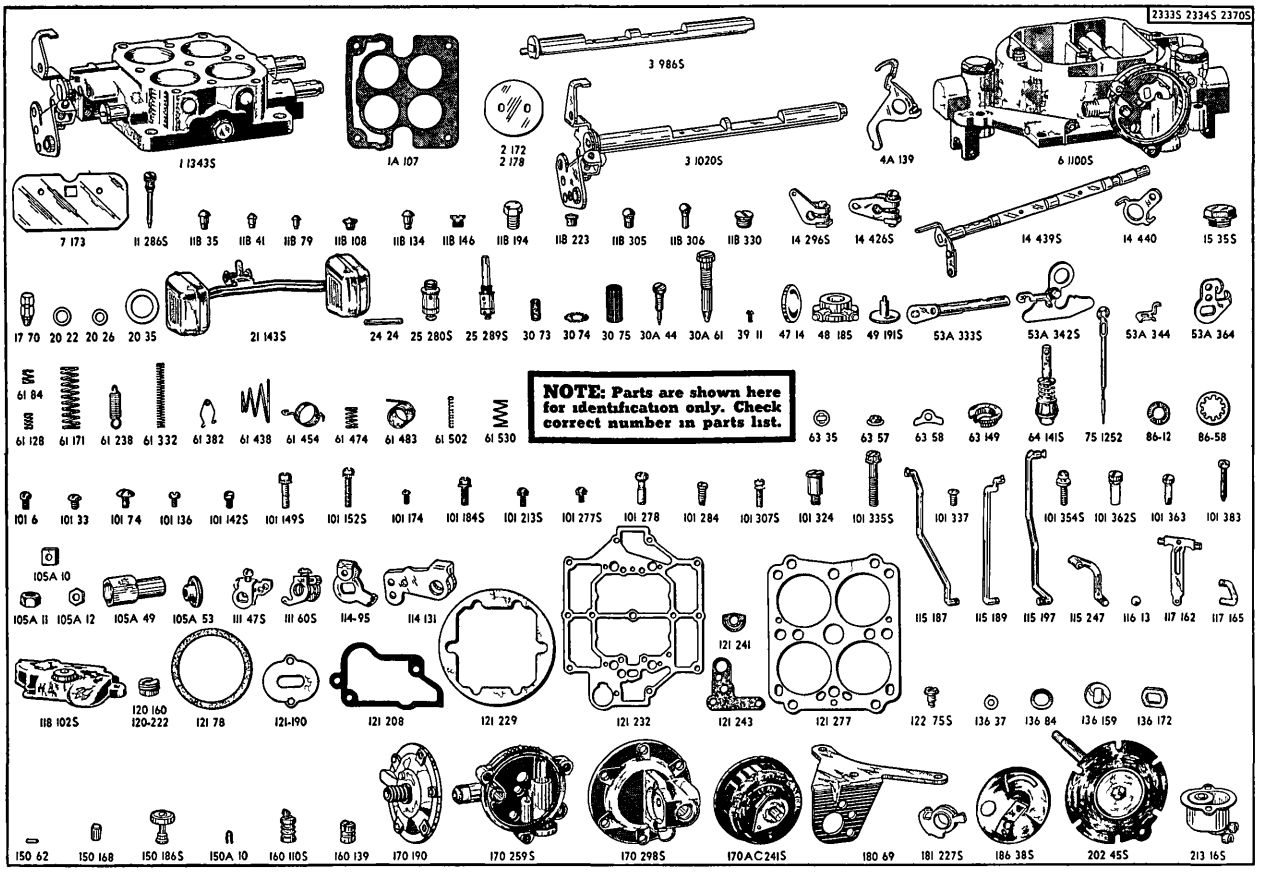
FLOAT DROP ADJUSTMENT With bowl cover held in upright position and measuring from center of float the distance between top of floats and bowl cover should be 5/8 inch for primary floats and 11/16 inch for secondary floats Adjust by bending stop tabs on float bracket

PUMP ADJUSTMENT Install pump connector link in outer hole (long stroke) of pump arm with ends extending toward countershaft arm Seat throttle valves in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109 213)

METERING ROD ADJUSTMENT Metering rod adjustment is important and must be made after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows 1 Seat throttle valves in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throtl'e valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

BOWL VAPOR VENT ADJUSTMENT This adjustment should be made after completing pump and metering rod adjustments Install dust cover gasket and dust cover Seat throttle valves in bores of carbureter There should be 1/16 inch (gauge T109 197) between lower edge of bowl vapor vent valve and dust cover To adjust remove dust cover and bend vapor vent arm

CHOKE MODIFIER ADJUSTMENT 1 Set Climatic® Control assembly one point lean 2 Loosen clamp screw 3 Remove lower end of connector rod 4 Rotate metal pointer until it is in line with raised pointer on coil housing 5 Align scribed line on lever so that it is straight up and down Hold in place and tighten clamp screw 6 Seat throttle valves (hold choke valve wide open) 7 Hold po nter as indicated in No 4 Lower end of rod must slide freely into hole in throttle arm Bend rod at upper angle to adjust



FAST IDLE AND SECONDARY THROTTLE LOCK-OUT ADJUSTMENT 1 Preliminary Adjustment Loosen choke lever clamp screw on choke shaft Insert 015 inch feeler gauge (T109 44) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw 2 Secondary Throttle Lock Out Adjustment (a) With choke valve tightly closed tighten fast idle adjusting screw until there is 015 inch (gauge T109 44) opening between primary throttle valve and bore of carbureter (side opposite idle port) Lock pawl should now be in unlocked position if not adjust by bending tang on lock pawl (use bending tool T109 105) (b) Hold primary throttle valves half way open Open choke valve fully then open primary throttle valves all the way Tang on secondary throttle arm should engage in notch on lock out lever preventing secondary throttle shaft movement Keep choke valve in wide open position Close primary throttle valves so that lock pawl is unlocked then open primary throttle valves all the way Lock out lever should fall free allowing secondary throttle valves to be open before primary throttle valves are fully open If necessary bend tang on secondary throttle lever to provide clearance for proper operation of lock out lever

UNLOADER ADJUSTMENT With throttle wide open there should be 13/64 inch (gauge T109 39) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109 41)

SECONDARY THROTTLE LEVER ADJUSTMENT Primary and secondary throttle valves should reach wide open position at the same time To adjust bend throttle operating rod at upper angle (Use bending tool T109 213) With primary and secondary throttle valves in tightly closed position there should be 017 022 inch (gauge T109 29) clearance between positive closing shoes on primary and secondary throttle levers To adjust bend shoe on primary lever

IDLE SPEED AND MIXTURE ADJUSTMENT (Normal Engine Temp) In making the idle adjustment on the engine the air adjustment screw is used to adjust idle speed in a similar manner as the throttle speed screw used previously Turning the air adjustment screw outward increases engine speed but also leans the mixture supplied to the manifold which must be compensated for by adjustment of the idle mixture adjusting screws

AIR CONDITIONER FAST IDLE DEVICE ADJUSTMENT This adjustment must be made after carbureter is installed on car engine at normal operating temperature and slow idle adjustment is completed With shift lever in neutral and air conditioner turned on engine should idle 900 RPM To adjust loosen lock nut on diaphragm shaft and adjust knurled nut to obtain specified RPM then tighten lock nut

Cadillac 8—1956—Carbureters Nos. 2333S-SA, 2334S-SA, 2370S-SA

WHEN SERVICING, USE GASKET ASSORTMENT No 277A, REPAIR PACKAGE No 1818A

PART NAMES IN CAPITAL LETTERS LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No	PART NAME	
1-1343S	Body flange assembly (2333S 2334S 2370S) (Sup by 1 1416S)	
1-1416S	Body flange assembly	
1A-107	FLANGE GASKET	
2-172	Secondary throttle valve	(2)
2-178	Primary throttle valve	(2)
3-986S	Secondary throttle shaft and dog assembly	
3-1020S	Primary throttle shaft lever and bushing assembly	
4A-139	Throttle shaft dog	
6-1100S	Air horn assembly (Casting No 6 1116) (Sup by 6 1176S)	
6-1176S	Air horn assembly (Casting No 6 1155)	
7-173	Choke valve

WCFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2371S-2372S-2373S**

CARBURETER SPECIFICATIONS

For Cadillac 8 Cylinder Engine: 4 Inch Bore, 3⅝ Inch Stroke

Dimensions: Flange Four Bore—4 bolt type, size 1¼ inch.
Primary venturi size, 11/32 inch (I. D.).
Main venturi size, 1-3/16 inch (primary side) and (secondary side).

Vent: Inside, (5).
Outside, in flange, (4).

Gasoline Intake: Size No. 38 (.1015 inch) drill hole in needle seat.

Low Speed Jet Tube: Jet, (primary only) size No. 69 (.0292 inch) drill. By-pass in body size .057 inch diameter.
Economizer, in body, size No. 54 (.055 inch) drill.
Idle bleed, in body, size No. 44 (.086 inch) drill.

Idle Port: (Upper) slot type, Primary, length .136 inch; width .030 inch.
Secondary, none.

Idle Port Opening: Primary, .061 to .067 inch, above upper edge of valve with valve tightly closed.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill.
Secondary, none.

Set Idle Adjustment Screw: ¾ to 1¾ turns open. For richer mixture turn screw out. Do not idle engine below 490-510 R.P.M. (Transmission in Drive Range). For cars with air conditioning set idle at 490 R.P.M. with air conditioning on (Transmission in Drive Range).

Idle Air Adjusting Screw: Seat size .187 inch diameter.
Constant air bleed restriction, None.

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating jet (Primary), size No. 70 (.028 inch) drill. Anti-percolating jet (secondary) to idle well, size No. 70 (.028 inch) drill.

Metering Rod: Primary, economy step .0705 inch diameter.
Middle step tapers to .064 inch diameter.
Power step .040 inch diameter.
Secondary, none.

Metering Rod Jet: Primary, size .096 inch diameter (for metering rod).
Secondary, size .059 inch diameter. (No metering rod.)

Accelerating Pump: Discharge jet (twin) primary only, size No. 69 (.029 inch) drill.
Intake ball check seat, size .115 to .120 inch diameter.
Discharge needle seat, size .070 inch diameter.
Relief ball check, size No. 55 (.052 inch) drill.
Relief passage (vent) to fuel chamber No. 42 (.0935 inch) drill.

Choke: Carter Climatic® Control, set on Index. Butterfly type, offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 44 (.086 inch) drill.

Vacuum Spark Port: Horizontal slot, round end type; .065 x .120 inch. Top of port .007 to .015 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .0125"-.0175" Note: Set Dwell Angle 31°	Ignition Timing Breaker Points to Open: 5° B.T.C. at "A" Mark	Float Setting Primary 1/8 Inch (Use Gauge T109-232) Secondary 3/16 Inch (Use Gauge T109-222)	Idle Adjustment Screw Setting ¾ to 1¾ Turns Open Idle Engine at 490 to 510 r.p.m. In Drive Rang

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vertical LATERAL ADJUSTMENT With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portions of gauge fitted over edges of casting Sides of floats should just clear the vertical upright of float gauge Adjustment should be made by bending arms of floats VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge The vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109 232) for primary floats and 3/16 inch (gauge T109 222) for secondary floats Adjust by bending float arms

FLOAT DROP ADJUSTMENT· With bowl cover held in upright position and measuring from center of float the distance between top of floats and bowl cover should be 5/8 inch for primary floats and 11/16 inch for secondary floats Adjust by bending stop tabs on float bracket

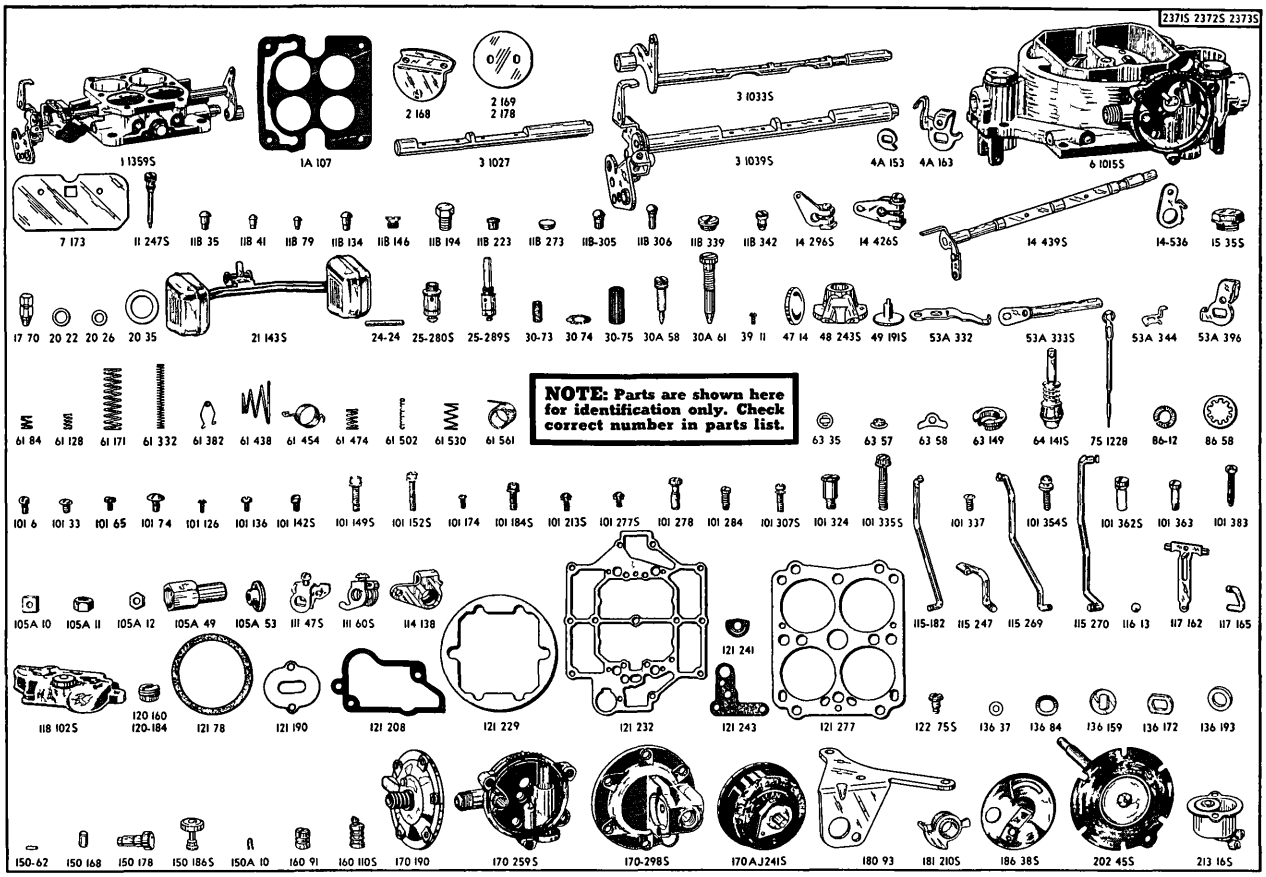
PUMP ADJUSTMENT Install pump connector link in outer hole (long stroke) of pump arm with ends extending toward counter shaft arm Seat throttle valves in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109 213)

METERING ROD ADJUSTMENT Metering rod adjustment is important and must be made after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows 1 Seat throttle valves in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

BOWL VAPOR VENT ADJUSTMENT· This adjustment should be made after completing pump and metering rod adjustments Install dust cover gasket and dust cover Seat throttle valves in bores of carbureter There should be 1/16 inch (gauge T109 197) between lower edge of bowl vapor vent valve and dust cover To adjust remove dust cover and bend vapor vent arm

CHOKE MODIFIER ADJUSTMENT 1 Set Climatic® Control assembly on index 2 Loosen clamp screw 3 Remove lower end of connector rod 4 Rotate metal pointer until it is in line with raised pointer on coil housing 5 Align scribed line on lever so that it is straight up and down Hold in place and tighten clamp screw 6 Seat throttle valves (hold choke valve wide open) 7 Hold pointer as indicated in No 4 Lower end of rod must slide freely into hole in throttle arm Bend rod at upper angle to adjust

FAST IDLE ADJUSTMENT (Front Carbureter Only) 1 Loosen choke lever clamp screw on choke shaft Insert 015 inch gauge (T109 44) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw 2 With choke valve tightly closed tighten fast idle adjusting screw until there is 015 inch (gauge T109 44) opening between primary throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjusting screw is on high step of cam while making this adjustment



UNLOADER ADJUSTMENT With throttle wide open there should be 13/64 inch (gauge T109 39) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109 41)

SECONDARY THROTTLE LEVER ADJUSTMENT Primary and secondary throttle valves should reach wide open position at the same time To adjust bend throttle operating rod at upper angle (Use bending tool T109 213) With primary and secondary throttle valves in tightly closed position there should be 017 022 inch (gauge T109 29) clearance between positive closing shoes on primary and secondary throttle levers To adjust bend shoe on primary lever

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT 1 With choke valve closed edge of hook on lock out arm should contact auxiliary throttle lever making maximum contact of locking step on lever 2 Open choke valve Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position Adjust by bending lock out arm

IDLE SPEED AND MIXTURE ADJUSTMENT (Normal Engine Temp) In making the idle adjustment on the engine the air adjustment screw is used to adjust idle speed in a similar manner as the throttle speed screw used previously Turning the air adjustment screw outward increases engine speed but also leans the mixture supplied to the manifold which must be compensated for by adjustment of the idle mixture adjusting screws

AIR CONDITIONER FAST IDLE DEVICE ADJUSTMENT This adjustment must be made after carbureter is installed on car engine at normal operating temperature and slow idle adjustment is completed With shift lever in neutral and air conditioner turned on engine should idle 900 R P M To adjust loosen lock nut on diaphragm shaft and adjust knurled nut to obtain specified R P M then tighten lock nut

Cadillac 8—1956—Carbureters Nos. 2371S-2372S-2373S

WHEN SERVICING, USE GASKET ASSORTMENT No. 277A; REPAIR PACKAGE No. 1819

PART NAMES IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No.	PART NAME	
1-1359S	—Body flange assembly	
1A-107	—FLANGE GASKET	
2-168	Auxiliary throttle valve	(2)
2-169	Secondary throttle valve	(2)
2-178	—Primary throttle valve	(2)
3-1027	—Secondary throttle shaft	
3-1033S	—Auxiliary throttle shaft, lever and weight assembly	
3-1039S	—Primary throttle shaft and lever assembly	
4A-153	—Auxiliary throttle shaft dog	
4A-163	—Throttle shaft dog	
6-1015S	Air horn assembly (Casting No 6 950) (Sup by 6 1177S)	
6-1177S	—Air horn assembly (Casting No 6 1144)	
7-173	Choke valve	
11-247S	LOW SPEED JET ASSEMBLY	(2)
11B-35	Rivet plug	(4)
11B-41	Rivet plug (6 1015S (2) (6 1177S (1)	
11B-79	Rivet plug	(4)
11B-134	Rivet plug (2371S 2372S (1) (2373S (2)	
11B-146	Level sight plug	(2)
11B-194	Pipe plug (2371S (2) (2372S 2373S (1)	
11B-223	Nozzle passage rivet plug	(6)
11B-273	Secondary throttle shaft rivet plug	
11B-305	Rivet plug (6 1015S (1) (6 1177S) (2)	
11B-306	Rivet plug (6 1015S (2) (6 1177S (1)	
11B-339	—Flange plug	
11B-342	—Secondary low speed passage screw plug	(2)
14-296S	Choke lever and screw assembly	
14-426S	Coil shaft lever and screw assembly	
14-439S	Choke piston lever, link and shaft assembly	
14-536	—Cam trip lever	
15-35S	Strainer nut assembly	(2)
17-70	PUMP CHECK NEEDLE	
20-22	Needle seat gasket	(2)
20-26	Relief valve gasket	
20-35	BOWL STRAINER GASKET	(2)
21-143S	Float and lever assembly	(2)
24-24	Float lever pin	(2)
25-280S	PRIMARY NEEDLE AND NEEDLE SEAT ASSEMBLY	
25-289S	SECONDARY NEEDLE AND NEEDLE SEAT ASSEMBLY	
30-73	PRIMARY NEEDLE SEAT STRAINER	
30-74	SECONDARY FUEL INLET STRAINER	
30-75	BOWL STRAINER	
30A-58	Idle adjustment screw	(2)
30A-61	Idle air adjustment screw

53A-333S	Pump operating lever and countershaft assembly	
53A-344	VENT ARM	

Part No.	PART NAME
53A-396	—Secondary operating lever
61-84	Idle adjustment screw and air conditioning unit adjusting nut spring (2371S 2372S (2) (2373S (3)
61-128	CONNECTOR ROD SPRING (2)
61-171	PUMP SPRING
61-332	†Vacuum piston spring (Sup by 61 580)
61-382	METERING ROD SPRING
61-438	Diaphragm return spring (2373S)
61-454	Fast idle cam spring
61-474	Bowl vent spring
61-502	Electro magnet plunger spring (2373S)
61-530	Idle air adjustment screw spring
61-561	—SECONDARY THROTTLE RETURN SPRING
61-580	—VACUUM PISTON SPRING
63-35	CONNECTOR ROD RETAINER (2)
63-57	INTAKE CHECK BALL RETAINER
63-58	Coil housing retainer (3)
63-149	Bowl vent spring retainer
64-141S	Pump plunger, rod, spring and retainer assembly (Sup by 64 193S)
64-193S	—PUMP PLUNGER ROD SPRING AND RETAINER ASSEMBLY
75-1228	—†Metering rod—standard (Sup by 75 1272) (2)
75-1261U	—Metering rod and jet unit for altitude use (Consists of 2—75 1259 and 2—120 174) (Sup by 75 1301U)
75-1272	—METERING ROD—STANDARD
75-1301U	—Metering rod and jet unit for altitude use (Consists of 1—61 332 2—75 1299 and 2—120 193)
86-12	Flange stud lock washer (4)
86-58	Air conditioning unit lock washer (2373S)
101-6	Pump arm clamp screw
101-33	Metering rod arm clamp screw
101-65	Choke baffle plate attaching screw
101-74	Throttle shaft screw (2)
101-126	Auxiliary throttle valve attaching screw (4)
101-136	Coil housing attaching screw (3)
101-142S	Electro magnet housing attaching screw and washer assembly (2373S) (2)
101-149S	Body flange attaching screw and washer assembly (4)
101-152S	Air horn attaching screw and washer assembly
101 174	Primary throttle valve attaching screw (4)
101-184S	Dust cover attaching screw and washer assembly (2)
101-213S	Diaphragm cover attaching screw and washer assembly (2373S) (6)
101 275	Piston housing attaching screw (Use with 6 1177S)
101-277S	Vent arm attaching screw and washer assembly
101-278	Pump jet housing attaching screw
101-284	Piston housing attaching screw (6 1015S (2)
101-307S	Air horn attaching screw and washer assembly (2371S 2372S (8) (2373S (5)
101 324	Fast idle cam screw
101-335S	Air horn attaching screw and washer assembly (7)
101-337	Secondary throttle valve attaching screw (4)
101-354S	Coil shaft and choke lever clamp screw assembly (2)
101-362S	Air horn attaching screw and washer assembly (2373S) (3)
101-363	Piston housing attaching screw (6 1015S (1) (6 1177S (2)
101-383	Fast idle adjustment screw (2371S 2373S)
105A-10	Choke lever clamp screw nut (2)
105A-11	Flange stud nut (4)
105A-12	Air conditioning diaphragm unit lock nut (2373S)
105A-49	Air conditioning unit to bracket attaching nut (2373S)
105A-53	Air conditioning unit adjusting nut (2373S)
111-47S	Pump arm and screw assembly
111-60S	Metering rod arm and screw assembly
114-138	—Inner throttle shaft arm
115-182	Choke connector rod
115-247	Throttle operating rod
115-269	—Choke connector rod (Climatic® control side)
115-270	—THROTTLE CONNECTOR ROD
116-13	PUMP INTAKE AND AIR CONDITIONING UNIT CHECK BALL (2371S 2372S (1) (2373S (2)
117-162	Vacumeter piston link
117-165	PUMP ARM LINK
118-102S	Dust cover assembly
120-160	PRIMARY METERING ROD JET (2)
120-184	SECONDARY METERING JET (2)
121-78	COIL HOUSING GASKET
121-190	Electro magnet housing gasket (2373S)
121-208	DUST COVER GASKET
121-229	AIR CLEANER GASKET
121-232	AIR HORN GASKET
121-241	PUMP JET HOUSING GASKET
121-243	PISTON HOUSING GASKET (Use with 6 1015S)
121-277	—BODY FLANGE GASKET
121-283	PISTON HOUSING GASKET (Use with 6 1177S)
122-75S	PUMP RELIEF VALVE ASSEMBLY
136-37	Throttle operating rod washer (2)
136-159	Primary throttle shaft washer
136-172	Secondary throttle shaft washer
136-193	—Fast idle cam attaching screw washer
150-62	Choke piston pin
150-168	Air conditioning unit diaphragm air bleed pin (2373S)
150-178	Auxiliary valve lockout arm pin
150-186S	Pin and valve cap assembly
150A-10	PIN SPRING (5)
160-91	Choke piston
160-110S	Vacuum piston and pin assembly
170-190	Inner diaphragm housing (2373S)
170-259S	Piston housing and plug assembly (Use with 6 1015S)
170-298S	Outer diaphragm housing and plug assembly (2373S)
170-447S	—Piston housing and plug assembly (Use with 6 1177S)
170AJ241S	Thermostatic coil and housing assembly
180-93	—Air conditioning unit bracket (2373S)
181-210S	Fast idle cam assembly
186-38S	Choke baffle plate and spring assembly
202-100U	—Unitized package (Consists of 3—101 362S and 1—202 97S) (2371S 2373S)
202-45S	Air conditioning unit diaphragm and shaft assembly (2373S)
213-16S	Electro magnet and housing assembly (2373S)

—Parts so marked are new and listed for the first tim .

†When replacing 61 332 and 75 1228 with 61 580 and 75 1272 a different accumulator inner spring (Cadillac part) must be installed in the automatic transmission See Carter bulletin Cadillac No 4 dated 2 29 56

NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown, only one is used

WCFB Four Bore Down-Draft Climatic® Control Carbureters

Nos. 2354S-2355S

CARBURETER SPECIFICATIONS

For Cadillac 8 Cylinder Engine 3 13/16 Inch Bore, 3⅝ Inch Stroke

Dimensions Flange Four Bore — 4 bolt type size 1⅛ inch (primary side) and 1¼ inch (secondary side)
Primary venturi size 11/32 inch (I D)
Main venturi size 1 1/16 inch (primary side) and 1 3/16 inch (secondary side)

Float Level See adjustments

Vent Outside None
Inside balance vent tube in air horn 2 on primary side 3 on secondary side

Gasoline Intake Size No 38 (1015 inch) drill hole in needle seat

Low Speed Jet Tube Jet size No 70 (028 inch) drill By pass (2 in low speed jet) size No 54 (055 inch) drill
Economizer in body size No 54 (055 inch) drill
Idle bleed in body size No 52 (0635 inch) drill

Idle Port (Upper) slot type Primary length 175 inch width 030 inch
Secondary length 100 inch width 030 inch

Idle Port Opening Primary 091 to 097 inch secondary 050 to 056 inch above upper edge of valve with valve tightly closed

Lower Port Primary (for idle adjustment screw) size No 53 (0595 inch) drill
Secondary None

Set Idle Adjustment Screw ¾ to 1¾ turns open For richer mixture turn screw out Do not idle engine below 400 RPM (Transmission in Drive range)

Main Nozzle Installed permanently DO NOT REMOVE Anti percolating jet (secondary only) size No 70 (028 inch) drill

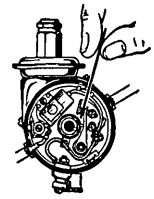
Metering Rod Primary economy step 0715 inch diameter
Middle step tapers to 067 inch diameter
Power step 053 inch diameter
Secondary None

Metering Rod Jet Primary size 0935 inch diameter (for metering rod)
Secondary size 082 inch diameter (No metering rod)

Metering Rod Setting See adjustments

Accelerating Pump Discharge jet (twin) primary only size No 74 (0225 inch) drill
Intake ball check seat size 115 to 120 inch diameter
Discharge needle seat size 070 inch diameter
Relief ball check size No 55 (052 inch) drill
Relief passage (vent) to fuel chamber No 42 (0935 inch) drill

Choke Carter Climatic® Control set one point lean Butterfly type offset choke valve primary side only Choke heat suction hole restriction in piston housing size No 44 (086 inch) drill



Vacumm Spark Port Round type 127 to 129 inch diameter Top of port 035 to 043 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vertical

LATERAL ADJUSTMENT With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portions of gauge fitted over edges of casting Sides of floats should just clear the vertical upright of float gauge Adjust ment should be made by bending arms of floats

VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge The vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109 232) for primary floats and 3/16 inch (gauge T109 222) for secondary floats Adjust by bending float arms

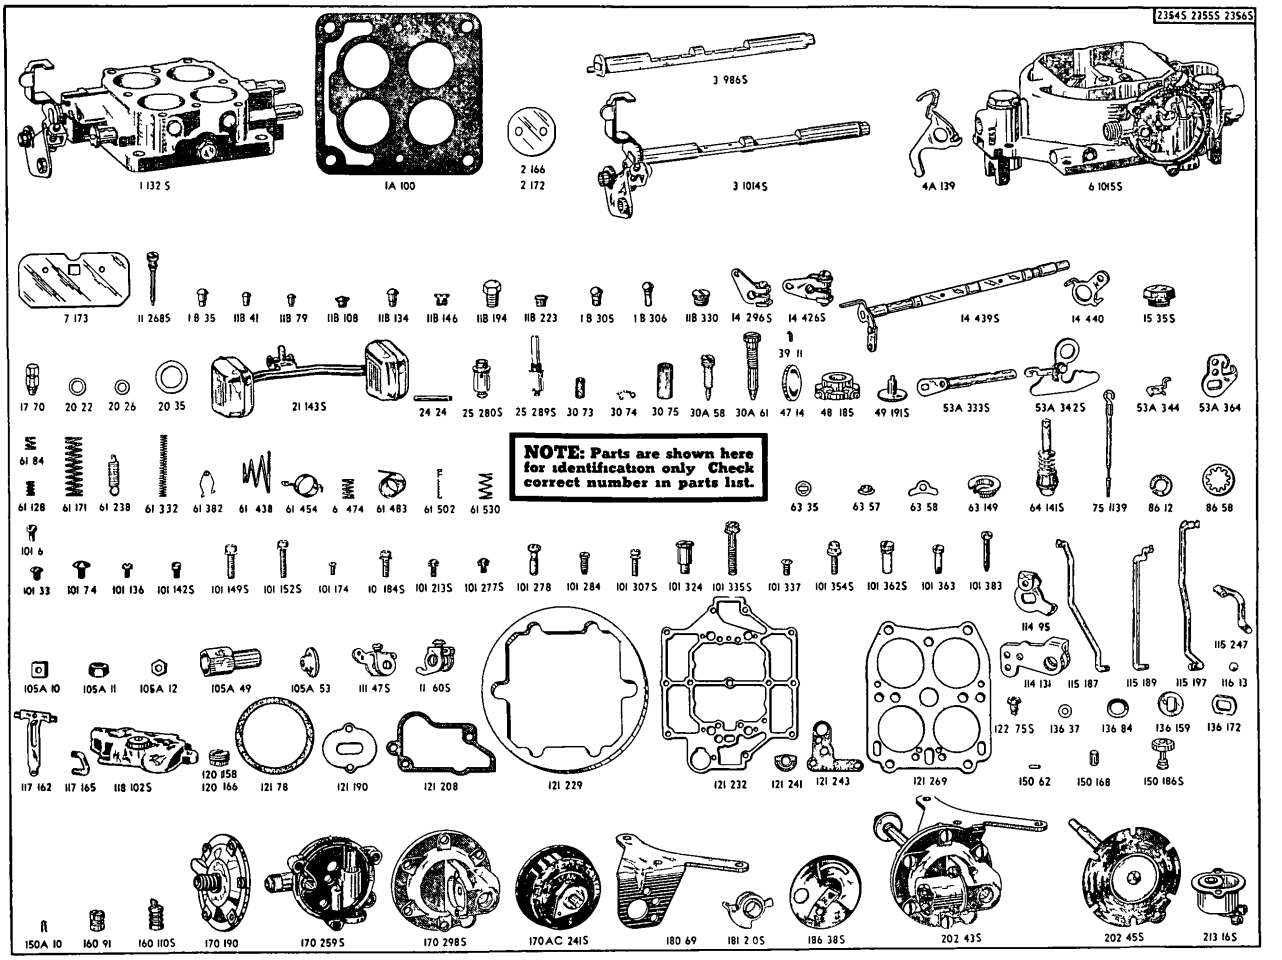
FLOAT DROP ADJUSTMENT With bowl cover held in upright position and measuring from center of float the distance be tween top of floats and bowl cover should be 5/8 inch for pri mary floats and 11/16 inch for secondary floats Adjust by bending stop tabs on float bracket

PUMP ADJUSTMENT Install pump connector link in outer hole (long stroke) of pump arm with ends extending toward counter shaft arm Seat throttle valves in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109 213)

METERING ROD ADJUSTMENT Metering rod adjustment is important and must be made after completing the pump ad justment No metering rod gauges are necessary Procedure is as follows 1 Seat throttle valves in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacumeter link until metering rods bot tom in carbureter body casting 3 Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

BOWL VAPOR VENT ADJUSTMENT This adjustment should be made after completing pump and metering rod adjustments Install dust cover gasket and dust cover Seat throttle valves in bores of carbureter There should be 1/16 inch (gauge T109 197) between lower edge of bowl vapor vent valve and dust cover To adjust remove dust cover and bend vapor vent arm

CHOKE MODIFIER ADJUSTMENT 1 Set Climatic® Control assembly one point lean 2 Loosen clamp screw 3 Remove lower end of connector rod 4 Rotate metal pointer until it is in line with raised pointer on coil housing 5 Align scribed line on lever so that it is straight up and down Hold in place and tighten clamp screw 6 Seat throttle valves (hold choke valve wide open) 7 Hold pointer as indicated in No 4 Lower end of rod must slide freely into hole in throttle arm Bend rod at upper angle to adjust



FAST IDLE AND SECONDARY THROTTLE LOCK-OUT AD JUSTMENT 1 Preliminary Adjustment Loosen choke lever clamp screw on choke shaft Insert 020 inch feeler gauge (T109 29) between lip of fast idle cam and boss of flange cast ing Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw 2 Secondary Throttle Lock Out Adjustment (a) With choke valve tightly closed tighten fast idle adjusting screw until there is 015 inch (gauge T109 44) opening between primary throttle valve and bore of carbureter (side opposite idle port) Lock pawl should now be in unlocked position if not adjust by bending tang on lock pawl (use bend ing tool T109 105) (b) Hold primary throttle valves half way open Open choke valve fully then open primary throttle valves all the way Tang on secondary throttle arm should engage in notch on lock out lever preventing secondary throttle shaft movement Keep choke valve in wide open position Close primary throttle valves so that lock pawl is unlocked then open primary throttle valves all the way Lock out lever should fall free allowing secondary throttle valves to be open before pri mary throttle valves are fully open If necessary bend tang on secondary throttle lever to provide clearance for proper opera tion of lock out lever

UNLOADER ADJUSTMENT With throttle wide open there should be 13/64 inch (gauge T109 39) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109 41)

SECONDARY THROTTLE LEVER ADJUSTMENT Primary and secondary throttle valves should reach wide open position at the same time To adjust bend throttle operating rod at upper angle (Use bending tool T109 213) With primary and sec ondary throttle valves in tightly closed position there should be 017 022 inch (gauge T109 29) clearance between positive closing shoes on primary and secondary throttle levers To adjust bend shoe on primary lever

AIR CONDITIONER FAST IDLE DEVICE ADJUSTMENT This adjustment must be made after carbureter is installed on car engine at normal operating temperature and slow idle adjust ment is completed With shift lever in neutral and air condi tioner turned on engine should idle 900 RPM To adjust loosen lock nut on diaphragm shaft and adjust knurled nut to obtain specified RPM then tighten lock nut

IDLE SPEED AND MIXTURE ADJUSTMENT (Normal Engine Temp) In making the idle adjustment on the engine the air adjustment screw is used to adjust idle speed in a similar man ner as the throttle speed screw used previously Turning the air adjustment screw outward increases engine speed but also leans the mixture supplied to the manifold which must be com pensated for by adjustment of the idle mixture adjusting screws

Cadillac 8—1955—Carbureters Nos. 2354S-2355S

WHEN SERVICING, USE GASKET ASSORTMENT No 263, REPAIR PACKAGE No 1792A

PART NAMES IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No	PART NAME	
1-1321S	Body flange assembly	
1A-100	FLANGE GASKET	
2-166	Primary throttle valve	(2)
2-172	Secondary throttle valve	(2)
3-986S	Secondary throttle shaft and dog ass y	
3-1014S	Primary throttle shaft lever and bushing ass'y	
4A-139	Throttle shaft dog	
6-1015S	Air horn assembly	
7-173	Choke valve	
11-268S	LOW SPEED JET ASSEMBLY	(4)
11B-35	Rivet plug	(4)
11B-41	Rivet plug	(2)
11B-79	Rivet plug	(4)
11B-108	Idle port rivet plug	(4)
11B-134	Rivet plug (2354S (1) (2355S (2)	
11B-146	Level sight plug	(2)
11B-194	Pipe plug	
11B-223	Nozzle passage rivet plug	(4)
11B-305	Rivet plug	
11B-306	Rivet plug	(2)
11B-330	Flange plug	
14-296S	Choke lever and screw assembly	
14-426S	Coil shaft lever and screw assembly	
14-439S	Choke piston lever link and shaft ass y	
14-440	Cam trip lever	
15-35S	Strainer nut assembly	(2)
17-70	PUMP CHECK NEEDLE	

Part No	PART NAME	
20-22	Needle seat gasket	(2)
20-26	Relief valve gasket	
20-35	BOWL STRAINER GASKET	(2)
21-143S	Float and lever assembly	(2)
24-24	Float lever pin	(2)
25-280S	PRIMARY NEEDLE AND SEAT ASSEMBLY	
25-289S	SECONDARY NEEDLE AND SEAT ASSEMBLY	
30-73	PRIMARY NEEDLE SEAT STRAINER	
30-74	SECONDARY FUEL INLET STRAINER	
30-75	BOWL STRAINER	
30A-58	Idle adjustment screw	(2)
30A-61	Idle air adjustment screw	
39-11	Choke valve attaching screw	(2)
47-14	Welsh plug	
48-185	Pump jet housing	
49-191S	Electro magnet plunger assembly (2355S)	
53A-333S	Pump operating lever and countershaft ass y	
53A-342S	Lockout arm and pawl assembly	
53A-344	VENT ARM	
53A-364	Secondary operating lever	
61-84	Idle adjustment screw and air conditioning unit adjustment nut spring (2354S (2) (2355S (3)	
61-128	CONNECTOR ROD SPRING	(2)
61-171	PUMP SPRING	
61-238	Throttle flex spring	
61-332	VACUUM PISTON SPRING	

Part No	PART NAME	
61-382	METERING ROD SPRING	
61-438	Diaphragm return spring (2355S)	
61-454	Fast idle cam spring	
61-474	Bowl vent spring	
61-483	SECONDARY THROTTLE RETURN SPRING	
61-502	Electro magnet plunger spring (2355S)	
61-530	Idle air adjustment screw spring	
63-35	Connector rod spring retainer	(2)
63-57	CHECK BALL RETAINER	
63-58	Coil housing retainer	(3)
63-149	Bowl vent spring retainer	
64-141S	PUMP PLUNGER ROD SPRING AND RETAINER ASS Y	
75-1139	METERING ROD—STANDARD	(2)
75-1201U	Metering rod and jet unit for altitude use (Consists of 1—61 246 2—75 1199 and 2—120 194) (Sup by 75 1300U)	
75 1300U	—Metering rod and jet unit for altitude use (Consists of 2—75 1298 and 2—120 176)	
86-12	Flange stud lock washer	(4)
86-58	Air conditioning unit lock washer (2355S)	
101-6	Pump arm clamp screw	
101-33	Metering rod arm clamp screw	
101-74	Throttle shaft screw	(2)
101-136	Coil housing attaching screw	(3)
101-142S	Electro magnet housing attaching screw and washer assembly (2355S)	(2)
101-149S	Body flange attaching screw and washer ass y	(4)
101-152S	Air horn attaching screw and washer assembly	
101-174	Primary throttle valve attaching screw	(4)
101-184S	Dust cover attaching screw and washer ass y	(2)
101-213S	Diaphragm cover attaching screw and washer assembly (2355S)	(6)
101-277S	Vent arm attaching screw and washer ass y	
101-278	Pump jet housing attaching screw

WCFB Four Bore Down-Draft Climatic® Control Carbureters

Nos. 2185S-2186S-2255S-2266S-2267S

CARBURETER SPECIFICATIONS

For Cadillac 8 Cylinder Engine: 3-13/16 Inch Bore, 3⅝ Inch Stroke

Dimensions: Flange Four Bore—4 bolt type, size (2185S-2186S) 1⅛ inch; (2255S-2266S-2267S) 1⅛ inch (primary side) and 1¼ inch (secondary side).
Primary venturi size, 11/32 inch (I. D.).
Main venturi size, (2185S-2186S) 1-1/16 inch; (2255S-2266S-2267S) 1-1/16 inch (primary side) and 1-3/16 inch (secondary side).

Float Level: See adjustments.

Vent: Outside, None.
Inside, balance vent tube in air horn; 2 on primary side, 3 on secondary side.

Gasoline Intake: Size No. 38 (.1015 inch) drill hole in needle seat.

Low Speed Jet Tube: Jet, size No. 70 (.028 inch) drill. By-pass (2 in low speed jet), size No. 54 (.055 inch) drill.
Economizer, in body, size No. 54 (.055 inch) drill.
Idle bleed, in body, size No. 52 (.0635 inch) drill.

Idle Port: (Upper) slot type. Primary, length .175 inch; width .030 inch.
Secondary, length .100 inch; width .030 inch.

Idle Port Opening: Primary, .091 to .097 inch, secondary, .050 to .056 inch above upper edge of valve with valve tightly closed.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill.
Secondary, None.

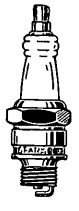
Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Do not idle engine below 400 RPM. (Transmission in Drive range).

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating jet (secondary only), size No. 70 (.028 inch) drill.

Metering Rod: Primary, economy step .0715 inch diameter.
Middle step tapers to .067 inch diameter.
Power step, .053 inch diameter.
Secondary, None.

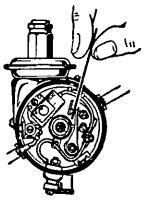
Metering Rod Jet: Primary, size .0935 inch diameter (for metering rod).
Secondary, size, (2185S-2186S) .067 inch diameter; (2255S-2266S-2267S) .082 inch diameter. (No metering rod).

Metering Rod Setting: See adjustments.



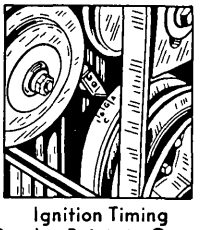
Accelerating Pump: Discharge jet (twin) primary only, size No. 74 (.0225 inch) drill.
Intake ball check seat, size .115 to .120 inch diameter.
Discharge needle seat, size .070 inch diameter.
Relief ball check, size No. 55 (.052 inch) drill.
Relief passage (vent) to fuel chamber No. 42 (.0935 inch) drill.

Choke: Carter Climatic® Control, set one point lean. Butterfly type, offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 44 (.086 inch) drill.

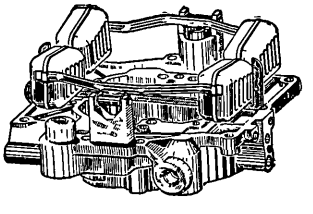


Vacuum Spark Port: Round type, .127 to .129 inch diameter. Top of port .035 to .043 inch above top edge of valve with valve tightly closed.

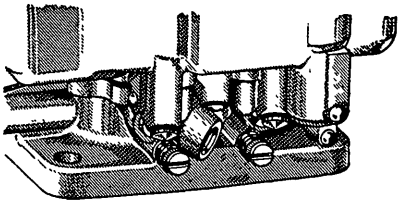
Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting .0125"-.0175"

Ignition Timing Breaker Points to Open: 21½° B. T. C. ½ Distance C to A Distributor vacuum line disconnected

Float Setting See Adjustments

Idle Adjustment Screw Setting ½ to 1½ Turns Open

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vertical

LATERAL ADJUSTMENT With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portions of gauge fitted over edges of casting Sides of floats should just clear the vertical upright of float gauge Adjustment should be made by bending arms of floats

VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge The vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109 232) for primary floats and 3/16 inch (gauge T109 222) for secondary floats Adjust by bending float arms

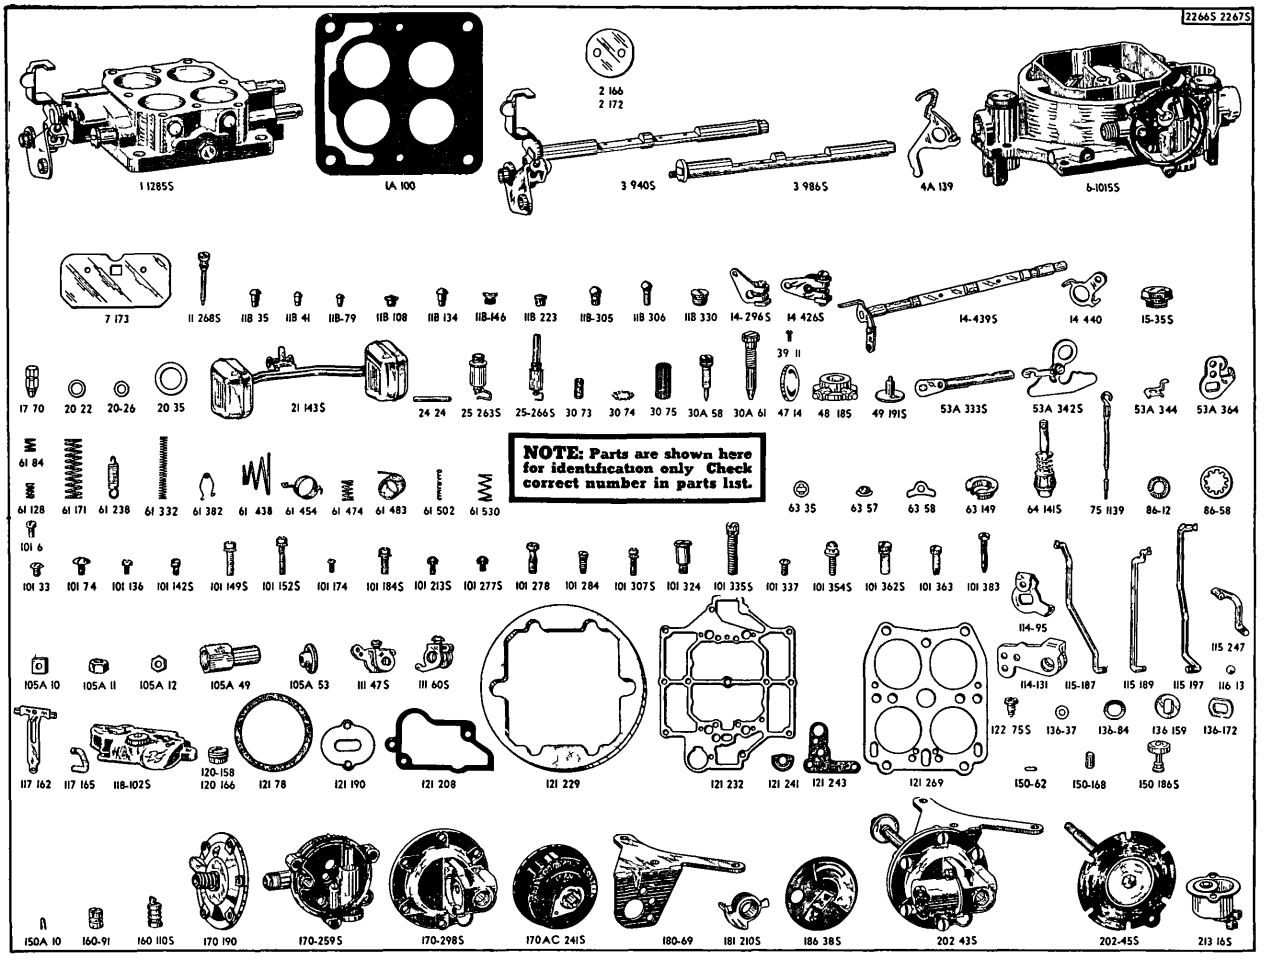
FLOAT DROP ADJUSTMENT With bowl cover held in upright position and measuring from center of float the distance between top of floats and bowl cover should be 5/8 inch for primary floats and 11/16 inch for secondary floats Adjust by bending stop tabs on float bracket

PUMP ADJUSTMENT Install pump connector link in outer hole (long stroke) of pump arm with ends extending toward counter shaft arm Seat throttle valves in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109 213)

METERING ROD ADJUSTMENT Metering rod adjustment is important and must be made after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows 1 Seat throttle valves in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

BOWL VAPOR VENT ADJUSTMENT This adjustment should be made after completing pump and metering rod adjustments Install dust cover gasket and dust cover Seat throttle valves in bores of carbureter There should be 1/16 inch (gauge T109 197) between lower edge of bowl vapor vent valve and dust cover To adjust remove dust cover and bend vapor vent arm

CHOKE MODIFIER ADJUSTMENT 1 Set Climatic® Control assembly on one point lean 2 Loosen clamp screw 3 Remove lower end of connector rod 4 Rotate metal pointer until it is in line with raised pointer on coil housing 5 Align scribed line on lever so that it is straight up and down Hold in place and tighten clamp screw 6 Seat throttle valves (hold choke valve wide open) 7 Hold pointer as indicated in No 4 Lower end of rod must slide freely into hole in throttle arm Bend rod at upper angle to adjust



FAST IDLE AND SECONDARY THROTTLE LOCK-OUT ADJUSTMENT 1 Preliminary Adjustment Loosen choke lever clamp screw on choke shaft Insert 020 inch feeler gauge (T109 29) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw 2 Secondary Throttle Lock Out Adjustment (a) With choke valve tightly closed tighten fast idle adjusting screw until there is 015 inch (gauge T109 44) opening between primary throttle valve and bore of carbureter (side opposite idle port) Lock pawl should now be in unlocked position if not adjust by bending tang on lock pawl (use bending tool T109 105) (b) Hold primary throttle valves half way open Open choke valve fully then open primary throttle valves all the way Tang on secondary throttle arm should engage in notch on lock out lever preventing secondary throttle shaft movement Keep choke valve in wide open position Close primary throttle valves so that lock pawl is unlocked then open primary throttle valves all the way Lock out lever should fall free allowing secondary throttle valves to be open before primary throttle valves are fully open If necessary bend tang on secondary throttle lever to provide clearance for proper operation of lock out lever

UNLOADER ADJUSTMENT With throttle wide open there should be 13/64 inch (gauge T109 39) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109 41)

SECONDARY THROTTLE LEVER ADJUSTMENT Primary and secondary throttle valves should reach wide open position at the same time To adjust bend throttle operating rod at upper angle (Use bending tool T109-213)

AIR CONDITIONER FAST IDLE DEVICE ADJUSTMENT This adjustment must be made after carbureter is installed on car engine at normal operating temperature and slow idle adjustment is completed With shift lever in neutral and air conditioner turned on engine should idle 900 RPM To adjust loosen lock nut on diaphragm shaft and adjust knurled nut to obtain specified RPM then tighten lock nut

IDLE SPEED AND MIXTURE ADJUSTMENT (Normal Engine Temp) In making the idle adjustment on the engine the air adjustment screw is used to adjust idle speed in a similar manner as the throttle speed screw used previously Turning the air adjustment screw outward increases engine speed but also leans the mixture supplied to the manifold which must be compensated for by adjustment of the idle mixture adjusting screws

Cadillac 8—1955—Carbureters Nos. 2185S-2186S-2255S-2266S-2267S

WHEN SERVICING, USE GASKET ASSORTMENT No 263 (2255S-2266S-2267S), REPAIR PACKAGE No. 1792 (2255S-2266S 2267S)
PART NAMES IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No.	PART NAME

WCFB Four Bore Down-Draft Climatic® Control **Carbureter No. 2143S**

CARBURETER SPECIFICATIONS

For Cadillac 8 Cylinder Engine 3-13/16 Inch Bore, 3⅝ Inch Stroke

Dimensions Flange size 1⅛ inch Four Bore—4 bolt type
Primary venturi size 11/32 inch I D
Main venturi size 1 1/16 inch I D

Float Level See adjustments

Vent Outside None
Inside balance vent tube in air horn 2 on primary side 3 on secondary side

Gasoline Intake Size No 38 (1015 inch) drill hole in needle seat

Low Speed Jet Tube Jet size No 70 (028 inch) drill
By pass (2 in low speed jet) size 0492 inch drill
Economizer in body size No 56 (0465 inch) drill
Idle bleed in body size 059 inch drill

Idle Port (Upper) slot type Primary length 140 inch width 030 inch
Secondary length 103 inch width 030 inch

Idle Port Opening Primary 091 to 097 inch secondary 067 to 073 inch above upper edge of valve with valve tightly closed

Lower Port Primary (for idle adjustment screw) size No 53 (0595 inch) drill
Secondary None

Set Idle Adjustment Screw ¾ to 1¾ turns open For richer mixture turn screw out Do not idle engine below 400 r p m (Hydra Matic In Drive range) 425 r p m (Twin Turbine In Drive range)

Main Nozzle Installed permanently DO NOT REMOVE
Anti percolating jet (secondary only) size No 70 (028 inch) drill

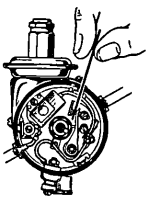
Metering Rod Economy step (75 944) 071 inch (75 889) 073 inch (75 937) 074 inch diameter Middle step tapers to (75 944 75 889) 063 inch (75 937) 065 inch diameter Power step (75 944 75 889) 054 inch (75 937) 056 inch diameter

Metering Rod Jet Primary size 0935 inch diameter (for metering rod)
Secondary size 067 inch diameter (no metering rod)

Metering Rod Setting See adjustments

Accelerating Pump Discharge jet (twin) primary only size No 74 (0225 inch) drill
Intake ball check seat size 115 to 120 inch diameter
Discharge needle seat size 070 inch diameter
Relief ball check size No 55 (052 inch) drill
Relief passage (vent) to fuel chamber No 42 (0935 inch) drill

Choke Carter Climatic® Control set on index Butterfly type, offset choke valve primary side only Choke heat suction hole restriction in piston housing size No 44 (086 inch) drill



Vacuum Spark Port Round type 127 to 129 inch diameter Top of port 060 to 070 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER
TRADE MARK RE U S PAT FF
MARCA REGISTRADA

CARBURETER ADJUSTMENTS

Float Adjustment Two separate float adjustments must be made—lateral and vertical LATERAL ADJUSTMENT With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portions of gauge fitted over edges of casting Sides of floats should just clear the vertical upright of float gauge Adjustment should be made by bend ing arms of floats VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge The vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109 232) for primary floats and 3/16 inch (gauge T109 222) for sec ondary floats Adjust by bending float arms

Float Drop Adjustment With bowl cover held in upright position and measuring from center of float the d stance be tween top of floats and bowl cover should be 5/8 inch for pri mary floats and 11/16 inch for secondary floats Adjust by bending stop tabs on float bracket

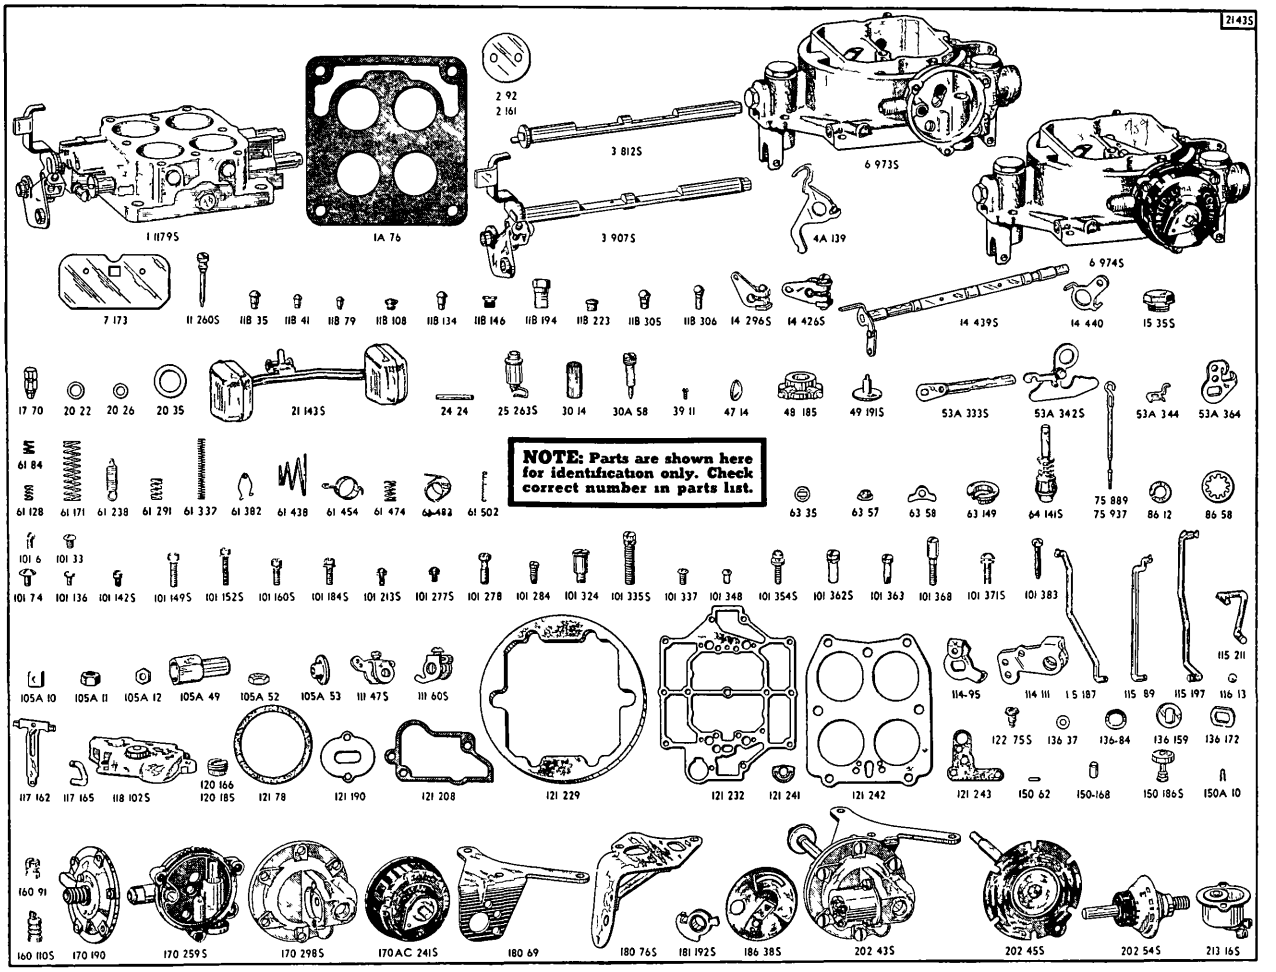
Pump Adjustment Install pump connector link in outer hole (long stroke) of pump arm with ends extending toward counter shaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109 213)

Metering Rod Adjustment Metering rod adjustment is im portant and must be made after completing the pump adjust ment No metering rod gauges are necessary Procedure is as follows 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

Bowl Vapor Vent Adjustment This adjustment should be made after completing pump and metering rod adjustments Install dust cover gasket and dust cover Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter There should be 1/16 inch (gauge T109 197) between lower edge of bowl vapor vent valve and dust cover To adjust re move dust cover and bend vapor vent arm

Choke Modifier Adjustment 1 Set Climatic® control as sembly on index 2 Loosen clamp screw 3 Remove lower end of connector rod 4 Rotate metal pointer until it is in line with raised pointer on coil housing 5 Align scribed line on lever so that it is straight up and down Hold in place and tighten clamp screw 6 Seat throttle valves (back out throttle lever set screw and hold choke valve wide open) 7 Hold pointer as indicated in No 4 Lower end of rod must slide freely into hole in throttle arm Bend rod at upper angle to adjust

Fast Idle and Secondary Throttle Lock-out Adjustment 1 Preliminary Adjustment Loosen choke lever clamp screw on choke shaft Insert 020 inch feeler gauge (T109 29) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw 2 Secondary Throttle Lock Out Adjustment (a) With choke valve tightly closed tighten fast idle adjusting screw until there is 015 inch (gauge T109 44) opening between primary throttle valve and bore of carbureter (side opposite idle port) Lock pawl should now be in unlocked position if not adjust by bending tang on lock pawl (use bending tool T109 105) (b) Hold primary throttle valves half way open Open choke valve fully then open primary throttle valves all the way Tang on secondary throttle arm should engage in notch on lock out lever preventing secondary throttle shaft movement Keep choke valve in wide open position Close primary throttle valves so that lock pawl is unlocked then open primary throttle valves all the way Lock out lever should fall free allowing secondary throttle valves to be open before pri mary throttle valves are fully open If necessary bend tang on secondary throttle lever to provide clearance for proper operation of lock out lever 3 Fast Idle Adjustment With choke valve tightly closed tighten fast idle adjusting screw until there is 020 inch (gauge T109 29) opening between throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjusting screw is on high step of cam while making this adjustment



Unloader Adjustment With throttle wide open there should be 3/16 inch (gauge T109 28) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109 41)

Secondary Throttle Lever Adjustment Primary and secondary throttle valves should reach wide open position at the same time To adjust bend throttle operating rod at upper angle (Use bending tool T109 213)

Dashpot (Slow Closing Throttle) Adjustment Maximum dash pot action is obtained by adjusting as follows With throttle valves seated loosen lock nut and adjust dashpot assembly so that plunger shaft can be moved inward approximately 005 inch

AIR CONDITIONER FAST IDLE DEVICE ADJUSTMENT

This adjustment must be made after carbureter is installed on car engine at normal operating temperature and slow idle adjustment is completed With shift lever in neutral and air conditioner turned on engine should idle at 900 r p m To adjust loosen lock nut on diaphragm shaft and adjust knurled nut to obtain specified r p m then tighten lock nut

WCFB Four Bore Down-Draft Climatic® Control Carbureters Nos. 2119S-2119SA-2088S

CARBURETER SPECIFICATIONS

For Cadillac 8 Cylinder Engine 3-13/16 Inch Bore, 3⅝ Inch Stroke

Dimensions Flange size 1⅛ inch Four Bore—4 bolt type
Primary venturi size 11/32 inch I D
Main venturi size 1 1/16 inch I D

Float Level See adjustments

Vent Outside None
Inside balance vent tube in air horn 2 on primary side 3 on secondary side

Gasoline Intake Size No 38 (1015 inch) drill hole in needle seat

Low Speed Jet Tube Jet size No 70 (028 inch) drill
By pass (2 in low speed jet) size 0492 inch diameter
Economizer size No 56 (0465 inch) drill
Idle bleed size 059 inch drill

Idle Port (Upper) slot type Primary length 140 inch width 030 inch
Secondary length 103 inch width 030 inch

Idle Port Opening Primary 091 to 097 inch secondary 067 to 073 inch above upper edge of valve with valve tightly closed

Lower Port Primary (for idle adjustment screw) size No 53 (0595 inch) drill
Secondary None

Set Idle Adjustment Screw ¾ to 1¾ turns open For richer mixture turn screw out Do not idle engine below 425 r p m (Transmission in Drive range)

Main Nozzle Installed permanently **DO NOT REMOVE**
Anti percolating jet (secondary only) size No 70 (028 inch) drill

Metering Rod Primary economy step 074 inch diameter
Middle step tapers to 065 inch diameter
Power step 056 inch diameter
Secondary None

Metering Rod Jet Primary size 0935 inch diameter (for metering rod)
Secondary size 067 inch diameter (no metering rod)

Metering Rod Setting See adjustments

Accelerating Pump Discharge jet (twin) primary only size No 74 (0225 inch) drill
Intake ball check seat size 115 to 120 inch diameter
Discharge needle seat size 070 inch diameter
Relief ball check size No 55 (052 inch) drill
Relief passage (vent) to fuel chamber No 42 (0935 inch) drill

Choke Carter Climatic® Control set on index Butterfly type offset choke valve primary side only Choke heat suction hole restriction in piston housing size No 44 (086 inch) drill

Vacuum Spark Port Round type 127 to 129 inch diameter
Top of port 060 to 070 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open	Float Setting	Idle Adjustment Screw Setting

CARBURETER ADJUSTMENTS

Fl at Adjustment Two separate float adjustments must be made—lateral and vertical LATERAL ADJUSTMENT With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portions of gauge fitted over edges of casting Sides of floats should just clear the vertical upright of float gauge Adjustment should be made by bending arms of floats VERTICAL ADJUSTMENT With float gauge in same pos tion floats should just clear the horizontal portion of gauge The vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109 232) for primary floats and 3/16 inch (gauge T109 222) for secondary floats Adjust by bending float arms

Float Drop Adjustment With bowl cover held in upright position and measuring from center of float the distance be tween top of floats and bowl cover should be 5/8 inch for pri mary floats and 11/16 inch for secondary floats Adjust by bending stop tabs on float bracket

Pump Adjustment Install pump connector link in outer hole (long stroke) of pump arm with ends extending toward counter shaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109 213)

Metering Rod Adjustment Metering rod adjustment is im portant and must be made after completing the pump ad justment No metering rod gauges are necessary Procedure is as follows 1 Back out throttle lever set screw to allow throt tle valves to seat in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throt tle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

Bowl Vapor Vent Adjustment This adjustment should be made after completing pump and metering rod adjustments Install dust cover gasket and dust cover Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter There should be 1/16 inch (gauge T109 197) between lower edge of bowl vapor vent valve and dust cover To adjust re move dust cover and bend vapor vent arm

Choke Modifier Adjustment 1 Set Climatic® control as sembly on index 2 Loosen clamp screw 3 Remove lower end of connector rod 4 Rotate metal pointer until it is in line with raised pointer on coil housing 5 Align scribed l ne on lever so that it is straight up and down Hold in place and tighten clamp screw 6 Seat throttle valves (back out throttle lever set screw and hold choke valve wide open) 7 Hold pointer as indicated in No 4 Lower end of rod must slide freely into hole in throttle arm Bend rod at upper angle to adjust

Fast Idle and Secondary Throttle Lock out Adjustment 1 Preliminary Adjustment Loosen choke lever clamp screw on choke shaft Insert 020 inch feeler gauge (T109 29) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw 2 Secondary Throttle Lock Out Adjustment (a) With choke valve tightly closed tighten fast idle adjusting screw until there is 015 inch (gauge T109 44) opening between primary throttle valve and bore of carbureter (side opposite idle port) Lock pawl should now be in unlocked position if not adjust by bending tang on lock pawl (use bending tool T109 105) (b) Hold primary throttle valves half way open Open choke valve fully then open primary throttle valves all the way Tang on secondary throttle arm should engage in notch on lock out lever preventing secondary throttle shaft movement Keep choke valve in wide open position Close pr mary throttle valves so that lock pawl is unlocked then open primary throttle valves all the way Lock out lever should fall free allowing secondary throttle valves to be open before primary throttle valves are fully open If necessary bend tang on secondary throttle lever to provide clearance for proper operation of lock out lever 3 Fast Idle Adjustment With choke valve tightly closed tighten fast idle adjusting screw until there is 020 inch (gauge T109 29) opening between throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjusting screw is on high step of cam while making this adjustment

Unloader Adjustment With throttle wide open there should be 3/16 inch (gauge T109 28) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending un loader lip on throttle shaft lever (use bending tool T109 41)

Secondary Throttle Lever Adjustment Primary and secondary throttle valves should reach wide open posit on at the same time To adjust bend throttle operating rod at upper angle (Use bending tool T109 213)

Dashpot (Slow Closing Throttle) Adjustment Maximum dash pot action is obtained by adjusting as follows (2119S) with throttle valve seated adjust diaphragm adjusting screw so that the dash pot plunger shaft can be moved inward approximately 3/32 inch (2119SA 2088S) With throttle valves seated loosen lock nut and adjust dashpot assembly so that plunger shaft can be moved inward approximately 005 inch

AIR CONDITIONER FAST IDLE DEVICE ADJUSTMENT

This adjustment must be made after carbureter is installed on car engine at normal operating temperature and slow idle adjustment is completed With shift lever in neutral and air conditioner turned on engine should idle between 750 and 800 r p m To adjust loosen lock nut on diaphragm shaft and adjust knurled nut to obtain specified r p m then tighten lock nut

WCFB Four Bore Down-Draft Climatic® Control **Carbs. Nos. 2005S-2005SA-2072S**

CARBURETER SPECIFICATIONS

For Cadillac 8 Cylinder Engine: 3-13/16 Inch Bore, 3⅝ Inch Stroke

Dimensions: Flange size, 1⅛ inch Four Bore—4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi size, 1-1/16 inch I. D.

Float Level: See adjustments.

Vent: Outside, None.
Inside, balance vent tube in air horn, 2 on primary side, 3 on secondary side.

Gasoline Intake: Size No. 38 (.1015 inch) drill hole in needle seat.

Low Speed Jet Tube: Jet, size No. 70 (.028 inch) drill.
By-pass (2 in low speed jet), size No. 56 (.0465 inch) drill.
Economizer, size No. 56 (.0465 inch) drill.
Idle bleed, size .059 inch drill.

Idle Port: (Upper) slot type. Primary, length .140 inch; width .030 inch.
Secondary, length .103 inch; width .030 inch.

Idle Port Opening: Primary, .091 to .097 inch, secondary, .067 to .073 inch above upper edge of valve with valve tightly closed.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill.
Secondary, None.

Set Idle Adjustment Screw: 1¼ to 2¼ turns open. For richer mixture turn screw out. Do not idle engine below 400 r.p.m. (Transmission in Drive range).

Main Nozzle: Installed permanently. **DO NOT REMOVE.** Anti-percolating jet (secondary only), size No. 70 (.028 inch) drill.

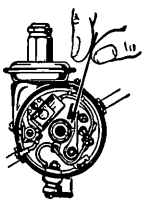
Metering Rod: Primary, economy step .073 inch diameter.
Middle step tapers to .063 inch diameter.
Power step, .054 inch diameter.
Secondary, None.

Metering Rod Jet: Primary, size .0935 inch diameter (for metering rod).
Secondary, size .067 inch diameter (no metering rod).

Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) primary only, size No. 74 (.0225 inch) drill.
Intake ball check seat, size .115 to .120 inch diameter.
Discharge needle seat, size .070 inch diameter.
Relief ball check, size No. 55 (.052 inch) drill.
Relief passage (vent) to fuel chamber No. 42 (.0935 inch) drill.

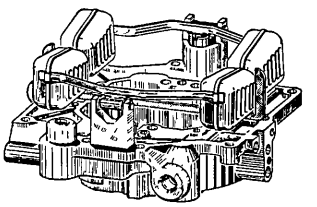
Choke: Carter Climatic ® Control, set on index. Butterfly type, offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 44 (.086 inch) drill.



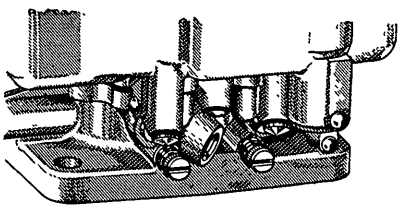
Vacuum Spark Port: Round type, .127 to .129 inch diameter. Top of port .060 to .070 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .033"-.038"



Breaker Point Setting .0125"-.0175"

Ignition Timing Breaker Points to Open: 2½° B.T.C. Distance C to A (Distributor vacuum line disconnected)

Float Setting Primary ⅛ Inch (Use Gauge T109-232) Secondary 3/16 Inch (Use Gauge T109-222)

Idle Adjustment Screw Setting 1¼ to 2¼ Turns Open

NOTE: These cars are equipped with hydraulic valve lifters.—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

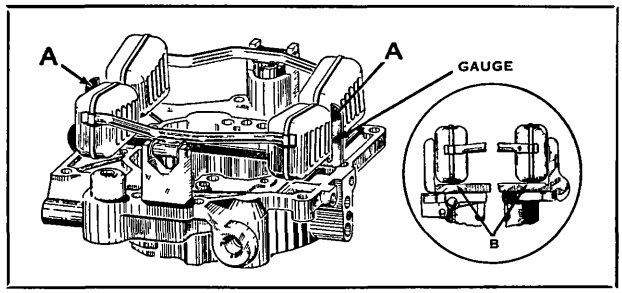

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig 1)

Two separate float adjustments must be made—lateral and vertical LATERAL ADJUSTMENT With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portions of gauge fitted over edges of casting Sides of floats should just clear the vertical upright of float gauge (A) Adjustment should be made by bending arms of floats VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge The vertical distance (B) between top of float and machined surface of casting must be 1/8 inch (gauge T109 232) for primary floats and 3/16 inch (gauge T109 222) for secondary floats Adjust by bending float arms

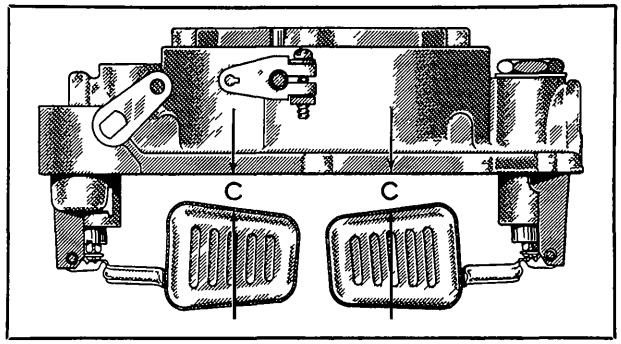

Figure 2
Float Drop Adjustment

FLOAT DROP ADJUSTMENT (Fig 2)

With bowl cover held in upright position and measuring from center of float (C) the distance between top of floats and bowl cover should be 5/8 inch for primary floats and 11/16 inch for secondary floats Adjust by bending stop tabs on float bracket

PUMP ADJUSTMENT (Fig 3)

Install pump connector link in outer hole (long stroke) of pump arm (D) with ends extending toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (E) (Use tool T109 213)

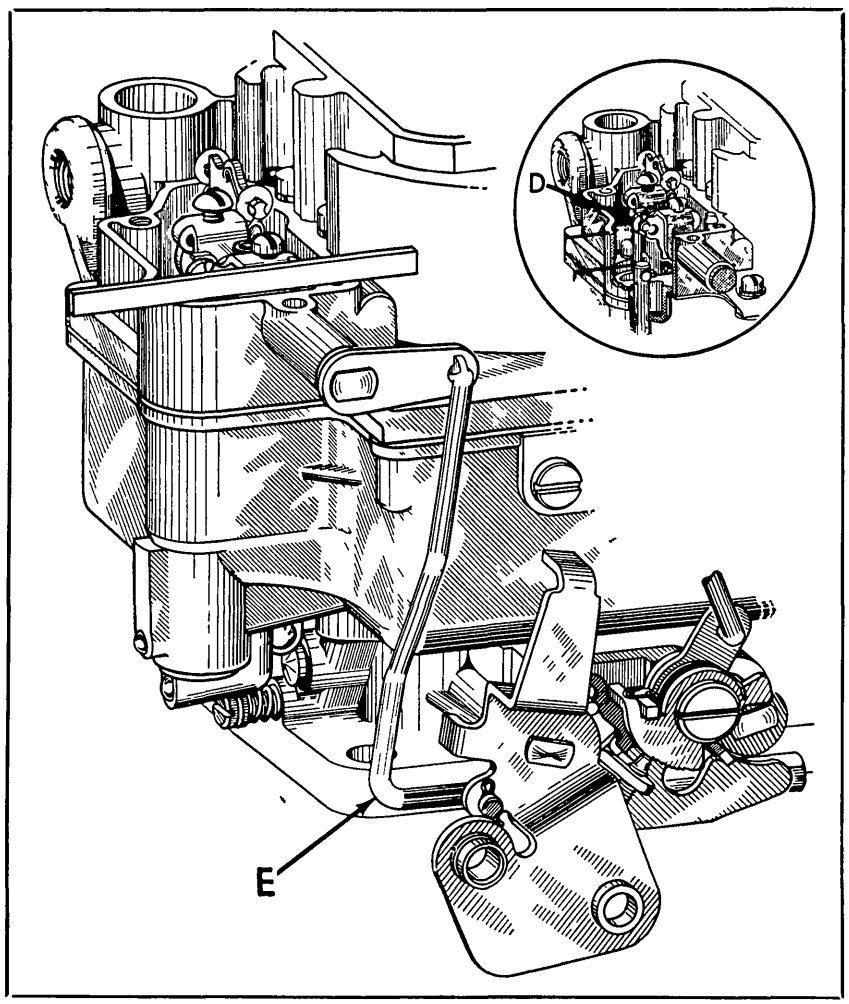

Figure 3
Pump Adjustment

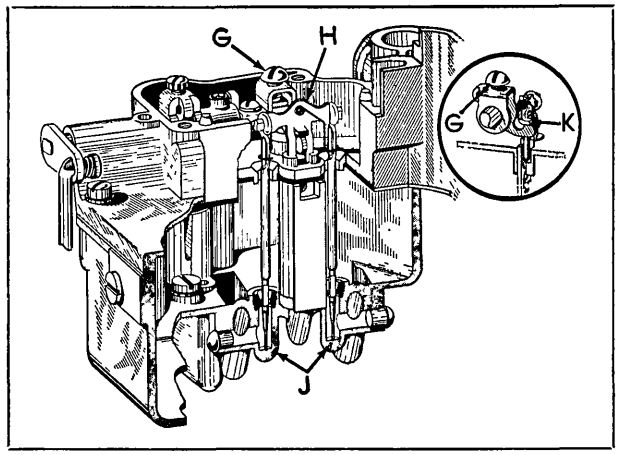

Figure 4
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 4):

Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (G). 2. With metering rods in place, press down on vacumeter link (H) until metering rods bottom in carbureter body casting (J). 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link (K). Hold in place and carefully tighten clamp screw (G).

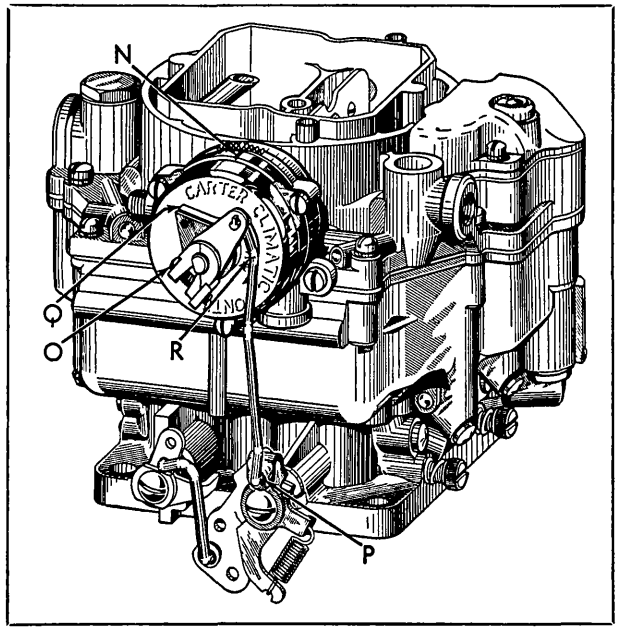

Figure 6
Choke Modifier Adjustment

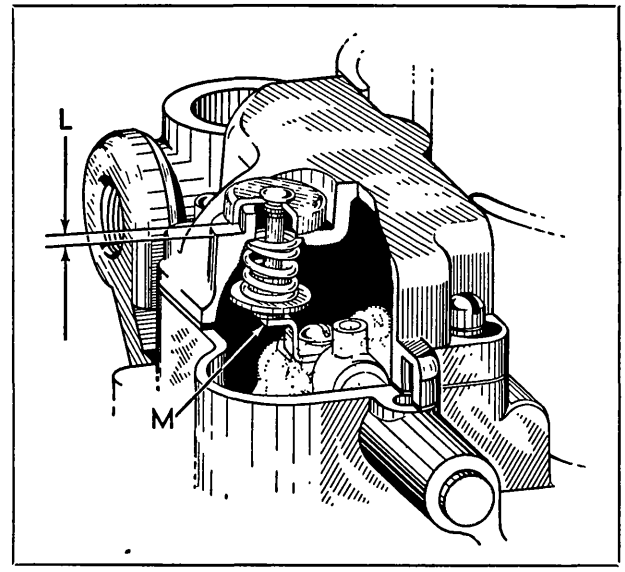

Figure 5
Bowl Vapor Vent Adjustment

BOWL VAPOR VENT ADJUSTMENT (Fig. 5):

This adjustment should be made after completing pump and metering rod adjustments. Install dust cover gasket and dust cover. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (L) (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm (M).

CHOKE MODIFIER ADJUSTMENT (Fig. 6):

1. set Climatic® control assembly on index (N). 2. Loosen clamp screw (O). 3. Remove lower end of connector rod (P). 4. Rotate metal pointer until it is in line with raised pointer on coil housing (Q). 5. Align scribed line on lever so that it is straight up and down. Hold in place and tighten clamp screw (O). 6. Seat throttle valves (back out throttle lever set screw and hold choke valve wide open). 7. Hold pointer as indicated in No. 4. Lower end of rod (P) must slide freely into hole in throttle arm. Bend rod at upper angle (R) to adjust.

FAST IDLE AND SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 7):

1. Preliminary Adjustment: Loosen choke lever clamp screw (AA) on choke shaft. Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting (BB). Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (AA). 2. Secondary Throttle Lock-Out Adjustment: (a) With choke valve tightly closed, tighten fast idle adjusting screw (CC) until there is .015 inch (gauge T109-44) opening between primary throttle valve and bore of carbureter (side opposite idle port) (DD). Lock pawl (EE) should now be in unlocked position; if not, adjust by bending tang (FF) on lock pawl (use bending tool T109-105). (b) Hold primary throttle valves half way open. Open choke valve fully, then open primary throttle valves all the way. Tang (GG) on secondary throttle arm should engage in notch (HH) on lock out lever preventing secondary throttle shaft movement. Keep choke valve in wide open position. Close primary throttle valves so that lock pawl (EE) is unlocked, then open primary throttle valves all the way. Lock-out lever (JJ) should fall free allowing secondary throttle valves to be open before primary throttle valves are fully open. If necessary, bend tang (GG) on secondary throttle lever to provide clearance for proper operation of lock-out lever. 3. Fast Idle Adjustment: With choke valve tightly closed, tighten fast idle adjusting screw (CC) until there is .020 inch (gauge T109-29) opening between throttle valve and bore of carbureter (side opposite idle port) (DD). Be sure fast idle adjusting screw (CC) is on high step of cam while making this adjustment.

*These parts must be used on 2005S and 2072S with cast iron flange

†These parts must be used on 2005S and 2072S with aluminum flange

NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown only one is used

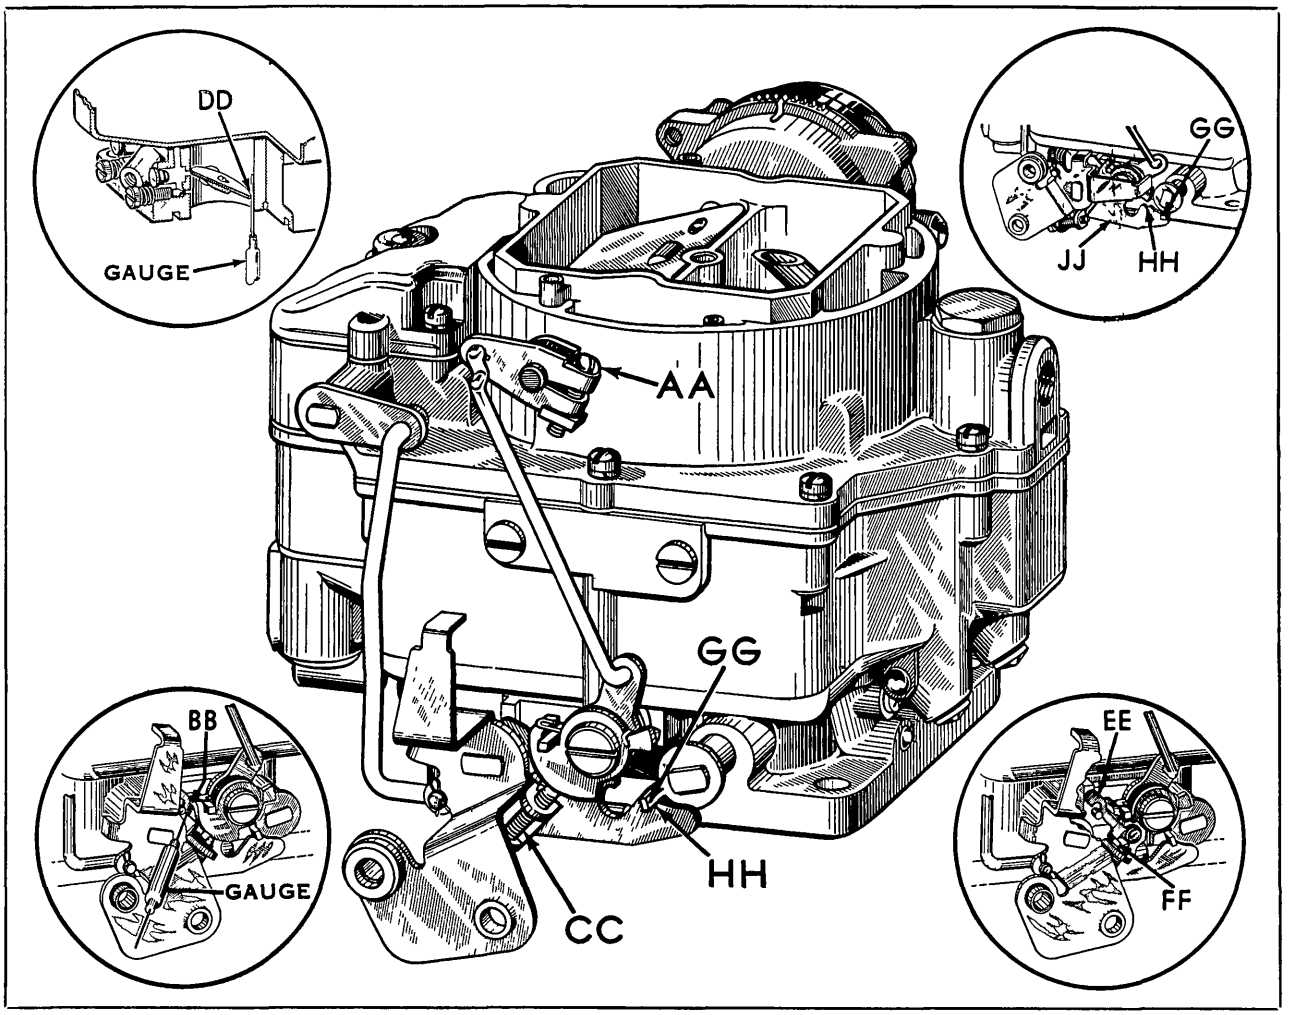

Figure 7
Fast Idle and Secondary Throttle Lock-Out Adjustment

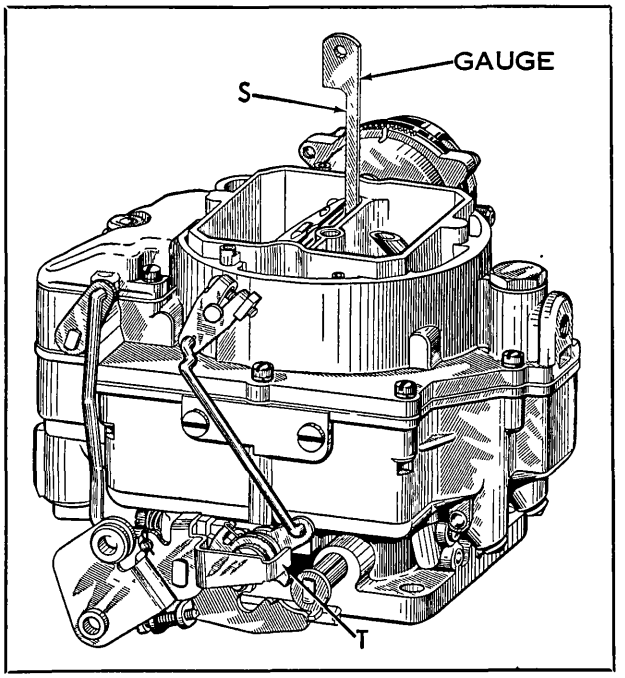

Figure 8
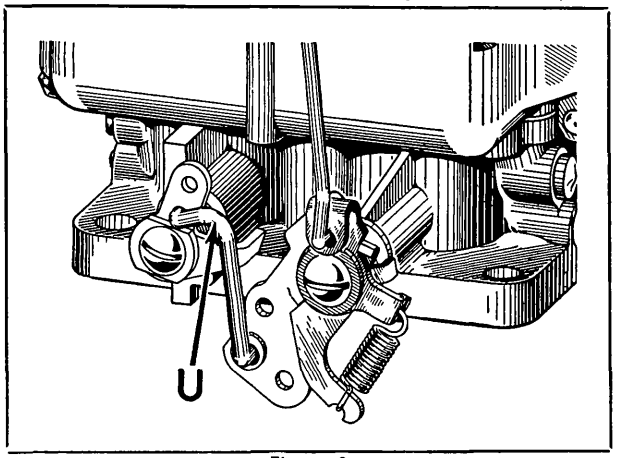
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 8):
With throttle wide open there should be 3/16 inch (gauge T109-28) clearance (S) between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip (T) on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LEVER ADJUSTMENT (Fig. 9):
Primary and secondary throttle valves should reach wide open position at the same time. To adjust bend throttle operating rod at upper angle (U). (Use bending tool T109-213.)



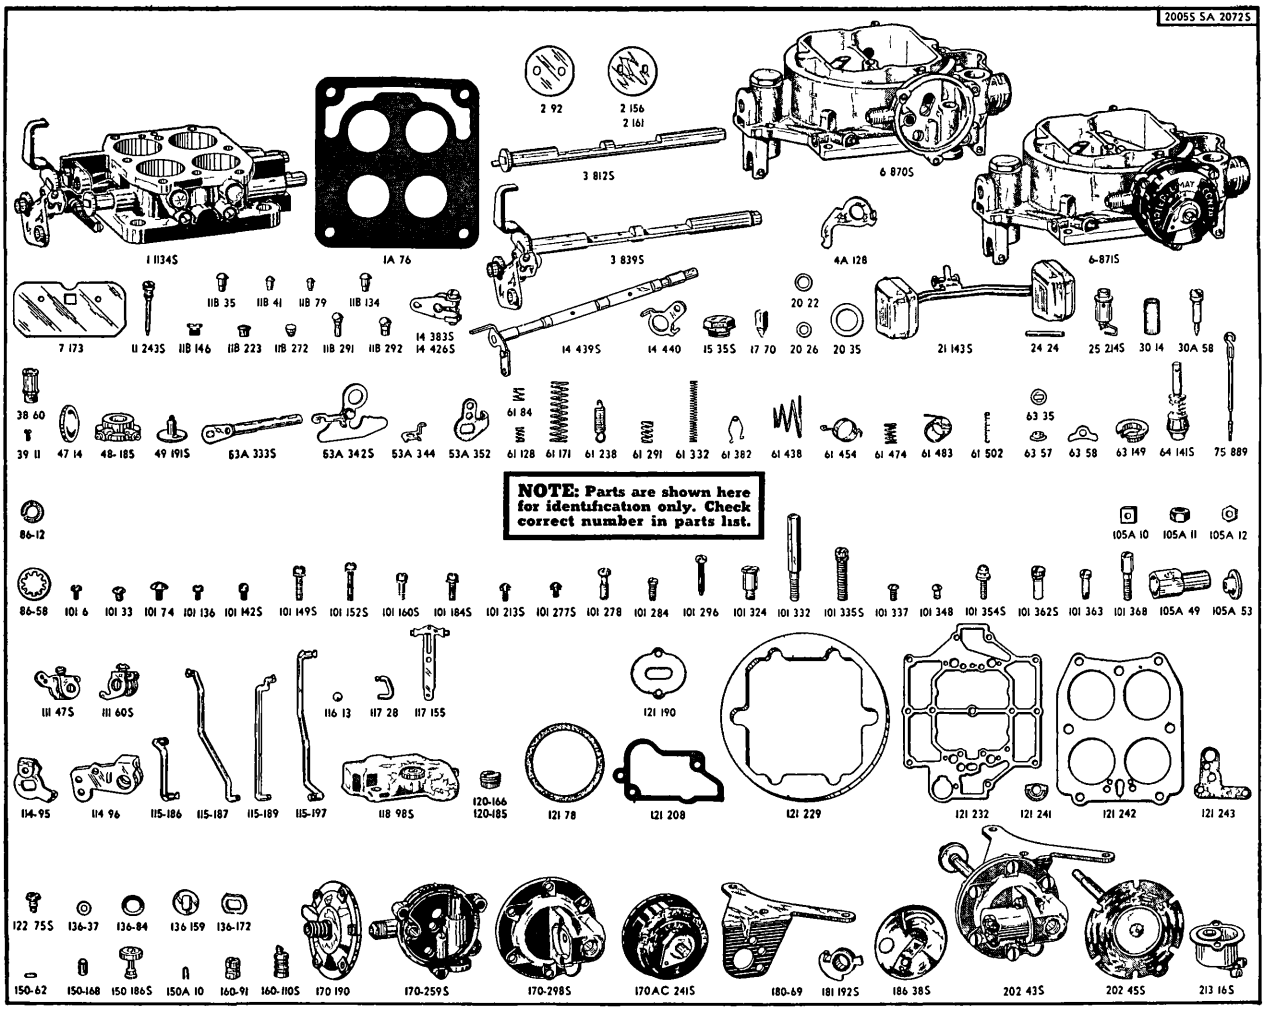


Figure 9
Secondary Throttle Lever Adjustment

AIR CONDITIONER FAST IDLE DEVICE ADJUSTMENT (Not Illustrated):
This adjustment must be made after carbureter is installed on car, engine at normal operating temperature and slow idle adjustment is completed. With shift lever in neutral and air conditioner turned on, engine should idle between 750 and 800 r.p.m. To adjust, loosen lock nut on diaphragm shaft and adjust knurled nut to obtain specified r.p.m., then tighten lock nut.

Use 2143S and 202-44U to replace 2110S)

WCFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2109S-2110S**

CARBURETER SPECIFICATIONS

For Cadillac 8 Cylinder Engine: 3-13/16 Inch Bore, 3⅝ Inch Stroke

Dimensions: Flange size 1⅛ inch Four Bore—4 bolt type.
Primary venturi size 11/32 inch I. D.
Main venturi size, 1-1/16 inch I. D.

Float Level: See adjustments.

Vent: Outside, None.
Inside, balance vent tube in air horn, 2 on primary side, 3 on secondary side.

Gasoline Intake: Size No. 38 (.1015 inch) drill hole in needle seat.

Low Speed Jet Tube: Jet, size No. 70 (.028 inch) drill.
By-pass (2 in low speed jet), size .0492 inch drill.
Economizer, in body, size No. 56 (.0465 inch) drill.
Idle bleed, in body, size .059 inch drill.

Idle Port: (Upper) slot type. Primary, length .140 inch; width .030 inch.
Secondary, length .103 inch; width .030 inch.

Idle Port Opening: Primary, .091 to .097 inch, secondary, .067 to .073 inch above upper edge of valve with valve tightly closed.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill.
Secondary, None.

Set Idle Adjustment Screw: ¾ to 1¾ turns open. For richer mixture turn screw out. Do not idle engine below 400 r.p.m. (Transmission in Drive range).

Main Nozzle: Installed permanently. DO NOT REMOVE.
Anti-percolating jet (secondary only), size No. 70 (.028 inch) drill.

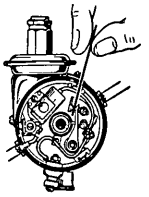
Metering Rod: Primary, economy step .073 inch diameter.
Middle step tapers to .063 inch diameter.
Power step, .054 inch diameter.
Secondary, None.

Metering Rod Jet: Primary, size .0935 inch diameter (for metering rod).
Secondary, size .067 inch diameter (no metering rod).

Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) primary only, size No. 74 (.0225 inch) drill.
Intake ball check seat, size .115 to .120 inch diameter.
Discharge needle seat, size .070 inch diameter.
Relief ball check, size No. 55 (.052 inch) drill.
Relief passage (vent) to fuel chamber No. 42 (.0935 inch) drill.

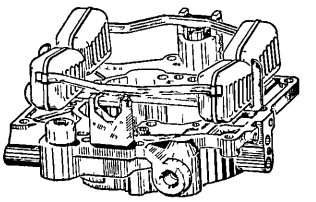
Choke: Carter Climatic® Control, set on index. Butterfly type, offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 44 (.086 inch) drill.



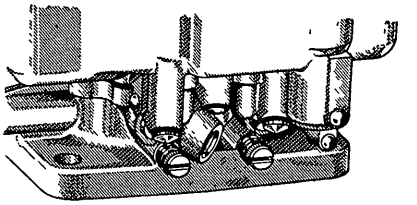
Vacuum Spark Port: Round type, .127 to .129 inch diameter. Top of port .060 to .070 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting 0125"-.0175"

Ignition Timing Breaker Points to Open: 2½° B.T.C. ½ Distance C to A Distributor vacuum line disconnected

Float Setting Primary ⅛ Inch (Use Gauge T109-232) Secondary 3/16 Inch (Use Gauge T109-222)

Idle Adjustment Screw Setting ¾ to 1¾ Turns Open

NOTE: These cars are equipped with hydraulic valve lifters.—NO ADJUSTMENT.

MARCA REGISTRADA

S. S PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vertical LATERAL ADJUSTMENT With bowl cover assembly inverted bowl cover gasket removed and float lip resting on seated needle place float gauge directly under center of floats with notched portions of gauge fitted over edges of casting Sides of floats should just clear the vertical upright of float gauge Adjustment should be made by bending arms of floats VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge The vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109 232) for primary floats and 3/16 inch (gauge T109 222) for secondary floats Adjust by bending float arms

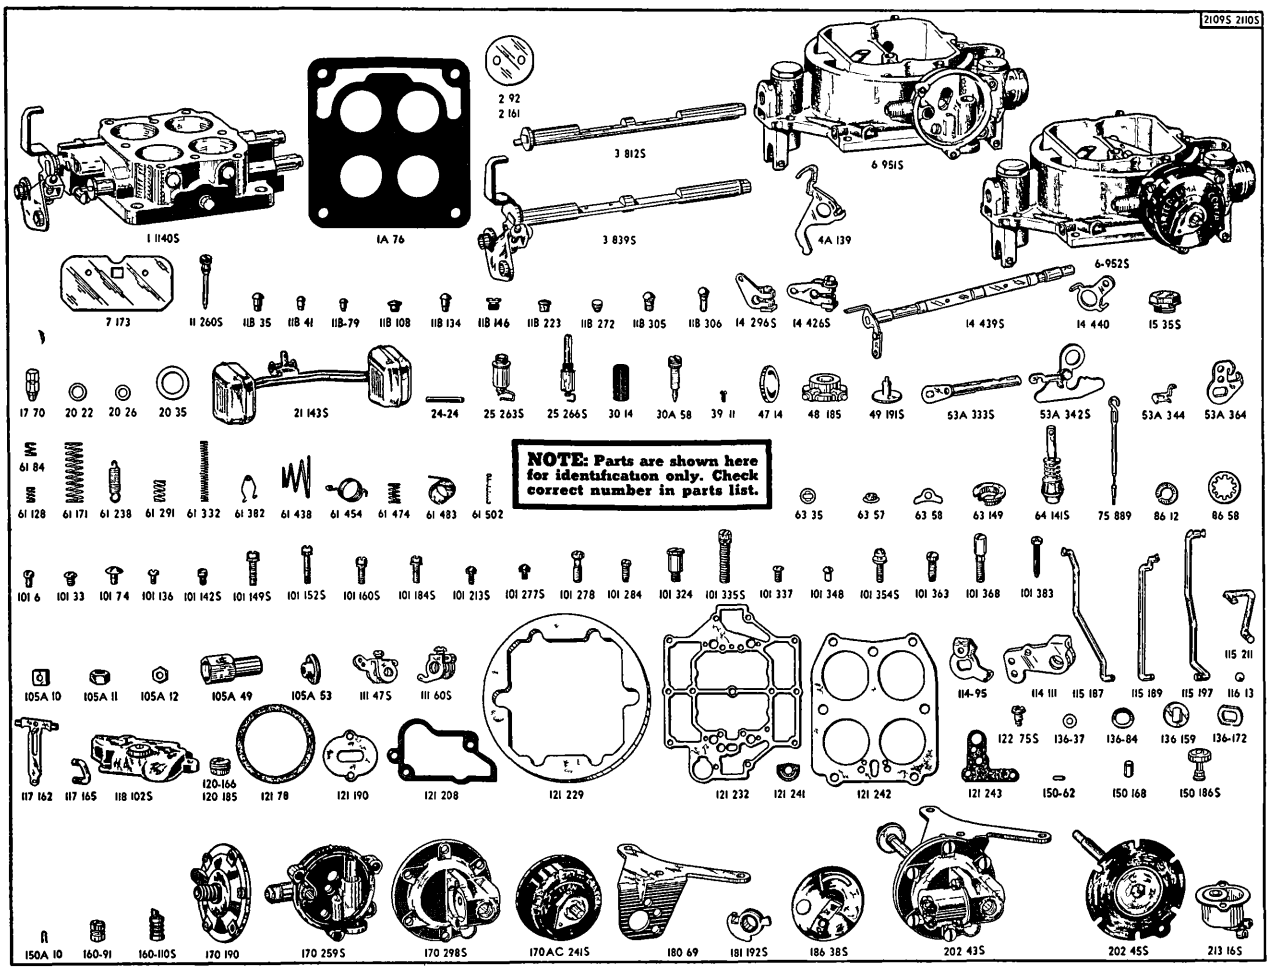
FLOAT DROP ADJUSTMENT With bowl cover held in upright position and measuring from center of float the distance between top of floats and bowl cover should be 5/8 inch for primary floats and 11/16 inch for secondary floats Adjust by bending stop tabs on float bracket

PUMP ADJUSTMENT Install pump connector link in outer hole (long stroke) of pump arm with ends extending toward counter shaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109 213)

METERING ROD ADJUSTMENT Metering rod adjustment is important and must be made after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

BOWL VAPOR VENT ADJUSTMENT This adjustment should be made after completing pump and metering rod adjustments Install dust cover gasket and dust cover Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter There should be 1/16 inch (gauge T109 197) between lower edge of bowl vapor vent valve and dust cover To adjust remove dust cover and bend vapor vent arm

CHOKE MODIFIER ADJUSTMENT 1 Set Climatic® control assembly on index 2 Loosen clamp screw 3 Remove lower end of connector rod 4 Rotate metal pointer until it is in line with raised pointer on coil housing 5 Align scribed line on lever so that it is straight up and down Hold in place and tighten clamp screw 6 Seat throttle valves (back out throttle lever set screw and hold choke valve wide open) 7 Hold pointer as indicated in No 4 Lower end of rod must slide freely into hole in throttle arm Bend rod at upper angle to adjust



FAST IDLE AND SECONDARY THROTTLE LOCK OUT ADJUSTMENT 1 Preliminary Adjustment Loosen choke lever clamp screw on choke shaft Insert 020 inch feeler gauge (T109 29) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw 2 Secondary Throttle Lock Out Adjustment (a) With choke valve tightly closed tighten fast idle adjusting screw until there is 015 inch (gauge T109 44) opening between primary throttle valve and bore of carbureter (side opposite idle port) Lock pawl should now be in unlocked position if not adjust by bending tang on lock pawl (use bending tool T109 105) (b) Hold primary throttle valves half way open Open choke valve fully then open primary throttle valves all the way Tang on secondary throttle arm should engage in notch on lock out lever preventing secondary throttle shaft movement Keep choke valve in wide open position Close primary throttle valves so that lock pawl is unlocked then open primary throttle valves all the way Lock out lever should fall free allowing secondary throttle valves to be open before primary throttle valves are fully open If necessary bend tang on secondary throttle lever to provide clearance for proper operation of lock out lever 3 Fast Idle Adjustment With choke valve tightly closed tighten fast idle adjusting screw until there is 020 inch (gauge T109 29) opening between throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjusting screw is on high step of cam while making this adjustment

UNLOADER ADJUSTMENT With throttle wide open there should be 3/16 inch (gauge T109 28) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109 41)

SECONDARY THROTTLE LEVER ADJUSTMENT Primary and secondary throttle valves should reach wide open position at the same time To adjust bend throttle operating rod at upper angle (Use bending tool T109 213)

AIR CONDITIONER FAST IDLE DEVICE ADJUSTMENT (2110S ONLY)

This adjustment must be made after carbureter is installed on car engine at normal operating temperature and slow idle adjustment is completed With shift lever in neutral and air conditioner turned on engine should idle 900 r p m To adjust loosen lock nut on diaphragm shaft and adjust knurled nut to obtain specified r p m then tighten lock nut

NOTE **Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown, only one is used**

ALL MODELS

CADILLAC EIGHT 1952

(2143S can also be used)

WCFB Four Bore Down-Draft Climatic® Control Carbureter **No. 896S**

CARBURETER SPECIFICATIONS

For Cadillac 8 Cylinder Engine: 3-13/16 Inch Bore, 3⅝ Inch Stroke

Dimensions: Flange size, 1⅛ inch Four Bore—4 bolt type
Primary venturi size 11/32 inch I. D.
Main venturi size: 1-1/16 inch I D.

Float Level: See adjustments

Vents: Outside, None. Inside, balance vent tube, in air horn, (secondary side) ahead of choke valve.

Gasoline Intake: Size No 42 (.0935 inch) drill hole in needle seat

Low Speed Jet Tube: Jet, size No. 70 (.028 inch) drill
By-pass, size No 54 (.055 inch) drill
Economizer, size No 57 (043 inch) drill
Idle bleed, size No 54 (055 inch) drill.

Idle Port: (Upper) Slot type. Primary, length .140 inch, width 030 inch Secondary, length 103 inch, width 030 inch.

Idle Port Opening: Top of port (aluminum flange) primary 084 to 090 inch, secondary 062 to 068 inch, (cast iron flange) primary 091 to 097 inch, secondary 067 to 073 inch above upper edge of valve with valve tightly closed

Lower Port: Primary (For Idle Adjustment Screw) (Early Production) Size No 55 (052 inch) drill, (Late Production) Size No. 53 (0595 inch) drill Secondary (None)

Set Idle Adjustment Screw: 1¼ to 2 turns open. For richer mixture turn screw out Do not idle engine below 380 R P.M with shift lever in drive position.

Main Nozzle: Installed permanently **Do not remove.**
Anti-percolating jet: (Off idle well) Size No. 75 (021 inch) drill.

Metering Rod: Primary, economy step .066 inch diameter.
Power step, .052 inch diameter.
(These rods designed with stabilizing flat on economy step)
Secondary, none.

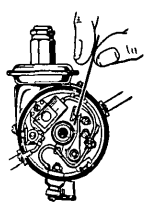
Metering Rod Jet: Primary size 0935 inch diameter (for metering rod).
Secondary, size 073 inch diameter (no metering rod).

Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) primary only size No 74 (.0225 inch) drill.
Intake ball check seat size .115 to 120 inch diameter
Discharge needle seat size 070 inch diameter.

Pump Adjustment. See adjustments.

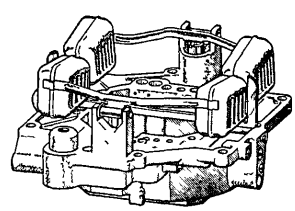
Choke: Carter Climatic ® Control, set one notch lean Butterfly type offset choke valve, primary side only Choke heat suction hole, restriction in piston housing, size No 44 (086 inch) drill



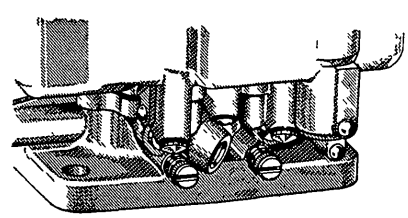
Vacuum Spark Port: (Aluminum flange) Horizontal slot (round end) 045 x 110 inch Top of port 033 to 043 inch above upper edge of valve with valve tightly closed
(Cast iron flange) Round type, 127 to 129 inch diameter Top of port 060 to 070 inch above upper edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting 0125"-.0175"

Ignition Timing Breaker Points to Open. 5° B.T.C. at "A" Mark
(Distributor vacuum line disconnected)

Float Setting (Use Gauges) See Adjustments

Idle Adjustment Screw Setting 1¼ to 2 Turns Open

NOTE: These cars are equipped with hydraulic valve lifters.—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

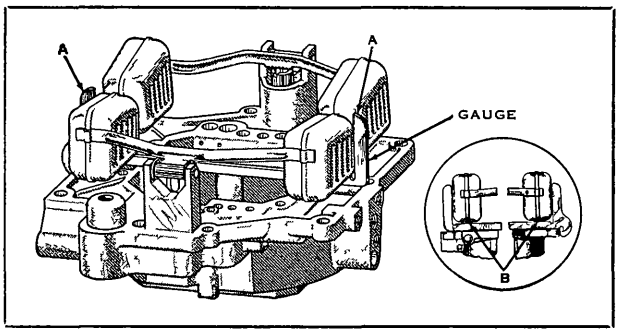

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1).

Two separate float adjustments must be made—lateral and vertical

Lateral Adjustment With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portions of gauge fitted over edges of casting Sides of floats should just clear the vertical uprights of float gauge (A) Adjustment should be made by bending arms of floats

Vertical Adjustment: (Late Production—with brass identification tags stamped "G2" and later, and having vertical ribbed floats) With float gauge in same position, floats should just clear the horizontal portion of gauge The vertical distance (B) between top of float and machined surface of casting must be ⅛ inch for primary floats (gauge T109-232), and 3/16 inch for secondary floats (gauge T109-222), (Early Production—prior to "G2" stamped on brass identification tag) The vertical distance (B) between top of float and machined surface of easting must be ¼ inch for primary floats (gauge T109-223), and 5/16 inch for secondary floats (gauge T109-220) Adjust by bending float arms

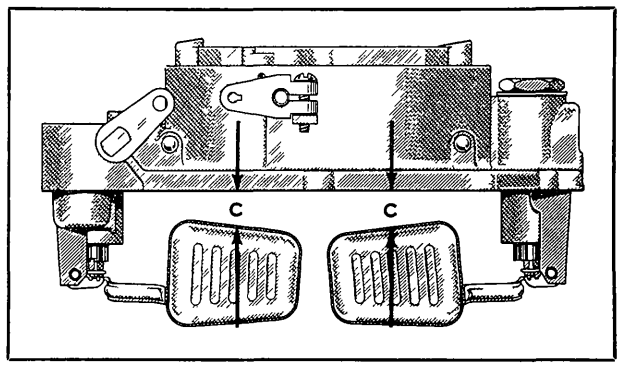

Figure 2
Float Drop Adjustment

FLOAT DROP ADJUSTMENT (Fig 2)

With bowl cover held in upright position and measuring from center of float, the distance (C) between top of floats and bowl cover should be (EARLY PRODUCTION) ¾ inch for primary floats, 13/16 inch for secondary floats, (LATE PRODUCTION—vertical ribbed floats) ⅝ inch for primary floats and 11/16 inch for secondary floats Adjust by bending stop tabs on float brackets

PUMP ADJUSTMENT (Fig. 3)

Install pump connector link in outer hole (long stroke) of pump arm (D), with ends extending toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (E) (Use tool T109-213)

Optional Adjustment. With throttle valves seated in bores of carbureter, the distance from top of the plunger shaft to the top of the dust cover boss should be 9/32" (F) Adjust as mentioned above

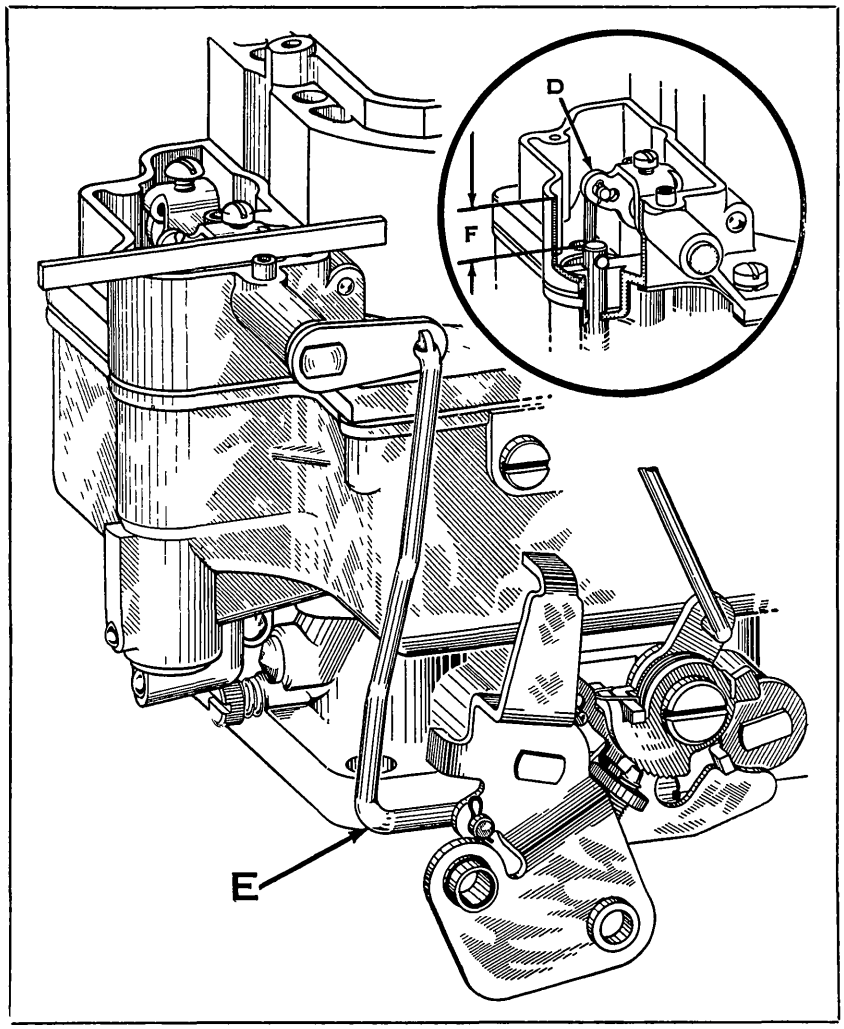

Figure 3
Pump Adjustment

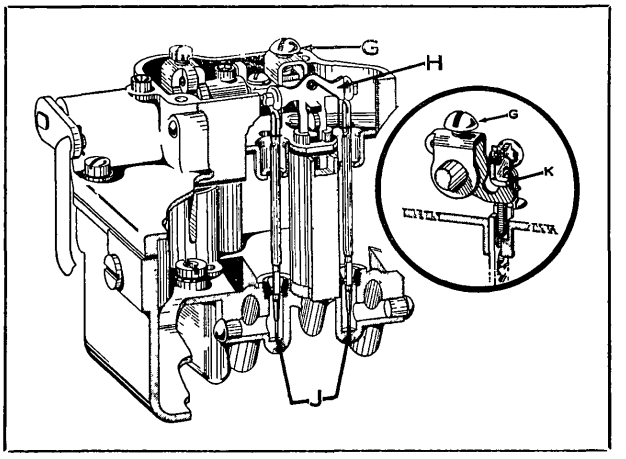

Figure 4
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 4):

Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (G). 2. With metering rods in place, press down on vacumeter link (H) until metering rods bottom in carbureter body casting (J). 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link (K). Hold in place and carefully tighten clamp screw (G)

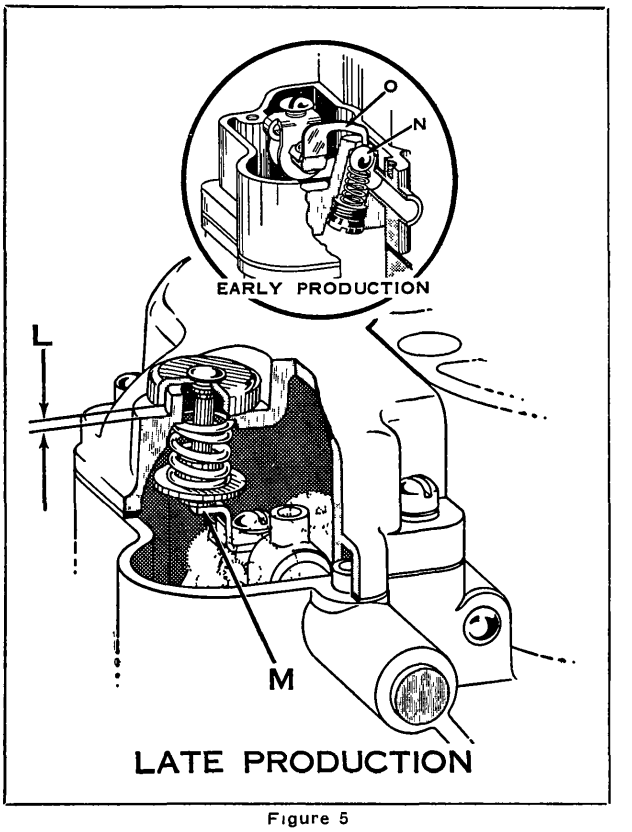

Figure 5
Bowl Vapor Vent Adjustment

*BOWL VAPOR VENT ADJUSTMENT (Fig. 5)

(LATE PRODUCTION) This adjustment should be made after completing pump and metering rod adjustments. Install dust cover gasket and dust cover. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (L) (gauge T109-197) between lower ledge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm (M).

(EARLY PRODUCTION) Place (.040") gauge T109-193 between the lower edge of throttle valve and bore of carbureter. Vapor relief arm should just contact ball (N) If necessary adjust by bending vapor vent arm (O)

*A limited number of these carbureters were built without the Bowl Vapor Vent on which no adjustment is necessary

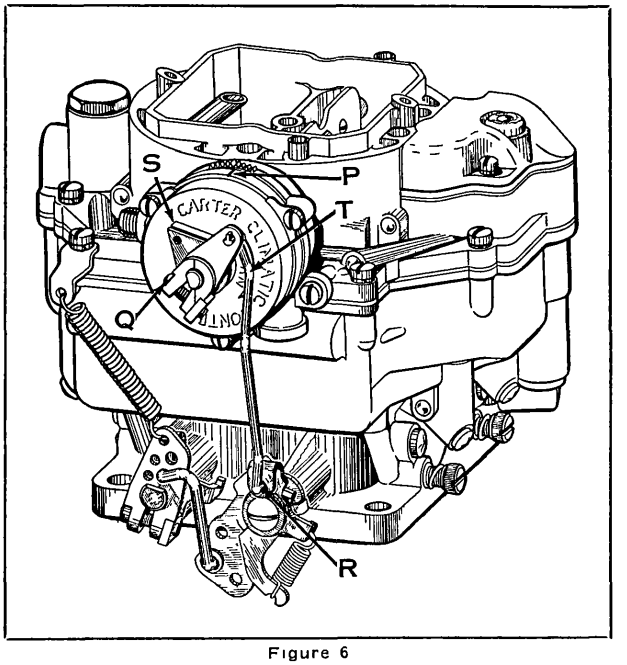

Figure 6
Choke Modifier Adjustment

CHOKE MODIFIER ADJUSTMENT (Fig. 6):

1 Set Climatic ® control assembly one point lean (P) 2 Loosen clamp screw (Q). 3. Remove lower end of connector rod (R) 4. Rotate metal pointer until it is in line with raised pointer on coil housing (S). 5. Align scribed line on lever so that it is straight up and down. Hold in place and tighten clamp screw (Q). 6. Seat throttle valves (back out throttle lever set screw and hold choke valve wide open). 7. Hold pointer as indicated in No. 4. Lower end of rod (R) must slide freely into hole in throttle arm Bend rod at upper angle (T) to adjust

FAST IDLE AND SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 7):

1. Preliminary Adjustment: Loosen choke lever clamp screw (AA) on choke shaft. Insert .020" feeler gauge T109-29 between lip of fast idle cam and boss of flange casting (BB). Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (AA). 2. Secondary Throttle Lock-Out Adjustment: (a) With choke valve tightly closed, tighten fast idle adjusting screw (CC) until there is .015" opening between primary throttle valve and bore of carbureter (side opposite idle port) (DD) Use gauge T109-44. Lock pawl (EE) should now be in unlocked position; if not, adjust by bending tang (FF) on lock pawl (use bending tool T109-105). (b) Hold primary throttle valves half way open. Open choke valve fully then open primary throttle valves all the way. Tang (GG) on secondary throttle arm should engage in notch (HH) on lock-out lever preventing secondary throttle shaft movement. Keep choke valve in wide open position. Close primary throttle valves so that lock pawl (EE) is unlocked, then open primary throttle valves all the way. Lock-out lever (JJ) should fall free allowing secondary throttle valves to be open before primary throttle valves are fully open. If necessary, bend tang (GG) on secondary throttle arm to provide clearance for proper operation of lock-out

FAST IDLE AND SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 7): (Cont'd)

lever 3 Fast Idle Adjustment With choke valve tigthly closed tighten fast idle adjustment screw (CC) until there is 020" opening between throttle valve and bore of carbureter (side opposite idle port) (DD) Use gauge T109-29 Be sure fast idle adjusting screw (CC) is on high step of cam while making this adjustment

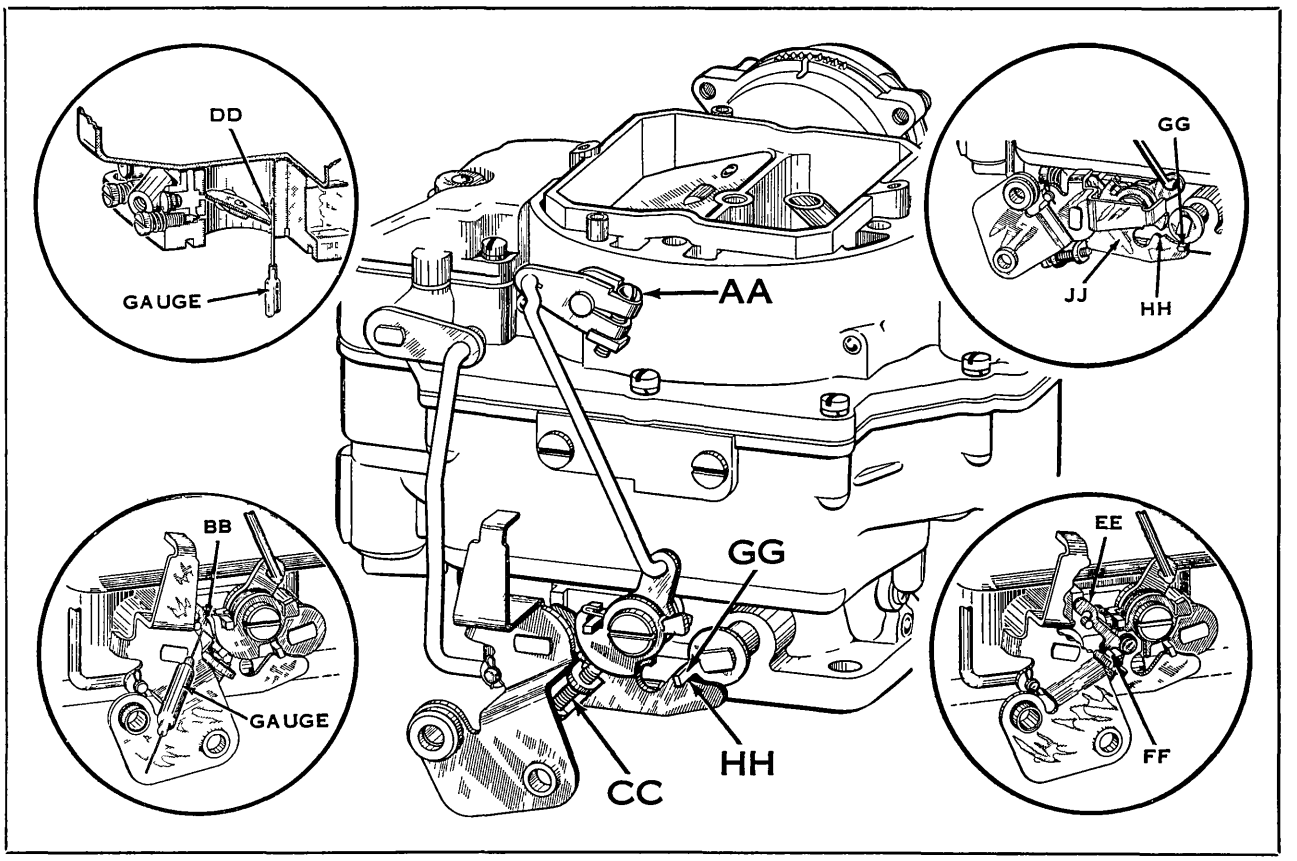

Figure 7
Fast Idle and Secondary Throttle Lock-out Adjustment

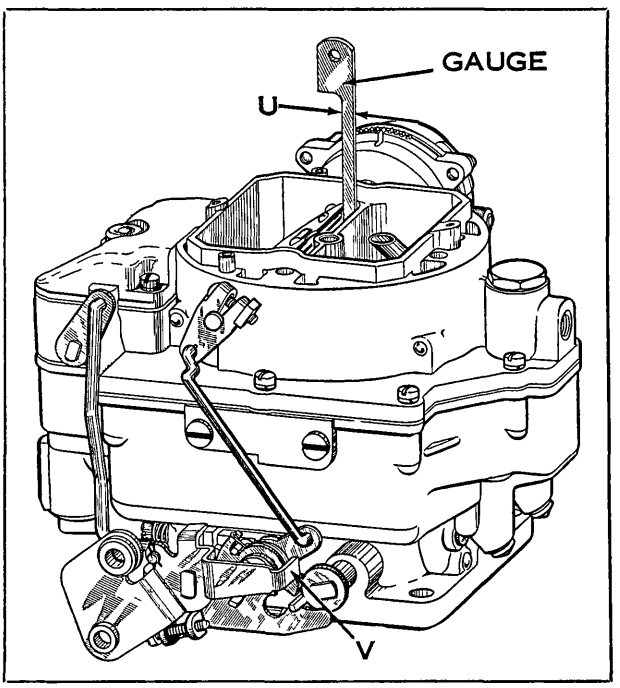

Figure 8
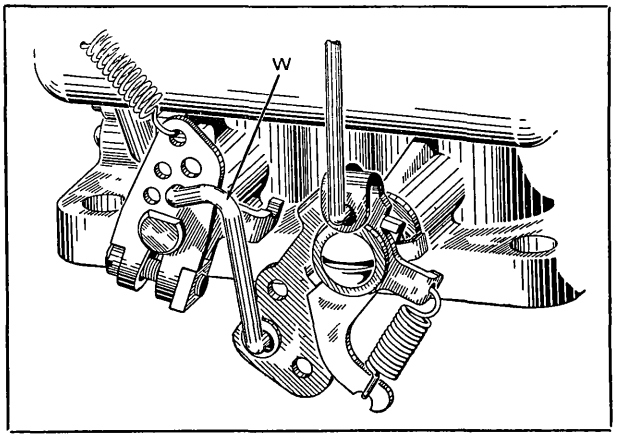
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 8)
With throttle wide open there should be 3/16" clearance (U) between upper edge of choke valve and inner wall of air horn (gauge T109-28) Adjust by bending unloader lip (V) on throttle shaft lever (use bending tool T109-41)

SECONDARY THROTTLE LEVER ADJUSTMENT (Fig 9)
Install throttle return spring in bracket and top hole of secondary throttle lever To increase tension of spring turn bracket NOTE—There must be clearance between spring and boss on body

Primary and secondary throttle valves should reach wide open position at the same time To adjust, bend throttle operating rod at upper angle (W) (Use bending tool T109-213).



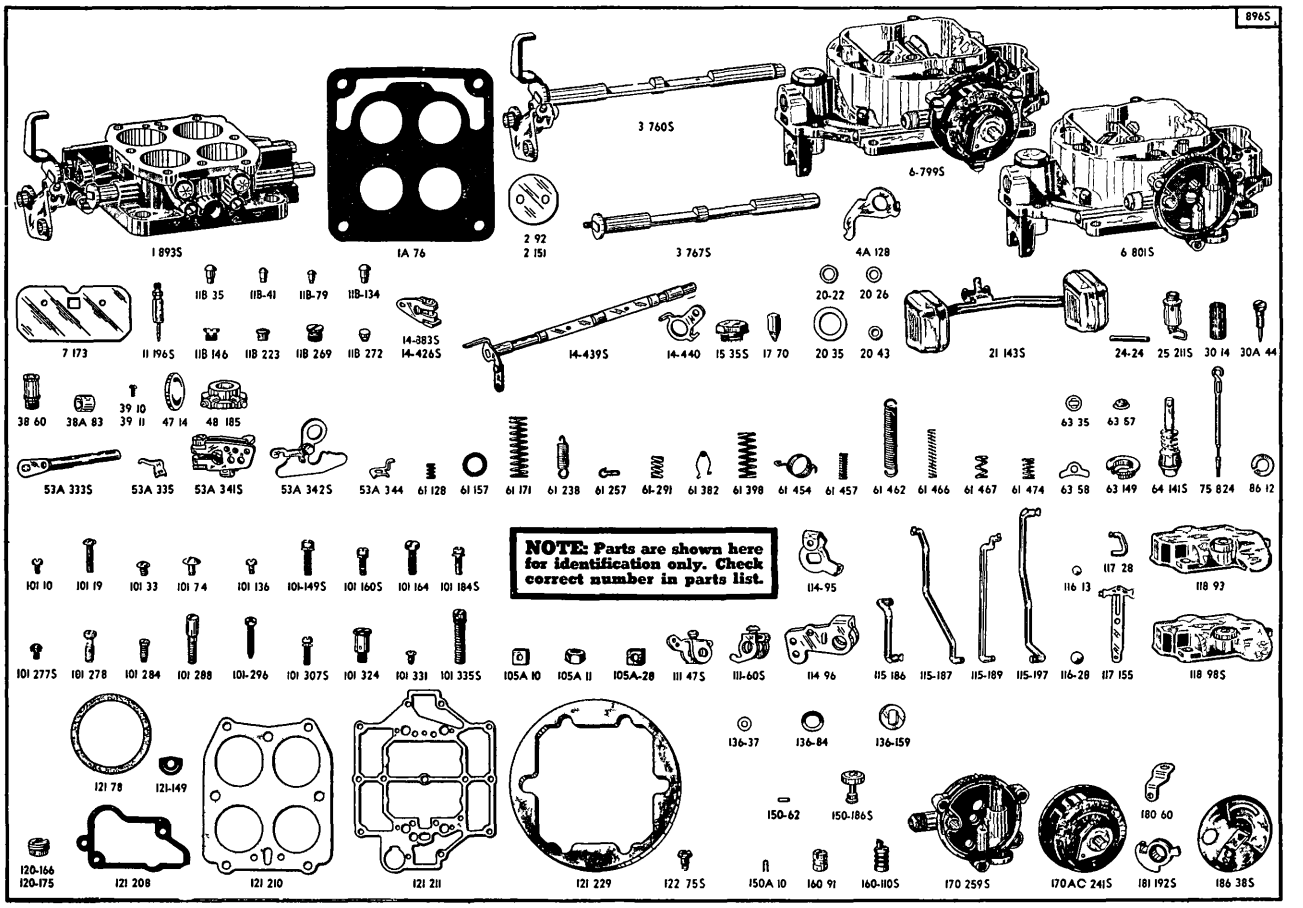


Figure 9
Secondary Throttle Lever Adjustment

Casting No. 821 on Face of Flange

CADILLAC EIGHT 1951

WCD DUAL DOWN-DRAFT CLIMATIC® CONTROL CARBURETER—**MODEL 845S**

CARBURETER SPECIFICATIONS

For Cadillac 8 Cylinder Engine: 3-13/16 Inch Bore, 3⅝ Inch Stroke

Dimensions: Flange size, 1¼ inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 21/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: See illustration.

Vents: (In air horn.) Outside, No. 12 drill—2 holes. Inside, No. 40 drill—2 holes.

Gasoline Intake: No. 38 drill in needle seat.

Low Speed Jet Tube: Jet size, No. 70 drill.
By-pass, size No. 58 drill. (.042 inch)
Economizer, size No. 65 drill. (.035 inch)
Idle bleed, size No. 58 drill. (.042 inch)

Idle Ports: Upper port, length, .175 inch. Width, .030 inch.

Idle Port Opening: .119 to .125 inch above upper edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: ¾ to 1¼ turns open. For richer mixture turn screw out. Do not attempt to idle engine below 375 r.p.m. (Hydr. Trans.) 400 r.p.m. (Std. Trans.).

Main Nozzle: Nozzle is installed permanently. **Do not remove.**

Metering Rod (Vacumeter Type): Economy step .0675 inch diameter. Middle step tapers to .062 inch diameter. Power step .048 inch diameter. (This rod is designed with idle stabilizing flat on economy step.)

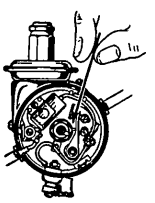
Metering Rod Jet: .089 inch diameter.

Metering Rod Setting: See Adjustments.

Accelerating Pump: Spring operated plunger. Discharge jet (twin) size, No. 72 drill. Intake ball check size, No. 32 drill. Discharge (needle seat) size, No. 50 drill.

Pump Adjustment: See Adjustments.

Choke: Carter Climatic ® Control, set one point rich. (See Adjustments.) Choke heat suction hole, in bowl cover. Size No. 43 (.089 inch) drill.



Vacuum Spark Port: Horizontal slot type, round end, .045 x .110 inch. Top of port .033 to .043 inch above valve.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT:

Two separate float adjustments must be made—lateral and vertical.

Lateral Adjustment: With bowl cover assembly inverted, bowl cover gasket removed and float lip resting on seated needle, place float gauge T109-205 directly under float with notched portions of gauge fitted over edges of casting. Sides of floats should barely touch the vertical uprights of float gauge. Adjustment should be made by bending arms of floats.

Vertical Adjustments: With float gauge in same position, floats should just clear the horizontal portion of gauge. (Vertical distance between top of float and machined surface of casting must be 11/64".) Adjust by bending float arms. Remove float, install bowl cover gasket and then reinstall float.

PUMP ADJUSTMENT (Fig. 1):

The total distance the plunger head (not shaft) moves from closed to wide open throttle position controls the amount of fuel discharged. Correct pump plunger travel is important and should be checked each time the carbureter is disassembled or when leaner than standard metering rods are installed. Procedure is as follows Install pump connector link in outer hole (long stroke) of pump arm (A), with ends extending away from countershaft arm. Back out **throttle lever set screw** until throttle valves seat in bores of carbureter. Be sure **fast idle adjusting screw** does not hold throttle open. Place universal pump travel gauge T109-117S inverted on edge of dust cover boss of bowl cover. Turn knurled nut of gauge until finger (B) just touches upper end of plunger shaft. Number indicated on gauge should be "30". Hold the gauge vertical to insure correct reading. Adjust by bending the throttle connector rod at upper angle (C). Optional Adjustment: With throttle valves seated in bores of carbureter, the distance from the top of the plunger shaft to the top of the dust cover boss should be 19/64 inches. Adjust as mentioned above.

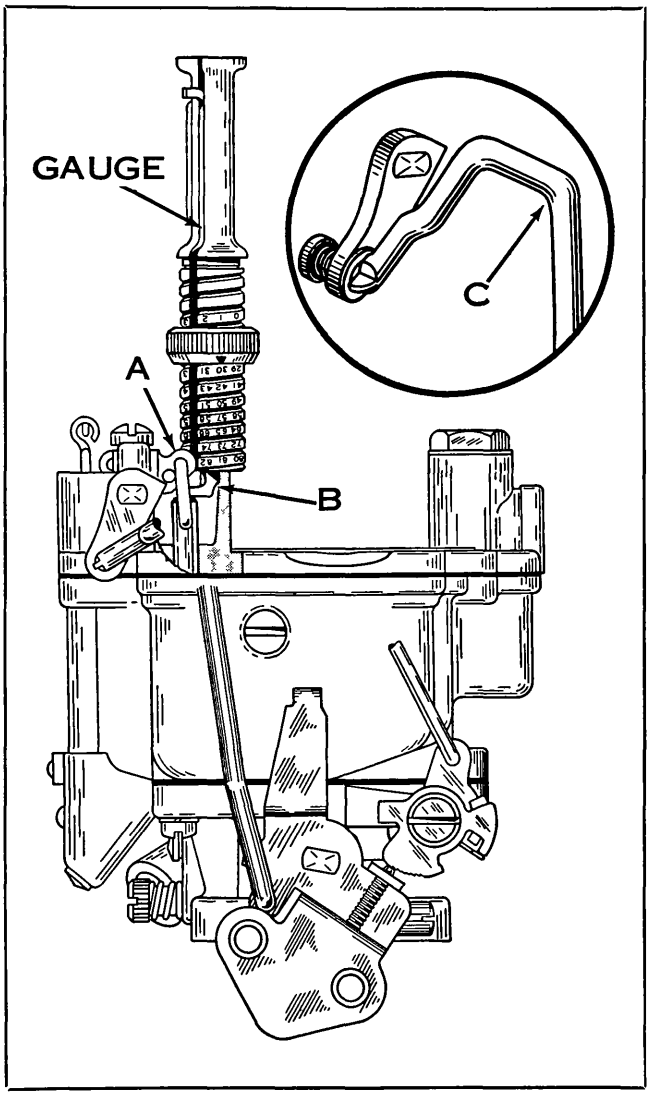

Figure 1

METERING ROD ADJUSTMENT (Fig. 2):

Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows:

1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (D).
2. With metering rods in place, press down on vacumeter link (E) until metering rods bottom in carbureter body casting (F).
3. Holding rods in downward position and throttle valves seated, revolve metering rod arm (G) until finger on arm contacts lip (H) of vacumeter link. Hold in place and carefully tighten clamp screw (D).

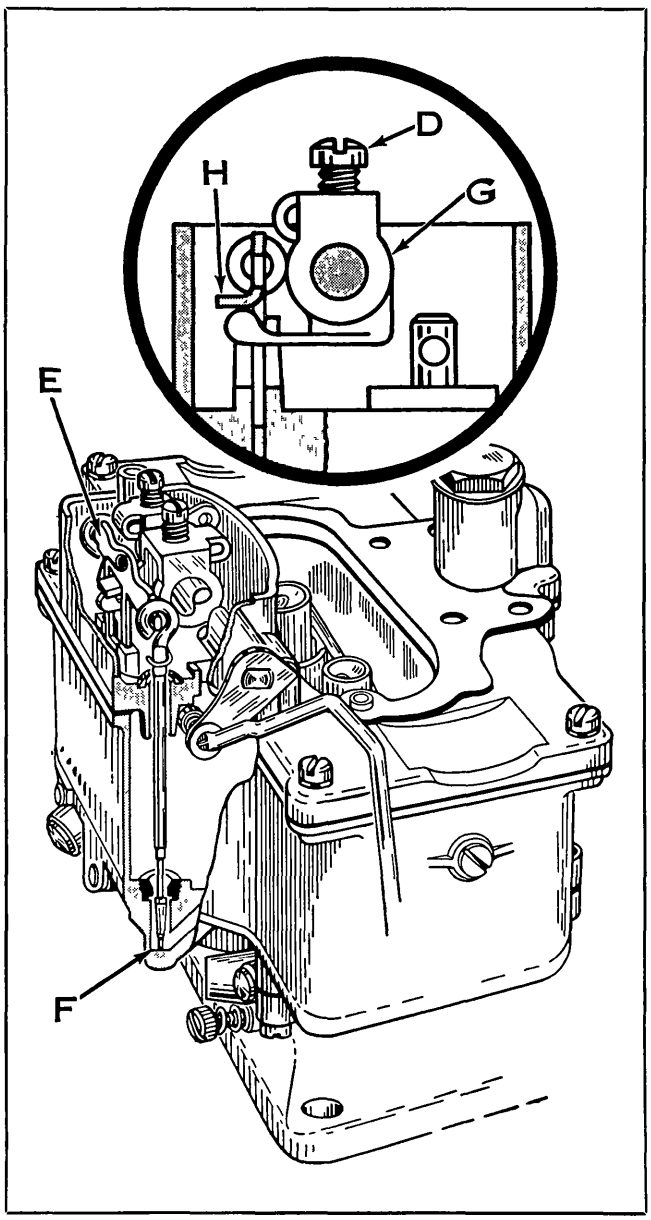

Figure 2

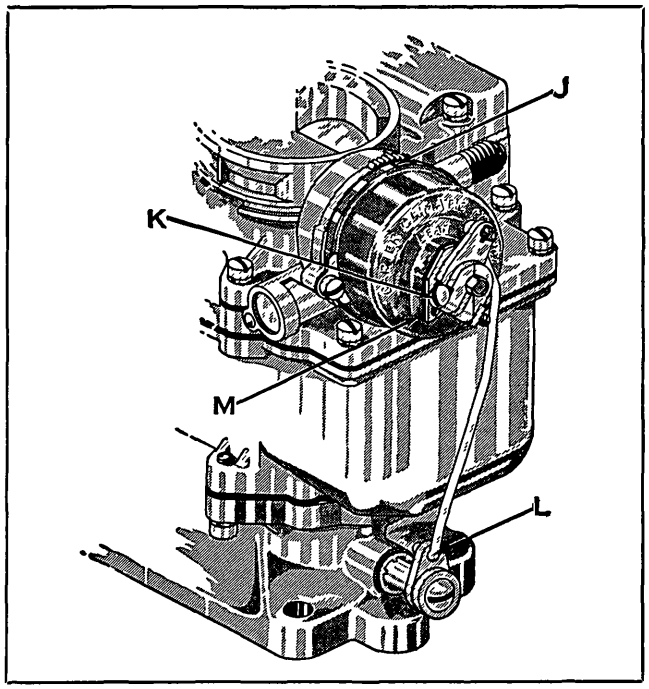

Figure 3

CHOKE MODIFIER ADJUSTMENT (Fig. 3):

1. Set Climatic ® Control Assembly one point rich (J).
2. Loosen screw (K).
3. Remove lower end of connector rod (L).
4. Rotate metal pointer until it is in line with raised pointer on coil housing (M).
5. Align scribed line on lever so that it is straight up and down. Hold in place and tighten screw (K).
6. Seat throttle valves (back out throttle lever set screw and hold choke valve wide open).
7. Hold pointer as indicated in No. 4. Lower end of rod must slide freely into hole in throttle arm. Bend rod at upper angle to adjust.

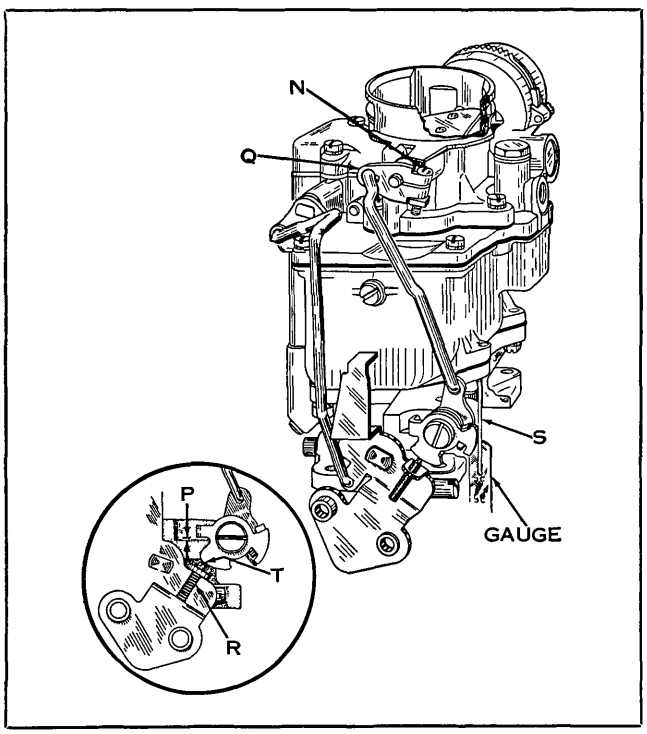

Figure 4

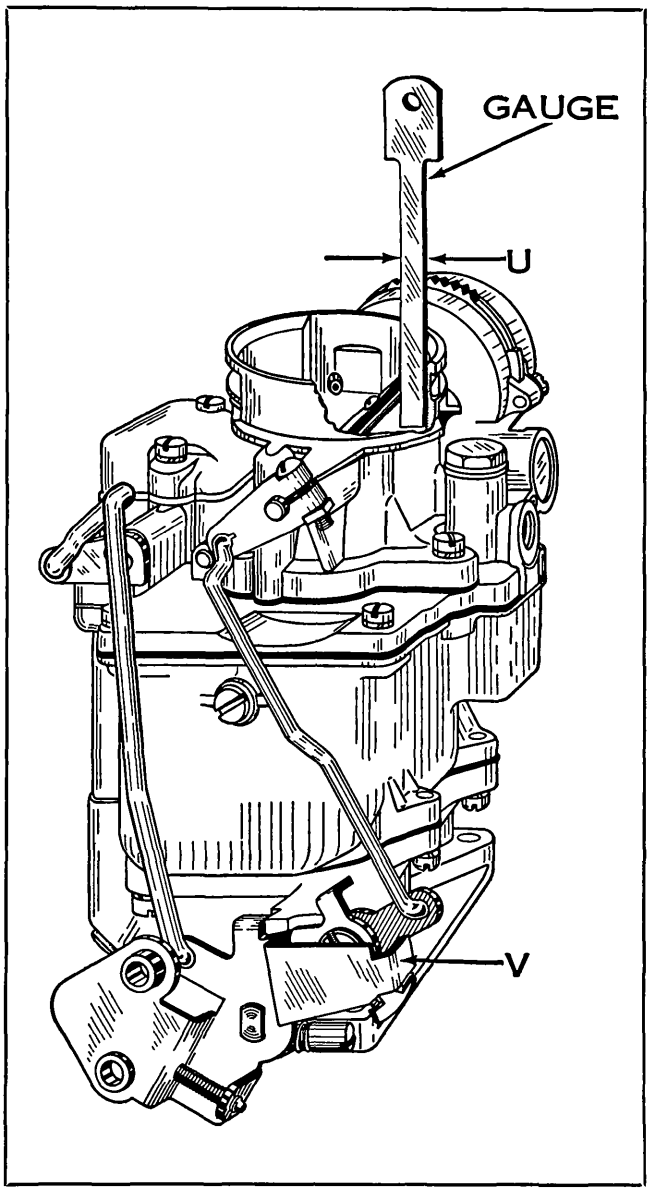
FAST IDLE ADJUSTMENT (Fig. 4):

A. Loosen choke lever clamp screw (N) on choke shaft. Insert .020" feeler gauge T109-29 between lip of fast idle cam and boss of flange casting (P). Hold choke valve tightly closed and take slack out of linkage by pressing choke lever (Q) towards closed position—hold in place and tighten clamp screw (N). B. With choke valve tightly closed, tighten fast idle adjusting screw (R) until there is .020" opening (S) between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam (T) while making this adjustment.



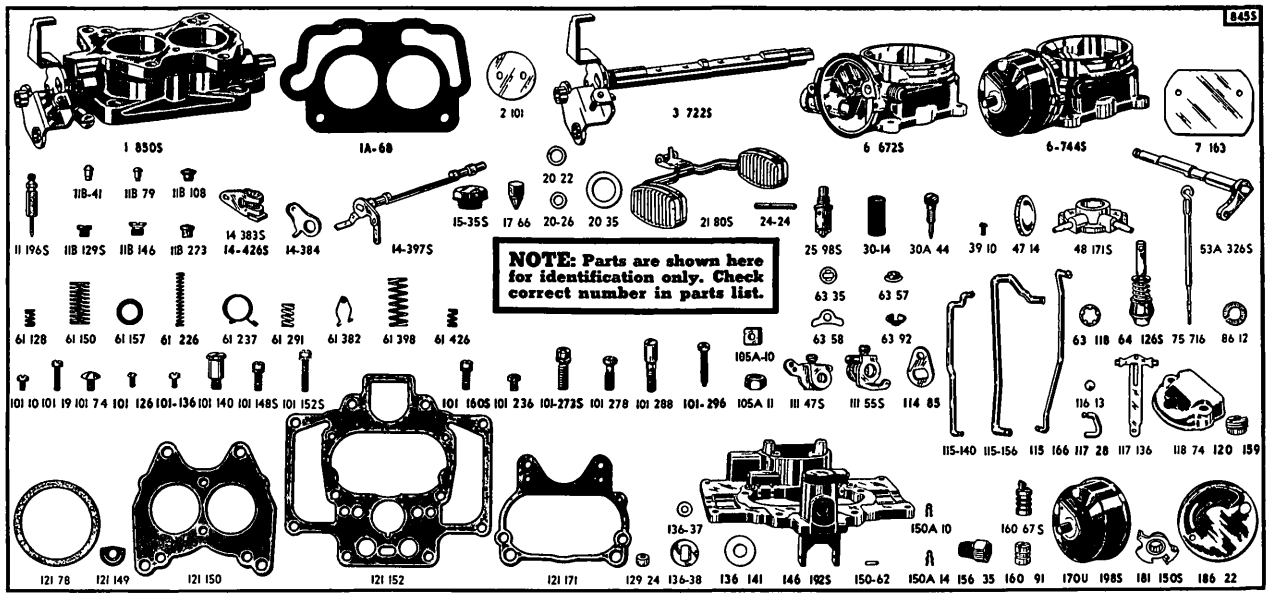


Figure 5

UNLOADER ADJUSTMENT (Fig. 5):

With throttle wide open there should be 7/32" clearance (U) between upper edge of choke valve and inner wall of air horn (gauge T109-106). Adjust by bending unloader lip (V) on **throttle** *shaft lever (use bending tool T109-41)*

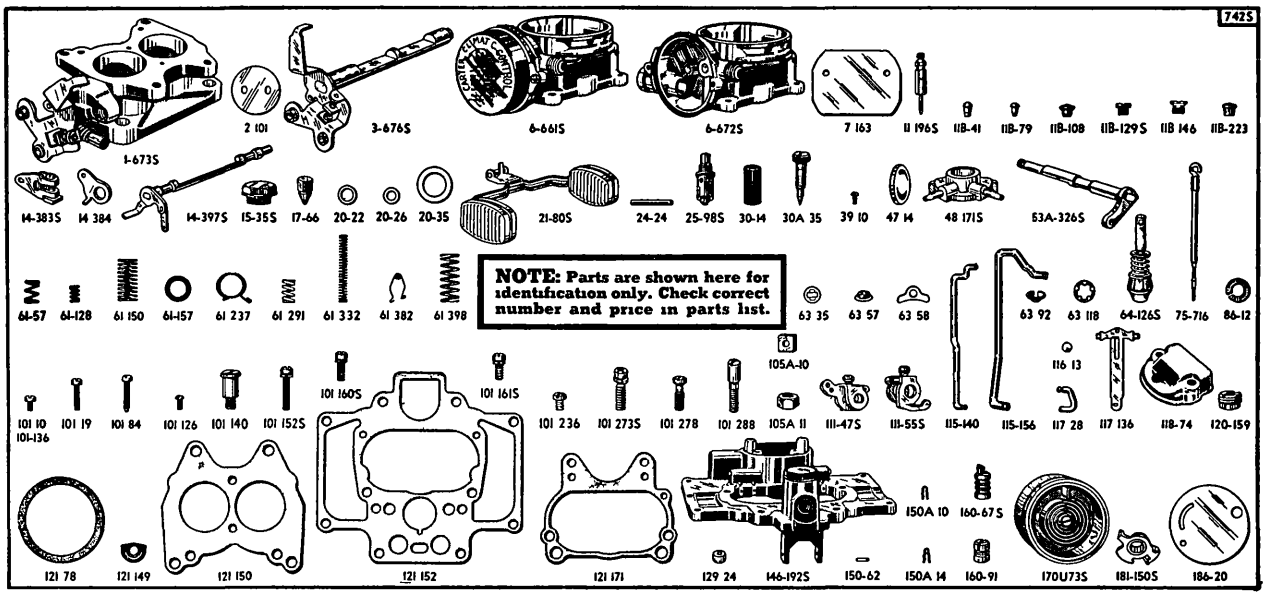
PRINTED IN U S A

upper end of plunger shaft Number indicated on gauge should be '30' Hold the gauge vertical to insure correct reading Adjust by bending the throttle connector rod at upper angle Optional Adjustment With throttle valves seated in bores of carbureter, the distance from the top of the plunger shaft to the top of the dust cover boss should be 19/64 inches Adjust as mentioned above

Metering Rod Adjustment Metering rod adjustment is important and must be done after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows



1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw.

2 With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting

3 Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

Fast Idle Adjustment: A Loosen choke lever clamp screw on choke shaft Insert .020" feeler gauge T109-29 between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw B With choke valve tightly closed, tighten fast idle adjusting screw until there is .020" opening between throttle valve and bore of carbureter (side opposite idle port) Use gauge T109-29 Be sure fast idle adjusting screw is on high step of cam while making this adjustment

Unloader Adjustment: With throttle wide open there should be 7/32" clearance between upper edge of choke valve and inner wall of air horn (gauge T109-106) Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41)

Cadillac—1950—No. 742S

CADILLAC EIGHT 1949

WCD Dual Down-Draft Climatic® Control Carbureter—**Model 722S**

CARBURETER SPECIFICATIONS

For Cadillac 8 Cylinder Engine: 3-13/16 Inch Bore, 3⅝ Inch Stroke

Dimensions: Flange size, 1¼ inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 19/32 inch I. D
Main venturi, 1-3/16 inch I. D.

Float Level: Distance from seam of float (both sides—at top center) to lower edge of bowl cover, when needle is seated to be 9/64 inch. (Use gauge No. T109-160)

Vents: (In air horn) Outside, No. 30 drill—2 holes. Inside No. 35 drill—2 holes.

Gasoline Intake: Square vertical needle. Size No. 38 drill in needle seat.

Low Speed Jet Tube: Jet size, No. 68 drill (early production) No. 70 drill (late production).
By-pass, size No 57 drill.
Economizer, size No. 60 drill.
Idle bleed, size No. 56 drill.

Idle Ports: Upper port, length, .175 inch. Width, .030 inch.

Idle Port Opening: .115 to .121 inch above upper edge of valve with valve closed tight.

Lower Port (For Idle Adjustment Screw): Size 0615 to 0655 inch diameter

Set Idle Adjustment Screw: ½ to 1½ turns open For richer mixture turn screw out. Do not attempt to idle engine below 375 r.p.m. (Hydra Trans.), 400 r.p.m. (Std. Trans.).

Main Nozzle: In primary venturi, closed tip, angle 49° from horizontal Nozzle is installed permanently. Do not remove

Metering Rod (Vacumeter Type): Economy step 0695 inch diameter Middle step tapers to 059 inch diameter. Power step 0545 inch diameter. Length 3-41/64 inches.

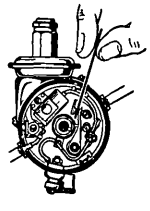
Metering Rod Jet: 089 inch diameter.

Metering Rod Setting: With throttle tightly closed, hold metering rods (assembled on vacumeter link) in maximum down position Tighten clamp screw securely with metering rod arm contacting vacumeter link.

Accelerating Pump: Pressure, delayed action type (spring operated plunger).
Discharge jet (twin) size, No. 70 drill.
Intake ball check size, No. 32 drill.
Discharge (needle seat) size, No. 53 drill.

Pump Adjustment: "32" as indicated on gauge T109-117S with throttle valves seated or 5/16" from top of pump shaft to the top of the dust cover housing

Choke: Carter Climatic® Control, set at center index point. Offset butterfly type Choke heat suction hole, in bowl cover Size No 42 (.093") drill



Vacuum Spark Port: Horizontal slot type, round end .045 x .110 inch. Top of port .033 to .043 inch above valve

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

Float Adjustment: Two separate float adjustments must be made—lateral and vertical, as follows With bowl cover assembly inverted, gasket removed, and float resting on seated needle, place gauge T109-160 (9/64") directly under float with notched portions of gauge fitted over machined surface of casting Float should just touch vertical sides of gauge and just clear horizontal portion Adjust by bending arms of float Remove gauge, install bowl cover gasket, then reinstall float

Pump Adjustment: The total distance the plunger head (not shaft) moves from closed to wide open throttle position controls the amount of fuel discharged Correct pump plunger travel is important and should be checked each time the carbureter is dis-assembled or when leaner than standard metering rods are installed Procedure is as follows
Install pump connector link in upper hole (long stroke) of pump arm, with ends extending away from countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Be sure fast idle adjusting screw does not hold throttle open. Place universal pump travel gauge T109-117S, inverted on edge of dust cover boss of bowl cover Turn knurled nut of gauge until finger just touches upper end of plunger shaft Number indicated on gauge should be "32" Hold the gauge vertical to insure correct reading

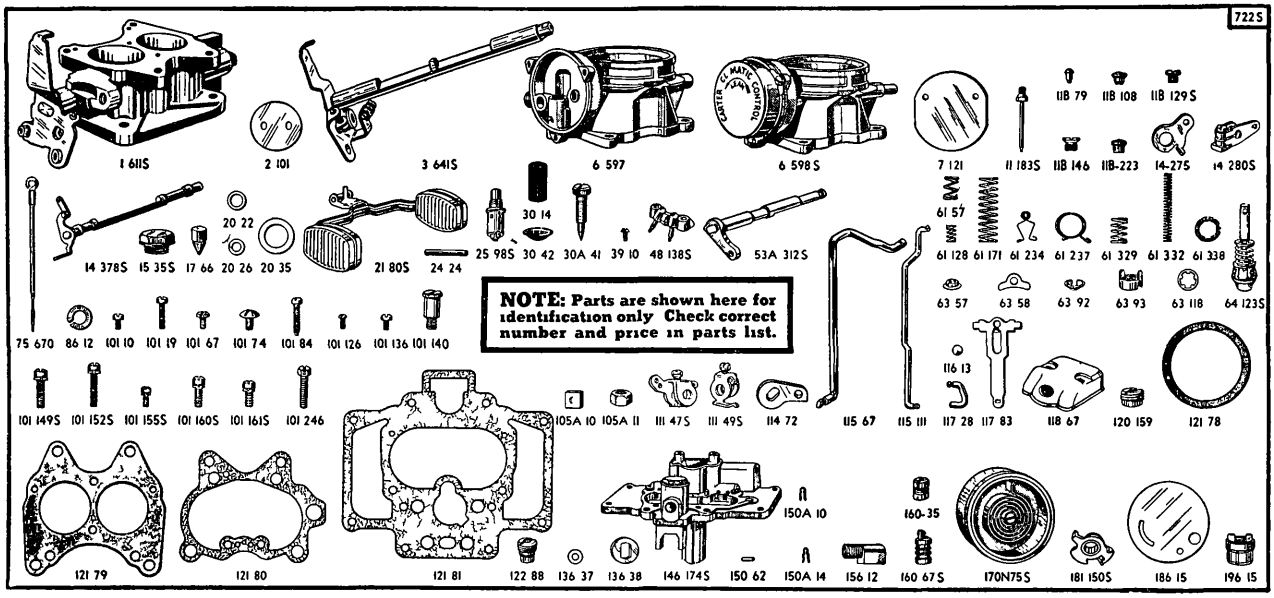
PRINTED IN U.S.A.

Adjust by bending the throttle connector rod at upper angle Optional Adjustment With throttle valves seated in bores of carbureter the distance from the top of the plunger shaft to the top of the dust cover boss should be 5/16 Adjust as mentioned above

Metering Rod Adjustment Metering rod gauging is important and must be done after completing the pump adjustment No metering rod gauges are necessary on these carbureters Procedure is as follows

1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw



2 With metering rods in place press down on vacumeter link until metering rods bottom in carbureter body casting

3 Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Then carefully tighten clamp screw

Fast Idle Adjustment A Loosen choke lever clamp screw on choke shaft Insert 010 feeler gauge T109-200 between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw

B With choke valve tightly closed tighten fast idle adjusting screw until there is 020 opening between throttle valve and bore of carbureter (side opposite idle port) Use gauge T109-29 Be sure fast idle adjusting screw is on high step of cam while making this adjustment

Unloader Adjustment With throttle wide open there should be 3/16' clearance between upper edge of choke valve and inner wall of air horn (gauge T109-28) Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41)

WCD Dual Down-Draft Climatic® Control Carbureter—**Model 682S**

CARBURETER SPECIFICATIONS

For Cadillac 8 Cylinder Engine: 3-13/16 Inch Bore, 3⅝ Inch Stroke

Dimensions: Flange size, 1¼ inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 19/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: Distance from seam of float (both sides—at top center) to lower edge of bowl cover, when needle is seated to be 9/64 inch. (Use gauge No. T109-160.)

Vents: (In air horn.) Outside, No. 30 drill—2 holes. Inside, No. 35 drill—2 holes.

Gasoline Intake: Square vertical needle. Size No. 38 drill in needle seat.

Low Speed Jet Tube: Jet size, No. 68 drill.
By-pass, size No. 57 drill.
Economizer, size No. 60 drill.
Idle bleed, size No. 56 drill.

Idle Ports: Upper port, length, .175 inch. Width, .030 inch.

Idle Port Opening: .115 to .121 inch above upper edge of valve with valve closed tight.

Lower Port (For Idle Adjustment Screw): Size .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Do not attempt to idle engine below 8 m.p.h.

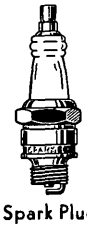
Main Nozzle: In primary venturi, closed tip angle 49° from horizontal. Nozzle is installed permanently. Do not remove.

Metering Rod (Vacumeter Type): Economy step .065 inch diameter. Middle step tapers to .062 inch diameter. Power step .054 inch diameter. Length 3-41/64 inches.

Metering Rod Jet: .089 inch diameter.

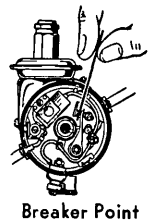
Metering Rod Setting: Use gauge, part No. T109-163 (2.940 inches).

Accelerating Pump: Pressure type, delayed action (spring operated plunger).
Discharge jet (twin) size, No. 70 drill.
Intake ball check size, No. 32 drill.
Discharge (needle seat) size, No. 53 drill.



Pump Adjustment: "24" as indicated on T109-117S with throttle valve seated or 7/32" from top of pump shaft to the top of dust cover housing.

Choke: Carter Climatic® Control, set 1 point rich. Offset butterfly type. Choke heat suction hole, in bowl cover. Size No. 42 (.093") drill.



Vacuum Spark Port: Slot type .045 by .110 inch. Top of port .033 to .043 inch above valve.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

PRINTED IN U.S.A.

sure fast idle adjusting screw does not hold throttle open Place universal pump travel gauge T109-117S inverted on edge of dust cover boss of bowl cover Turn knurled nut of gauge until finger just touches upper end of plunger shaft Number indicated on gauge should be "24 Hold the gauge vertical to insure correct reading
Adjust by bending the throttle connector rod at upper angle Optional adjustment With throttle valves seated in bores of carbureter, the distance from the top of the plunger shaft to the top of the dust cover boss should be 7/32'
Adjust as mentioned above
Metering Rod Adjustment With throttle valves seated in bores of carbureter, insert one metering rod gauge T109 163 in place of either metering rod Press down lightly on vacuum piston link until lug of piston link contacts lip of metering rod arm There should be less than 005 clearance between metering rod bearing and shoulder in notch of gauge

Adjust by bending lip of metering rod arm (Tool T109-105)
Fast Idle Adjustment With choke valve tightly closed, tighten fast idle adjusting screw until there is 020 opening between throttle valve and bore of carbureter (side opposite idle port) Use gauge T109-29 Be sure fast idle adjusting screw is on high step of cam while making this adjustment
Unloader Adjustment Two adjustments are necessary

A Loosen choke lever clamp screw on choke shaft Insert 010" feeler gauge between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw

B With throttle wide open there should be 3/16' clearance between upper edge of choke valve and inner wall of air horn (gauge T109-28) Adjust by bending unloader lip on throttle shaft lever (T109-41)

August, 1946
Revised September, 1953

ALL MODELS

CADILLAC EIGHT 1946-47-48

Casting No. 456 on Face of Flange (595S)
Casting No. 552 on Face of Flange (595SA)

WCD Dual Down-Draft Climatic® Control Carbureters—**Models 595S-595SA**

CARBURETER SPECIFICATIONS

For Cadillac 8 Cylinder Engine: 3½ Inch Bore, 4½ Inch Stroke

Dimensions: Flange size, 1¼ inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 19/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: Distance from seam of float (both sides—at top center) to lower edge of bowl cover, when needle is seated to be 9/64 inch. (Use gauge No. T109-160.)

Vents: (In air horn.) Outside, No. 30 drill—2 holes.
Inside, No. 35 drill—2 holes.

Gasoline Intake: Square vertical needle. Size No. 38 drill in needle seat.

Low Speed Jet Tube: Jet size, No. 70 drill.
By-pass, size No. 55 drill.
Economizer, size No. 58 drill.
Idle bleed, size No. 56 drill.

Idle Ports: Upper port, length, .156 inch. Width, .030 inch, with .0635 inch diameter hole located .071 inch from top of port.

Idle Port Opening: .100 to .106 inch above upper edge of valve with valve closed tight.

Lower Port (For Idle Adjustment Screw): Size .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Do not attempt to idle engine below 8 m.p.h.

Main Nozzle: In primary venturi, closed tip angle 49° from horizontal. Nozzle is installed permanently. **Do not remove.**

Metering Rod (Vacumeter Type): Economy step .0695 inch diameter. Middle step tapers to .0605 inch diameter. Power step .054 inch diameter. Length 3-41/64 inches.

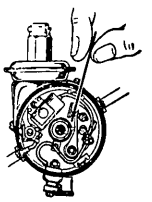
Metering Rod Jet: .089 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-163 (2.940 inches).

Accelerating Pump: High pressure delayed action type (spring operated plunger)
Discharge jet (twin) size, No. 70 drill.
Intake ball check size, No. 40 drill (Early production).
Intake ball check size, No. 32 drill (Late production).
Discharge (needle seat) size, No. 53 drill.

Pump Adjustment: 27/64 inch plunger travel (full throttle position). Use gauge No. T109-117S.

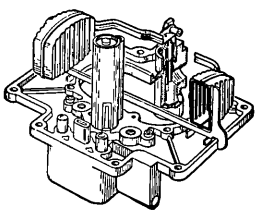
Choke: Carter Climatic® Control, set at center index point. Offset butterfly type. Choke heat huction hole, in bowl cover. Size No. 42 (.093") drill.



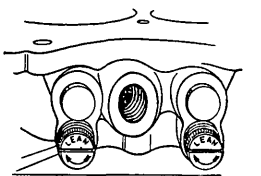
Vacuum Spark Port: .039 to .041 inch diameter. Top of port .033 to .037 inch above valve (Early production). Top of port .030 to .040 inch above valve (Late production).

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap
028"-.033"



Breaker Point Setting

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT

Two separate float adjustments must be made—lateral and vertical

LATERAL ADJUSTMENT

With bowl cover assembly inverted bowl cover gasket removed and float bracket resting on seated needle place float gauge T109 160 directly under float with notched portions of gauge fitted over edges of casting Sides of floats should barely touch the vertical uprights of float gauge (A—Fig 1) Adjustment should be made by bending **arm** of float

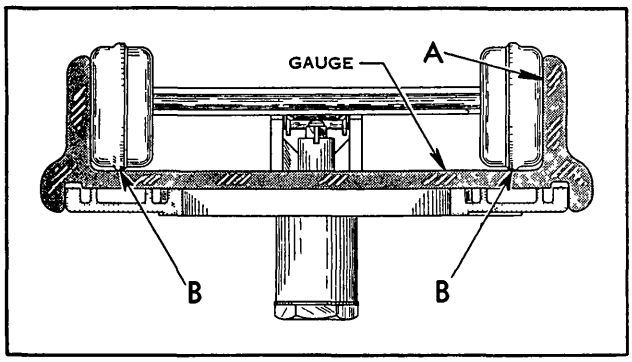

Figure 1
Float Adjustment

VERTICAL ADJUSTMENT

With float gauge in position shown floats should just clear the horizontal portion of gauge (B—Fig 1) Vertical distance between top of float and machined surface of casting should be 9/64 inch Adjustment can be made by bending **arm** of float Carefully remove float install bowl cover gasket and then reinstall float

Floats should have a free movement of 1/2" at free end of float Adjust by bending lip of float bracket

A fast check of the fuel level can be made on the car by removing the inspection hole plug in the side of carbureter body Fuel should just run out of the hole—with engine idling

PUMP ADJUSTMENT (Fig 2)

The accelerating pump has been designed to produce a uniform pump action The total distance the **plunger** (not shaft) moves from closed to wide open throttle controls the amount of fuel discharge Correct pump plunger travel is important and should be checked each time the carbureter is disassembled Procedure is as follows With pump connector link in place back out throttle lever set screw and fast idle adjustment screw to allow throttle valves to seat in bore of carbureter Support carbureter so throttle can be closed without levers dragging on bench top (wooden block will suffice) With air horn assembly removed place pump travel gauge T109 117S inverted on edge of dust cover boss of bowl cover Turn knurled nut on pump travel gauge until finger contacts upper surface of pump connector link where it extends through the plunger shaft (E) Take gauge reading

Open throttle slowly until plunger bottoms in pump cylinder (at approximately half throttle) This can be determined by the additional force necessary to continue to move throttle lever Relocate pump travel gauge and turn knurled nut until finger again touches link Observe number indicated on gauge Hold gauge vertical to insure correct pump stroke readings The difference in the two readings obtained should be 27 (27/64" plunger travel)

Adjust by bending throttle connector rod at lower angle (F)

FLANGE ASSEMBLY

The difference between 595S and 595SA is in the flange assembly The throttle centering screw 101 130 has been removed from flange 1 553S used on 595SA Throttle shaft and lever assembly 3 601S must be used with this flange as shaft is not grooved for the throttle centering screw but has additional length to accommodate throttle shaft retaining ring 63 118

To assemble flange 1 457S (with throttle centering screw) install throttle shaft and lever assembly and throttle centering screw then install throttle valves with c in circle **toward the idle port** when viewing the carbureter from the manifold side Center valves by tapping lightly and holding in place with fingers **before** tightening screws Always use new screws

To assemble flange 1 553S (without centering screw) install throttle shaft and turn to closed throttle position Push retaining ring **with prongs extending outward,** over end of throttle shaft until it is against casting (no endplay in shaft) Throttle valves should then be installed centering them as mentioned above with throttle lever in closed position and throttle lever set screw backed out

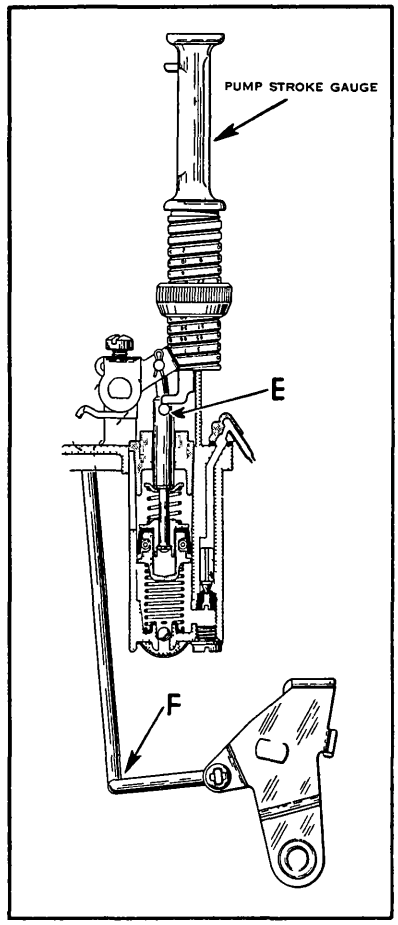

Figure 2
Pump Stroke Adjustment

Note It is advisable before taking pump gauge readings to practice opening throttle several times to find position at which increased throttle resistance indicates plunger bottoming in cylinder

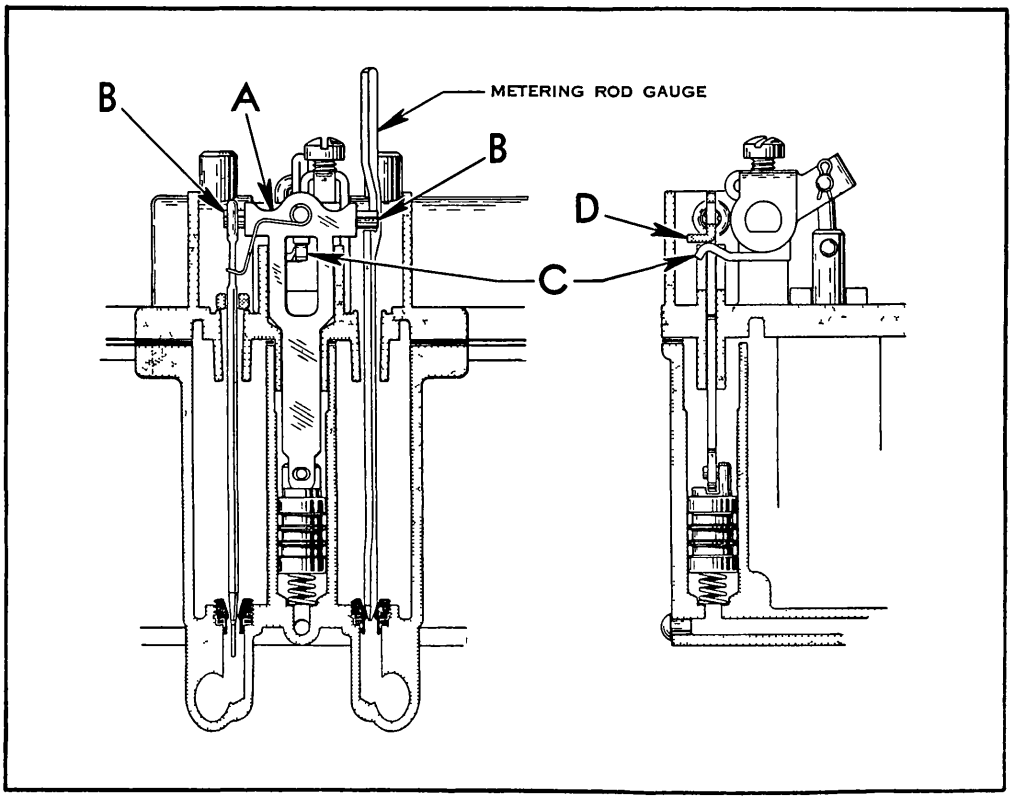

Figure 3
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 3):

Correct setting of metering rod is important and should be made each time carbureter is disassembled or leaner than standard rods are installed. Procedure is as follows: Back out throttle lever adjusting screw until throttle valves seat in bores of carbureter. Insert one metering rod gauge T109-163 in place of either metering rod. Press down lightly on vacuum piston link (A) until lug of piston link (D) contacts lip of metering rod arm (C). There should be less than .005" clearance between metering rod bearing (B) and shoulder in notch of metering rod gauge with throttle valves seated. Adjustment should be made by bending lip of metering rod arm (C). Use bending tool T109-105.

UNLOADER ADJUSTMENT (Figs. 4 and 5):

Two adjustments are necessary for correct unloader setting:

A Loosen choke lever and screw assembly on choke shaft (G). Insert .010" feeler gauge (T109-71) between lip on fast idle cam and boss on flange casting (H). Hold choke valve tightly closed and take all slack out of linkage by pressing choke lever toward closed position — then tighten clamp screw.

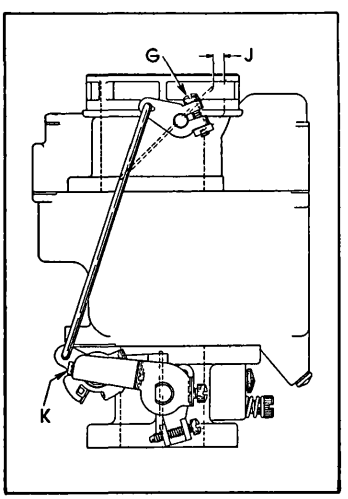

Figure 4
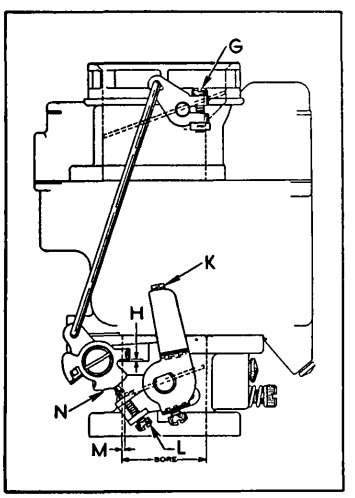
Unloader Setting

B Adjust unloader lip (K) on throttle shaft lever until there is 3/16" clearance between upper edge of choke valve and inner wall of air horn (J) **with throttle in wide open position.** Use gauge T109-28.



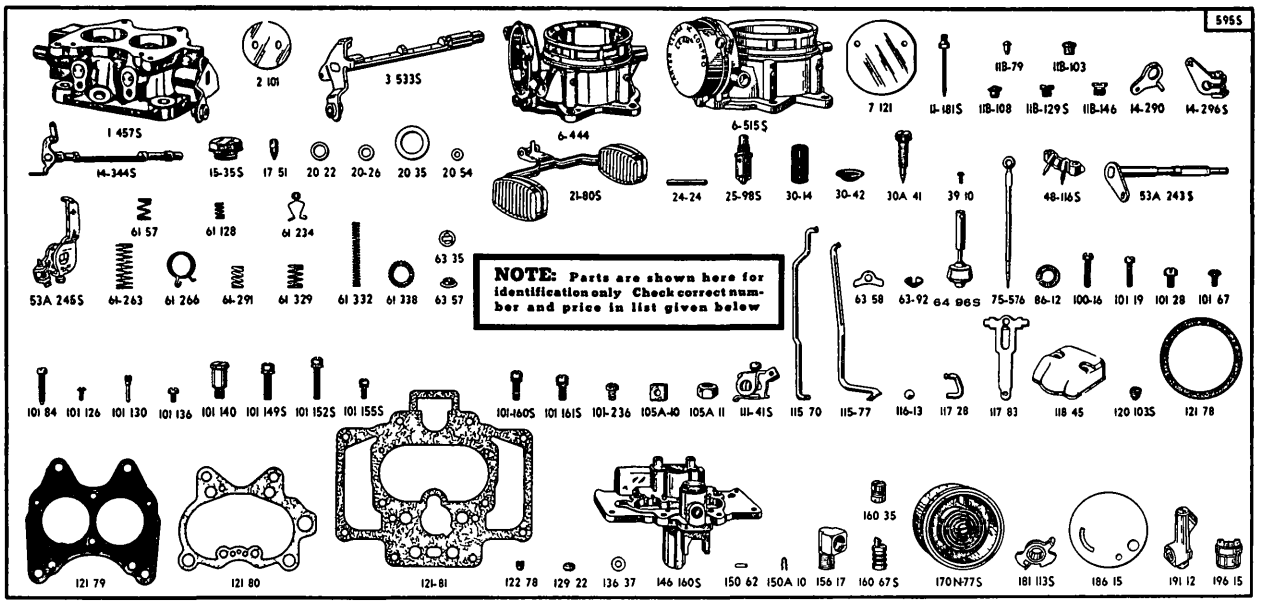


Figure 5
Fast Idle Setting

FAST IDLE ADJUSTMENT (Figs. 4 and 5):

With choke valve tightly closed, tighten fast idle set screw (L) until there is .018" (M) opening between throttle valve and bore of carbureter side opposite port. Use gauge T109-44. Be sure fast idle adjusting screw is on high step of cam (N) when making this adjustment.

SERVICE PROCEDURE

CAUTION: REMOVE HIGH SPEED NEEDLE BEFORE REMOVING BOWL

To Disassemble

1 Remove carbureter from engine

2 Remove high speed adjusting needle packing nut and packing (SCRIBE MARK ON BODY AND BOWL)

3 Remove bowl nut gasket and bowl

4 Remove float pin, float needle and needle seat Check float for dents, leaks and wear on float lip or in float pin holes

5 Remove bowl ring gasket

6 Remove idle adjustment screw and spring

7 Remove nozzle

8 Remove throttle valve screws valve and shaft and lever assembly

9 Clean all parts with solvent making sure all carbon accumulation is removed from bore, especially where throttle valve seats in casting Blow out all passages with compressed air Replace all worn and damaged parts Always use new gaskets

To Assemble

10 Install throttle shaft and valve Valve *must* be installed with trademark "C on side toward idle port when viewing from flange side Always use new screws With valve screws loose and throttle lever set screw backed out, seat valve by tapping lightly with a small screwdriver Hold in place while tightening screws

11 Install nozzle making sure it seats in casting

12 Install needle seat needle float and float pin

13 Set float level with carbureter casting inverted float resting lightly against needle in its seat There should be 3/32 inch clearance between outer surface of casting and free end of float (side opposite needle seat) Adjust by bending lip of float

14 Install bowl ring gasket, bowl (line up scribe marks), bowl nut gasket and bowl nut Tighten securely

15 Install high speed adjusting needle packing nut and new packing Turn needle in until it just seats in body then back out 1 turn

16 Install idle adjusting screw finger tight Back out approximately 1 turn Do not use pliers or screwdriver as it may damage idle screw

17 Install carbureter on engine and make idle and high speed adjustment as necessary

Three Carbureters
Per Engine

CHEVROLET
CORVETTE
1953-1955

Casting Number 1082 on Face of Flange

YH Horizontal **Carbureters Nos. 2066S-2066SA**

CARBURETER SPECIFICATIONS

For Chevrolet 6 Cylinder Engine: 3-9/16 Inch Bore, 3-15/16 Inch Stroke

Dimensions: Flange size, 1¼ inch 3 bolt.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1-5/16 inch I. D.

Float Level: See adjustments.

Vents: Outside, none. Inside, balance vent tube to air horn ahead of choke valve.

Gasoline Intake: Spring loaded needle. Size No. 46 (.081 inch) drill in needle seat.

Low Speed Jet Tube: Jet, size No. 70 (.028 inch) drill. By-pass in body, size .0492 inch diameter. Economizer, in bowl cover, size No. 54 (.055 inch) drill. Idle bleed, in bowl cover, size No. 58 (.042 inch) drill.

Idle Port: Upper port, slot type, length .162 inch; width .030 inch.

Idle Port Opening: Top of port to be .124 to .128 inch above top edge of valve with valve tightly closed.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Idle engine at 450 r.p.m. gear shift lever in Drive position.

Main Nozzle: Nozzle is installed permanently. Do not remove.

Metering Rod: Economy step, .061 inch diameter. Power step, .058 inch diameter.

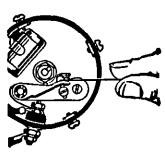
Metering Rod Jet: Size No. 45 (.082 inch) drill.

Metering Rod Setting: See adjustments.

Accelerating Pump: Diaphragm type, vacuum and mechanically operated. Pump discharges into nozzle passage. Intake check ball seat, size .115-.120 inch diameter. Discharge check ball seat, in body, size .115-.120 inch diameter. Pump bleed, in diaphragm housing, size No. 73 (.024 inch) drill. Vacuum passage restriction, in body, size No. 46 (.081 inch) drill. Vacuum bleed, to throttle bore, size No. 65 (.035 inch) drill. **Pump jet is permanently installed, do not remove.**

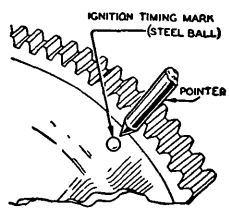
Pump Adjustment: None.

Choke: Manual, interconnected with throttle.



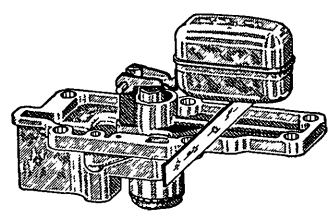
Vacuum Spark Port: Slot type, size .125 x .041 inch. (2066S-2066SA early prod.) Bottom of port to be .026 to .036; (2066SA late prod.). Top of port to be .016 to .026 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

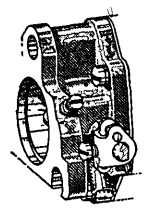


CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"



Breaker Point Setting .018"



Ignition Timing Breaker Points to Open: T. D. C. (When Steel Ball on Flywheel is in Line with Pointer)

Valve Setting (Hot) Intake .010" Exhaust .020"

Float Setting ⅜ Inch (Use gauge T109-80)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

Float Adjustment: With gasket removed, bowl cover assembly inverted and float resting on pin in seated needle, the distance from the bowl cover to the top of float should be ⅜ inch (gauge T109-80). Do not depress float lip against spring loaded pin in needle, but let float rest of its own weight. Adjust by bending float lever. Float setting must be checked with bowl cover held at eye height in a level position.

Float Drop: With bowl cover assembly held in upright position, the distance between float seam (at free end) and bowl cover should be 2". Adjust by bending stop tab on float arm.

CARBURETER ADJUSTMENTS

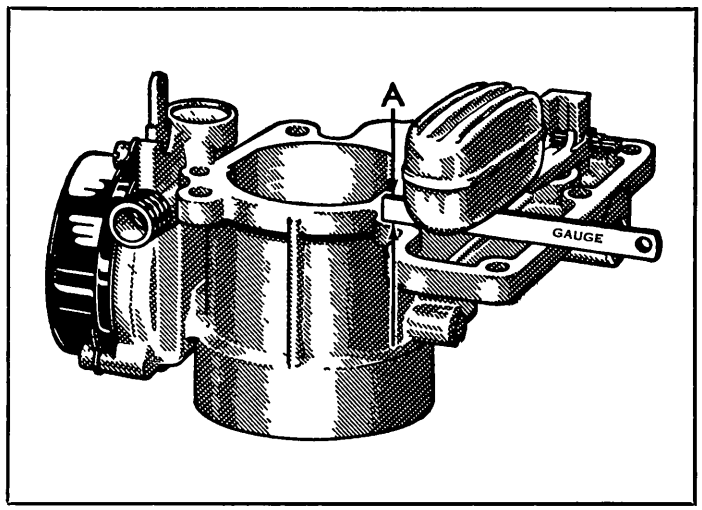

Figure 1
Float Adjustment

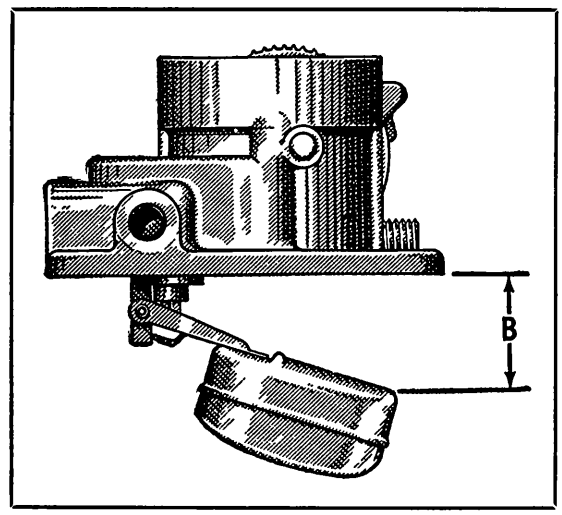

Figure 2
Float Drop

FLOAT ADJUSTMENT (Fig. 1)

With bowl cover assembly inverted and float resting on pin in seated needle and with gasket removed the distance (A) from the bowl cover to the top of float should be 9/32 inch (Gauge T109 126) Do not depress float lip against spring loaded pin in needle but let float rest of its own weight Adjust by bending lip of float not float arm Float setting must be checked with the bowl cover held at eye height in a level position

FLOAT DROP (Fig. 2)

With bowl cover assembly held in upright position the distance (B) between free end of float and bowl cover should be 1¼ inch Adjust by bending stop tabs on float arm

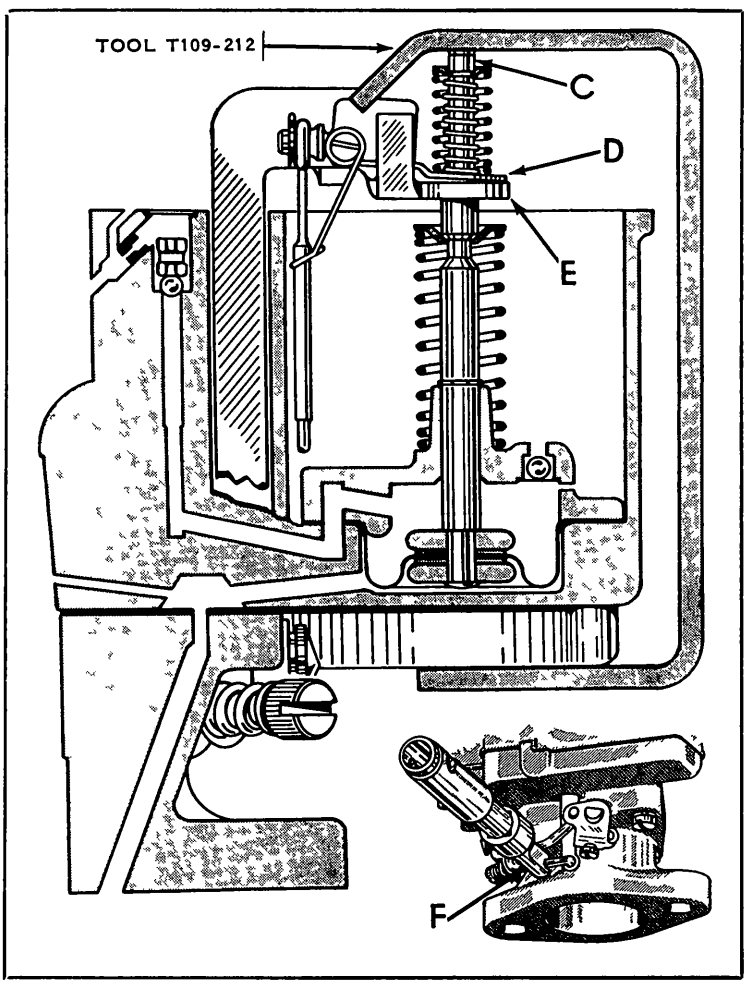

Figure 3
Pump Adjustm nt

PUMP ADJUSTMENT (Fig 3)

This adjustment should be made before the met ering rod adjustment and should be checked each time the carbureter is reassembled With throttle valve seated in the bore of carbureter press down on upper end of diaphragm shaft (C) until it reaches its bottom position (tool T109 212 may be used to hold diaphragm shaft down while checking pump adjustment) The metering rod arm (D) should now contact the pump lifter link (E) at the outer end nearest the springs Adjust by bending pump connector link (F) at its lower angle Use bending tool T109 213

CAUTION Bend connector rod only at its lower angle, as any other method may cause pump lifter link to bind

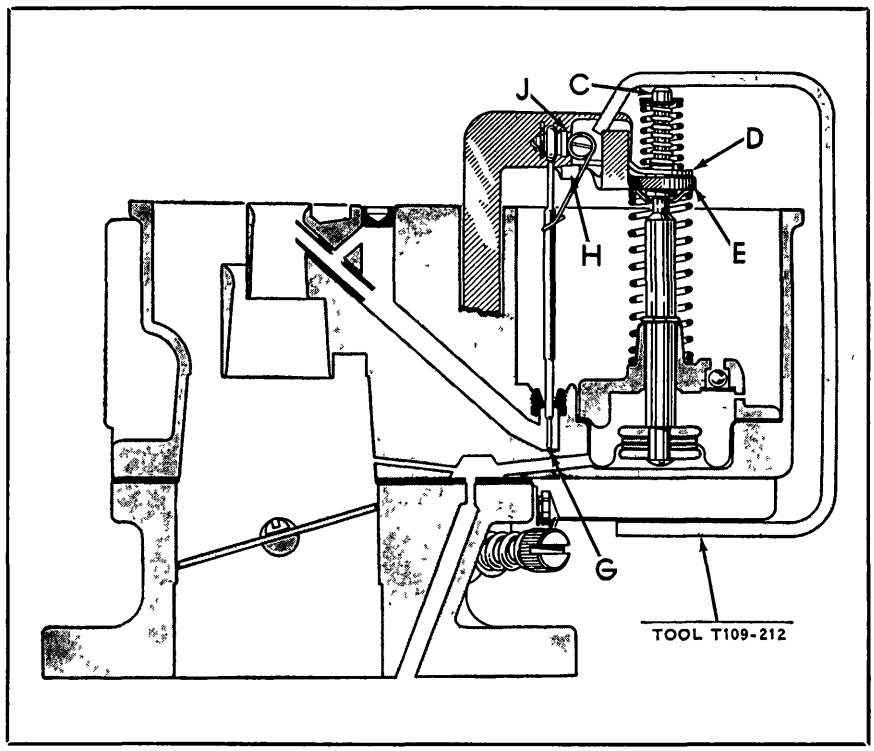

Figure 4
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 4):

This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed. With throttle valve seated in bore of carbureter, press down on upper end of diaphragm shaft (C) until diaphragm bottoms in vacuum chamber. Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod. Metering rod should contact bottom of metering rod well (G), and metering rod arm (D) should contact lifter link (E) between springs and at supporting lug (H). Adjust by bending lip (J) of metering rod arm to which metering rod is attached, up or down.

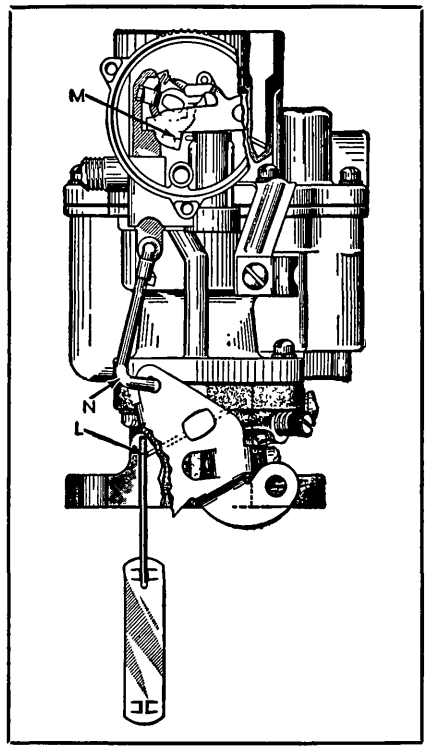

Figure 5
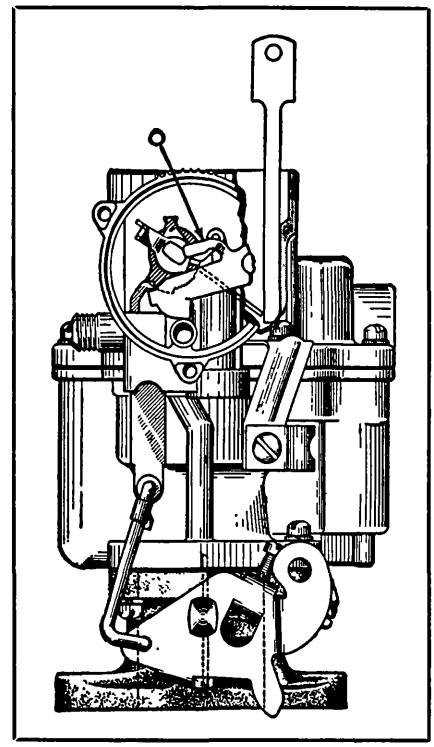
Fast Idle Adjustment



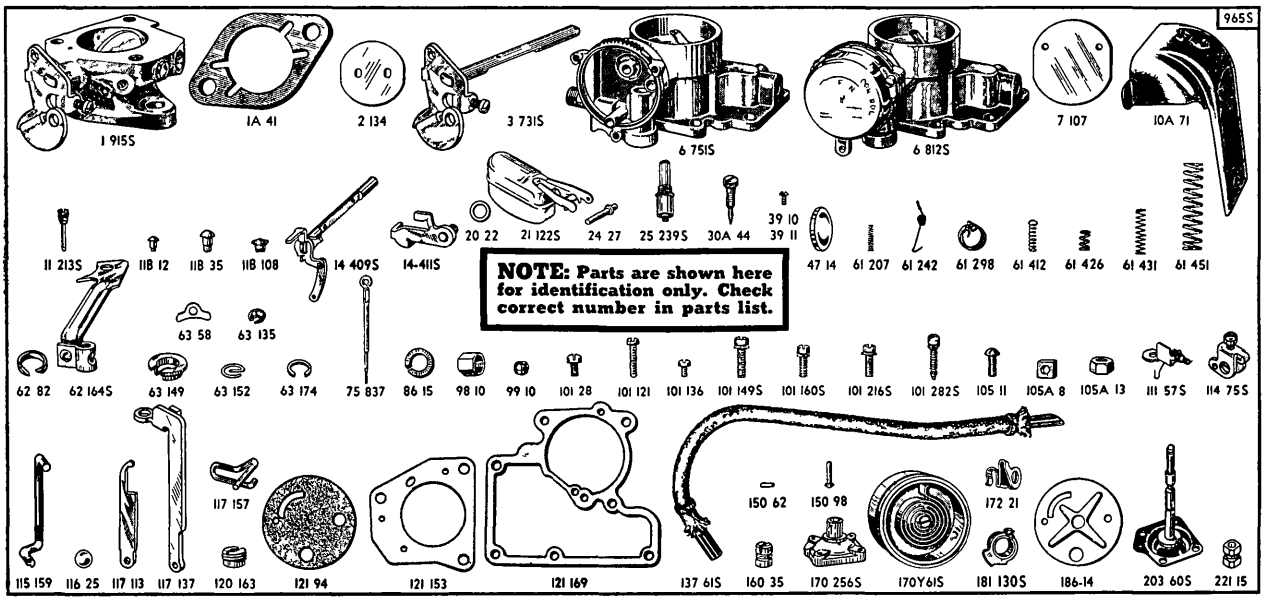


Figure 6
Unloader Adjustment

FAST IDLE ADJUSTMENT (Fig. 5):

Remove thermostatic coil housing, gasket and baffle plate. Crack throttle valve, and hold choke valve fully closed, then close throttle. This will allow fast idle cam (M) to revolve to fast idle position. With choke valve held tightly closed and slight tension on throttle lever, there should now be .067 inch clearance (L) (gauge T109-234) between throttle valve and bore of carbureter (side opposite idle port). Adjust by bending connector link at lower angle (N). Use bending tool T109-213.

UNLOADER ADJUSTMENT (Fig. 6):

This adjustment must be made after fast idle adjustment. Hold throttle valve in wide open position and close choke valve as far as possible without forcing. There should be 3/16 inch clearance between lower edge of choke valve and inner wall of air horn (gauge T109-28). Adjust by bending arm (O) of choke trip lever (Use tool T109-214).

CARBURETER ADJUSTMENTS

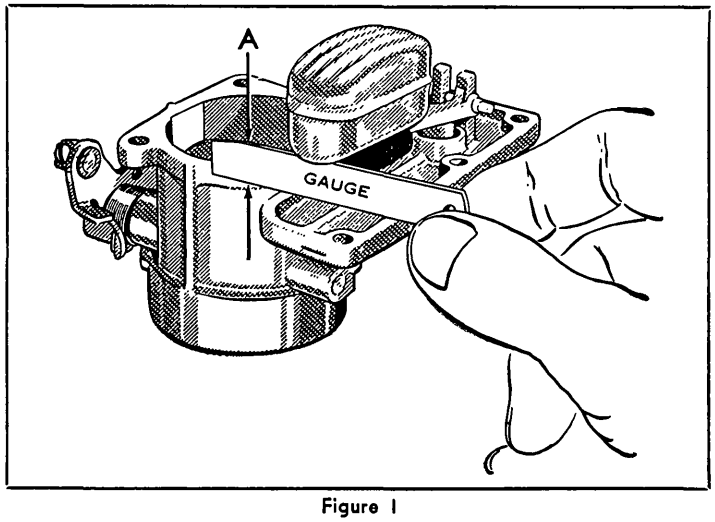

Figure 1
Float Adjustment

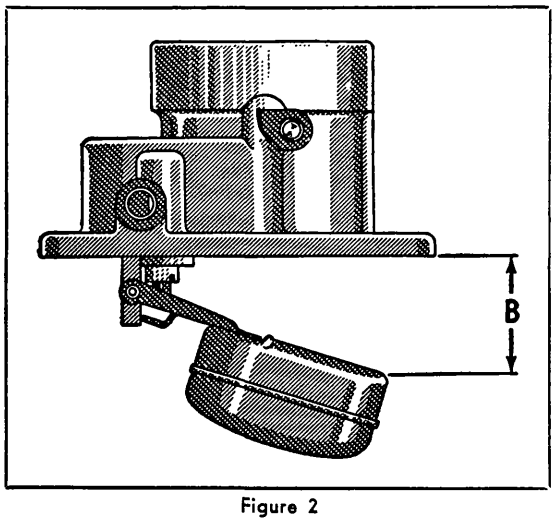

Figure 2
Float Drop

FLOAT ADJUSTMENT (Fig. 1):

With bowl cover assembly inverted and float resting on pin in seated needle, and with gasket removed, the distance (A) from the bowl cover to the top of float should be 9/32 inch (Gauge T109-126). Do not depress float lip against spring loaded pin in needle, but let float rest of its own weight. Adjust by bending lip of float, not float arm. Float setting must be checked with the bowl cover held at eye height in a level position.

FLOAT DROP (Fig. 2):

With bowl cover assembly held in upright position the distance (B) between free end of float and bowl cover should be 1¼ inch. Adjust by bending stop tabs on float arm.

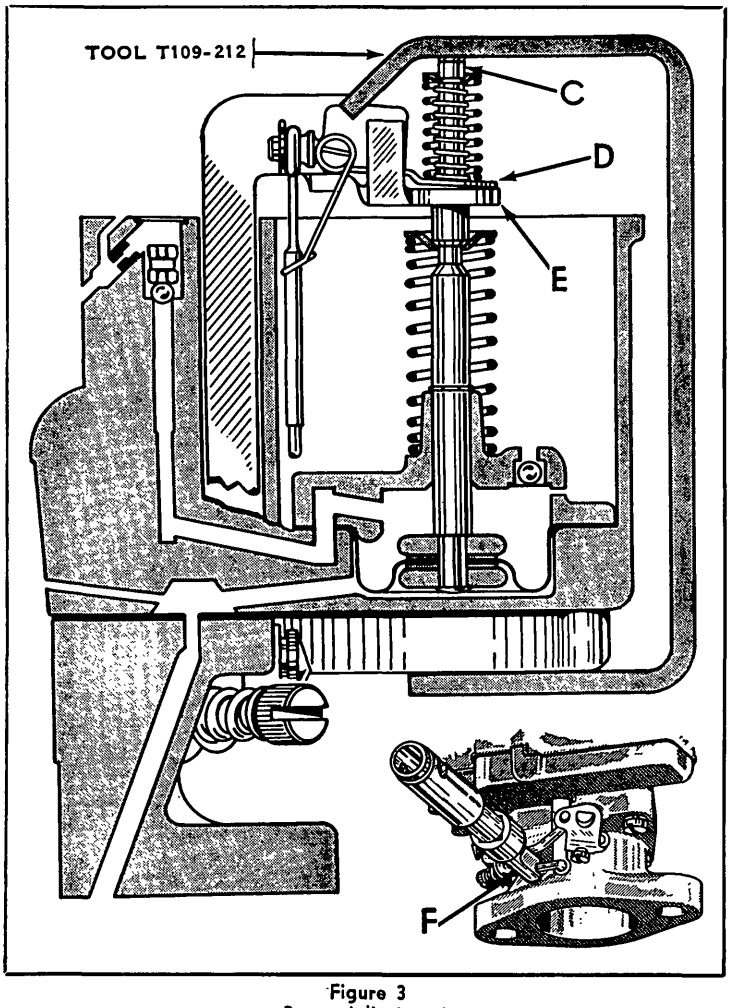

Figure 3
Pump Adjustment

PUMP ADJUSTMENT (Fig. 3):

This adjustment should be made before the metering rod adjustment and should be checked each time the carbureter is reassembled. With throttle valve seated in the bore of carbureter, press down on upper end of diaphragm shaft (C) until it reaches its bottom position (tool T109-212 may be used to hold diaphragm shaft down while checking pump adjustment). The metering rod arm (D) should now contact the pump lifter link (E) at the outer end nearest the springs. Adjust by bending pump connector link (F) at its lower angle. Use bending tool T109-213.

CAUTION: Bend connector rod only at its lower angle, as any other method may cause pump lifter link to bind.

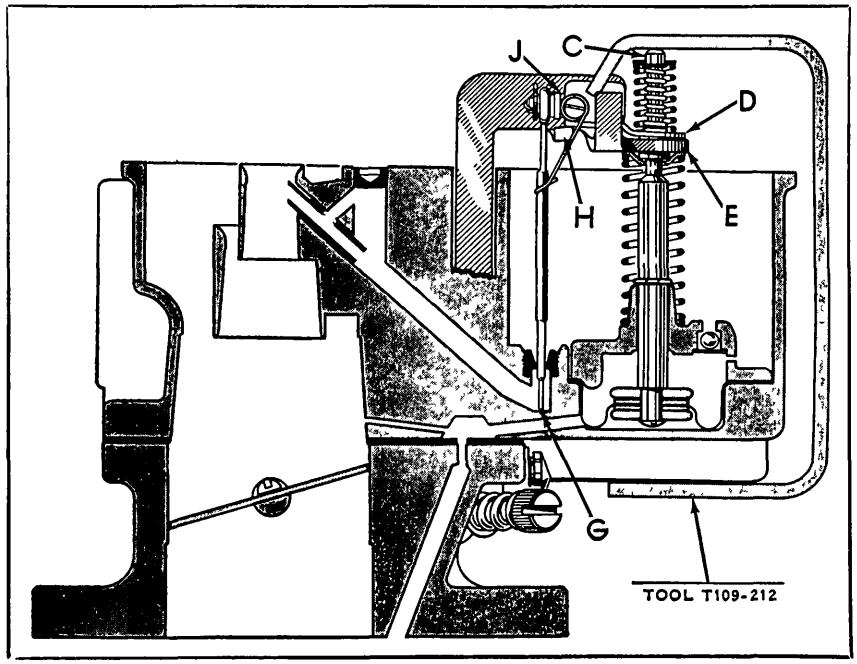

Figure 4
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 4):

This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed. With throttle valve seated in bore of carbureter, press down on upper end of diaphragm shaft (C) until diaphragm bottoms in vacuum chamber. Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod. Metering rod should contact bottom of metering rod well (G) and metering rod arm (D) should contact lifter link (E) at the outer end nearest the springs and at supporting lug (H). Adjust by bending lip (J) of metering rod arm to which metering rod is attached, up or down.

FAST IDLE ADJUSTMENT (Fig. 5):

With choke held in wide open position, lip (K) of fast idle arm should contact boss on body casting. Adjust by bending at offset portion (L) of choke connector link.

Float Setting See Adjustments

Vents Outside none Inside balance vent tube to a r horn above choke valve

Gasoline Intake Spring loaded needle Size No 46 (081 inch) drill in needle seat

Low Speed Jet Tube Jet size No 68 (031 inch) drill By pass (in body) size No 51 (067 inch) drill Economizer size No 54 (055 inch) drill

Idle Port Upper port slot type length 174 to 176 inch width 040 inch

Idle Port Opening Top of upper port 166 to 170 inch above top edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw) Size 0615 to 0655 inch diameter

Set Idle Adjustment Screw ¾ to 1¾ turns open For richer mixture turn screw out Do not idle engine below 420 RPM

Main Nozzle Nozzle is installed permanently DO NOT RE MOVE Anti percolator well bleed to bore size No 65 (035 inch) drill

Metering Rod Economy step 074 inch diameter
Middle step tapers to 058 inch diameter
Power step 047 inch diameter

Metering Rod Jet 098 inch diameter

Accelerating Pump Diaphragm type vacuum and mechanically operated
Pump jet size No 74 (0225 inch) dr ll
Intake ball check seat (in diaphragm housing) size No 40 (098 inch) drill
Discharge ball check seat (in body) size No 42 (0935 inch) drill
Pump bleed (in diaphragm housing) size No 70 (028 inch) drill
Vacuum restriction (in flange) size No 55 (052 inch) drill
Vacuum passage (diaphragm bleed) size No 65 (035 inch) drill

Pump Adjustment See Adjustments

Choke Manual interconnected with throttle Valve offset butterfly type

Vacuum Spark Port Slot type Size 125 by 041 inch Bottom of port 022 to 032 nch above top edge of valve with valve tightly closed

MOTOR TUNE-UP

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open When Steel Ball on Flywheel is in Line with Pointer	Valve Setting (Hot)	Float Setting	Idle Adjustment Screw Setting
040" (1937-48) 035" (1949 52)	018"		Intake 006" 008" Exhaust 013" 015"	9/32 Inch (Use Gauge T109 126)	¾ to 1¾ Turns Open

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: With bowl cover assembly inverted and float resting on pin in seated needle and with gasket removed, the distance from the bowl cover to the top of float should be 9/32' (Gauge T109-126) Do not depress float lip against spring loaded pin in needle, but let float rest of its own weight Adjust by bending lip of float, not float arm Float setting must be checked with the bowl cover held at eye height in a level position

FLOAT DROP With bowl cover assembly held in upright position the distance between free end of float and bowl cover should be 1¼' Adjust by bending stop tabs on float arm

PUMP ADJUSTMENT This adjustment should be made before the metering rod adjustment and should be checked each time the carbureter is reassembled With throttle valve seated in the bore of carbureter, press down on upper end of diaphragm shaft until it reaches its bottom position (tool T109-212 may be used to hold diaphragm shaft down while checking pump adjustment) The metering rod arm should now contact the pump lifter link at the outer end nearest the springs Adjust by bending pump connector link at its lower angle Use bending tool T109 213

CAUTION Bend connector rod only at its lower angle as any other method may cause pump lifter link to bind

METERING ROD ADJUSTMENT This adjustment is important and should be checked each time the carbureter is reassembled or leaner rods are installed With throttle valve seated in bore of carbureter press down on upper end of diaphragm shaft until diaphragm bottoms in vacuum chamber (tool T109 212 may be used to hold diaphragm shaft down while adjusting metering rod) Metering rod should contact bottom of metering rod well and metering rod arm should contact lifter link at the outer end nearest the springs and at supporting lug Adjust by bending lip of metering rod arm to which metering rod is attached up or down

FAST IDLE ADJUSTMENT With choke held in wide open position lip of fast idle arm should contact boss on body casting Adjust by bending at offset portion of choke connector rod

(1½ Inch Flange)
Manual Choke

Casting No. 788 on face of flange.

CHEVROLET POWER GLIDE AND TRUCK 1950-1952

YF DOWN-DRAFT **CARBURETER No. 966S**

CARBURETER SPECIFICATIONS

For Chevrolet 6 Cylinder Engine: 3-9/16 Inch Bore, 3-15/16 Inch Stroke

Dimensions: Flange size, 1½ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1-5/16 inch I. D.

Float Setting: See adjustments.

Vents: Outside, none. Inside balance vent to air horn above choke valve.

Gasoline Intake: Spring loaded needle. Size No. 46 (.081 inch) drill in needle seat.

Low Speed Jet Tube: Jet size No. 67 (.032 inch) drill. By-pass in body, size No. 52 (.0635 inch) drill. Economizer size No. 55 (.052 inch) drill.

Idle Port: Upper port: slot type, length .189 to .191 inch; width .040 inch.

Idle Port Opening: Top of port .153 to .157 inch above top edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. Do not idle engine below 450 RPM.

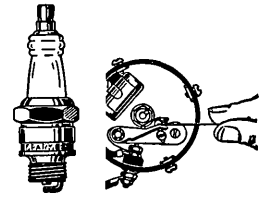
Main Nozzle: Nozzle is installed permanently. DO NOT REMOVE. Anti-percolator: Drilled passage from anti-percolator well to nozzle.

Metering Rod: Economy step .073 inch diameter; middl step tapers to .059 inch diameter; power step .050 inch diameter.

Metering Rod Jet: .1015 inch diameter.

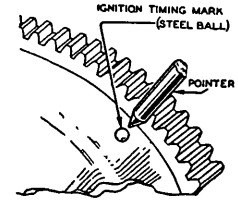
Metering Rod Setting: See adjustments.

Accelerating Pump: Diaphragm type vacuum and mechanically operated. Pump jet size No. 72 (.025 inch) drill. Intake, ball check seat (in diaphragm housing) size No. 40 (.098 inch) drill. Discharge ball check seat (in body) size No. 42 (.0935 inch) drill. Pump bleed (in diaphragm housing) size No. 73 (.024 inch) drill. Vacuum restriction (in flange) size No. 55 (.052 inch) drill. Vacuum passage (diaphragm bleed) size No. 65 (.035 inch) drill.



Pump Adjustment: See adjustments.

Choke: Manual, interconnected with throttle. Valve, offset butterfly type.



Vacuum Spark Port: Horizontal slot type, size .125 by .041 inch. Top of port (early prod.) .025 to .035 inch; (late prod.) .035 to .045 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carburet r.

CARBURETER ADJUSTMENTS

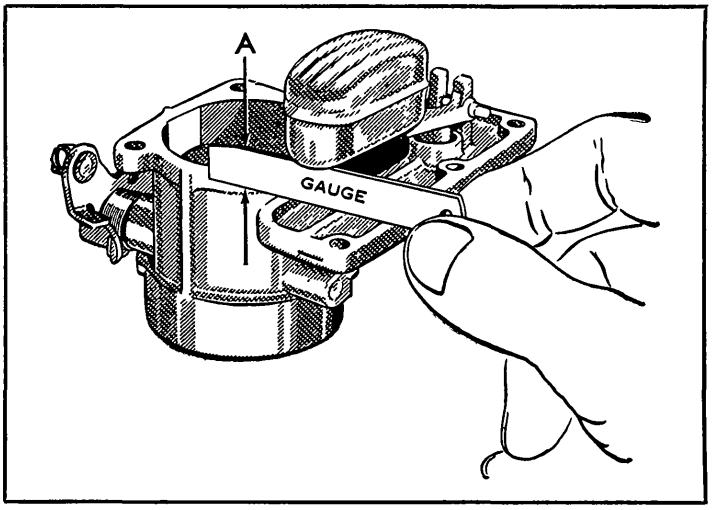

Figure 1
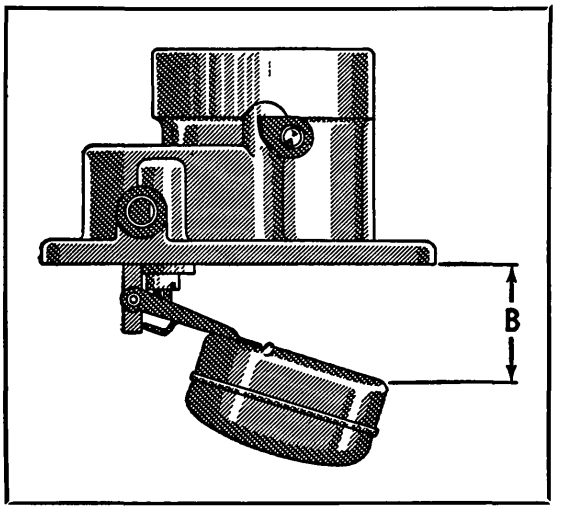
Float Adjustment



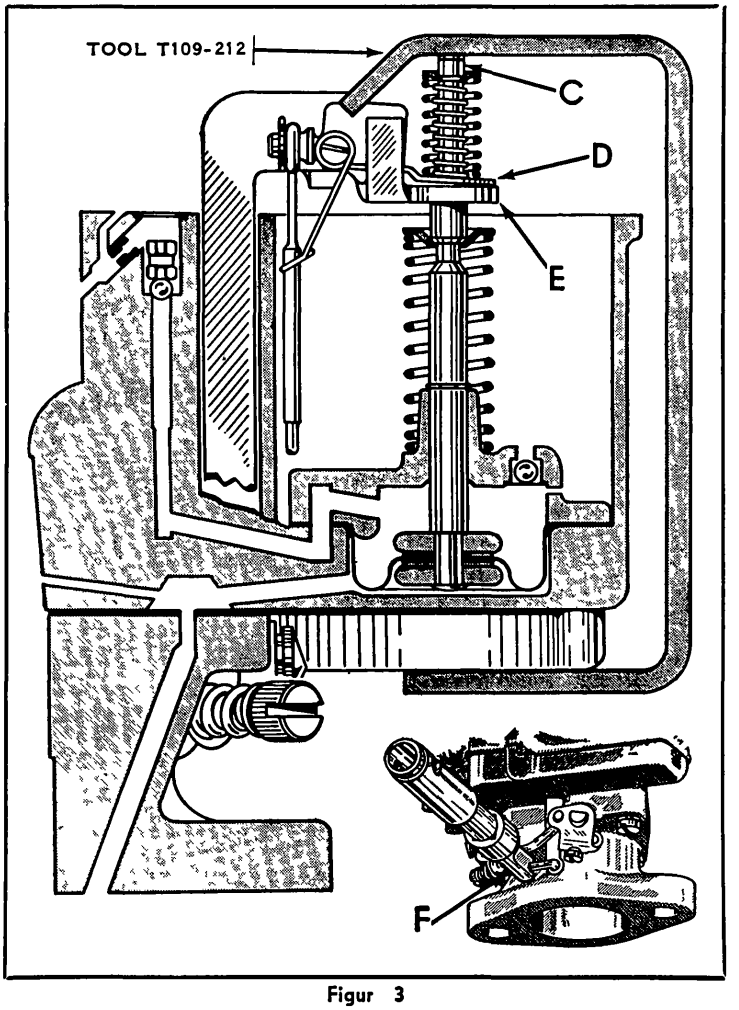


Figure 2
Float Drop

FLOAT ADJUSTMENT (Fig. 1):

With bowl cover assembly inverted and float resting on pin in seated needle, and with gasket removed, the distance (A) from the bowl cover to the top of float should be 9/32 inch (Gauge T109-126). Do not depress float lip against spring loaded pin in needle, but let float rest of its own weight. Adjust by bending lip of float, not float arm. Float setting must be checked with the bowl cover held at eye height in a level position.

FLOAT DROP (Fig. 2):

With bowl cover assembly held in upright position the distance (B) between free end of float and bowl cover should be 1¼ inch. Adjust by bending stop tabs on float arm.

Figur 3
Pump Adjustment

PUMP ADJUSTMENT (Fig. 3):

This adjustment should be made before the metering rod adjustment and should be checked each time the carbureter is reassembled. With throttle valve seated in the bore of carbureter, press down on upper end of diaphragm shaft (C) until it reaches its bottom position (tool T109-212 may be used to hold diaphragm shaft down while checking pump adjustment). The metering rod arm (D) should now contact the pump lifter link (E) at the outer end nearest the springs. Adjust by bending pump connector link (F) at its lower angle. Use bending tool T109-213

CAUTION: Bend connector rod only at its lower angle, as any other method may cause pump lifter link to bind.

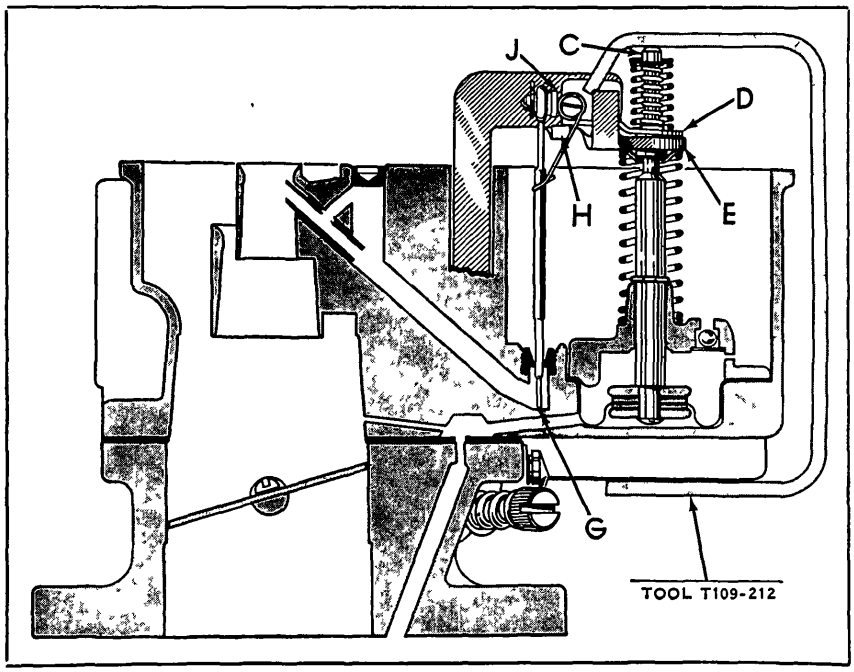

Figure 4
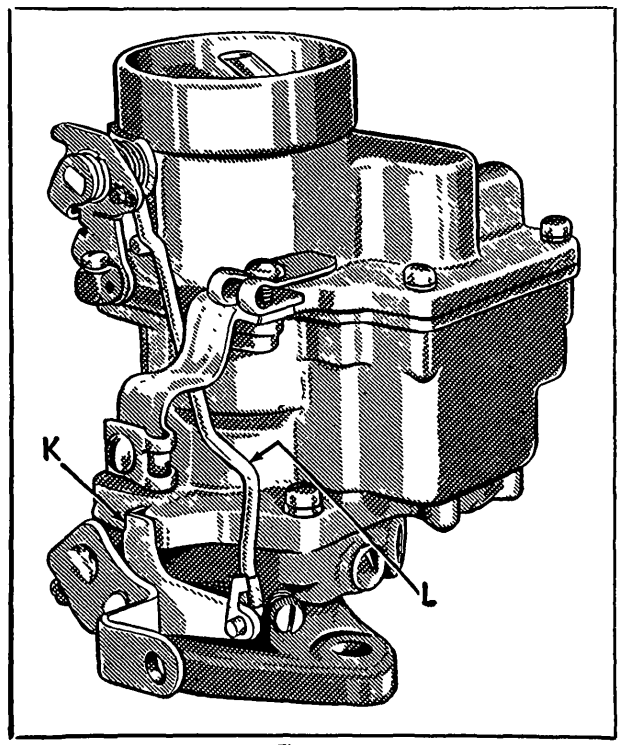
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 4):

This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed. With throttle valve seated in bore of carbureter, press down on upper end of diaphragm shaft (C) until diaphragm bottoms in vacuum chamber. Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod. Metering rod should contact bottom of metering rod well (G) and metering rod arm (D) should contact lifter link (E) at the outer end nearest the springs and at supporting lug (H). Adjust by bending lip (J) of metering rod arm to which metering rod is attached, up or down.

FAST IDLE ADJUSTMENT (Fig. 5):

With choke held in wide open position, lip (K) of fast idle arm should contact boss on body casting. Adjust by bending at offset portion (L) of choke connector link.



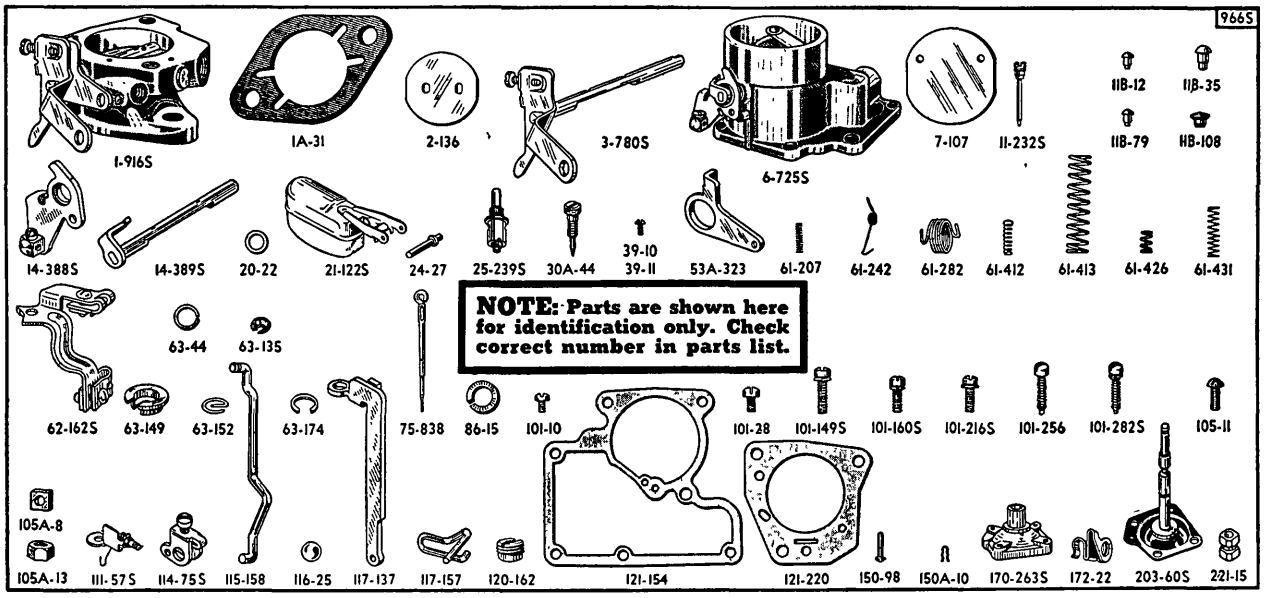


Figure 5
Fast Idle Adjustment

NOTE: Figures in parentheses indicate number of pieces used in ne carbureter. Where n figure is sh wn, nly n is used.

CARTER CARBURETOR
DIVISION OF acf INDUSTRIES INCORPORATED
ST. LOUIS, MO., U. S. A.

CHEVROLET 967S
June, 1953
Revised April, 1955

(1½ Inch Flange)

Casting No. 791 on face of flange.

CHEVROLET
POWER GLIDE & TRUCK 1950-1952

YF DOWN-DRAFT CLIMATIC® CONTROL **CARBURETER No. 967S**

CARBURETER SPECIFICATIONS

Chevrolet 6 Cylinder Engine: 3-9/16 Inch Bore, 3-15/16 Inch Stroke

Dimensions: Flange size, 1½ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1-5/16 inch I. D.

Float Setting: See adjustments.

Vents: Outside, none. Inside balance vent to air horn above choke valve.

Gasoline Intake: Spring loaded needle. Size No. 46 (.081 inch) drill in needle seat.

Low Speed Jet Tube: Jet size No. 67 (.032 inch) drill. By-pass in body, size No. 52 (.0635 inch) drill. Economizer, size No. 55 (.052 inch) drill.

Idle Port: Upper port: slot type, length .190 inch, width .040 inch.

Idle Port Opening: Top of port .143 to .147 inch above top edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: 1 to 2 turns open. For richer mixture, turn screw out. Idle engine between 430-450 r.p.m. (Transmission in neutral).

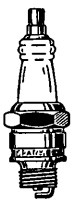
Main Nozzle: Nozzle is installed permanently. DO NOT REMOVE. Anti-percolator; Drilled passage from anti-percolator well to nozzle.

Metering Rod: Economy step .073 inch diameter; middle step tapers to .059 inch diameter; power step .050 inch diameter

Metering Rod Jet: .1015 inch diameter.

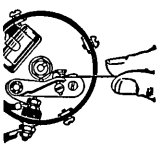
Metering Rod Setting: See adjustments.

Accelerating Pump: Diaphragm type, vacuum and mechanically operated. Pump jet, size No. 72 (.025 inch) drill. Intake ball check seat (in diaphragm housing), size No. 40 (.098 inch) drill. Discharge ball check seat (in body), size No. 42 (.0935 inch) drill. Pump bleed (in diaphragm housing), size No. 73 (.024 inch) drill. Vacuum restriction (in flange), size No. 55 (.052 inch) drill. Vacuum passage (diaphragm bleed), size No. 65 (.035 inch) drill.



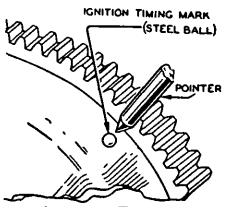
Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control, set one point rich. Offset, butterfly type. Choke heat suction hole in body, size No. 36 (.1065 inch) drill.

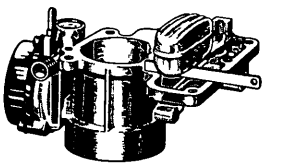


Vacuum Spark Port: Horizontal slot type, size .125 by .041 inch. Top of port (early prod.) .025 to .035 inch; (late prod.) .035 to .045 inch above top edge of valve with valve tightly closed.

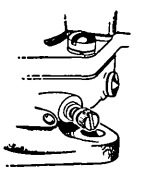
Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting .018"

Ignition Timing Breaker Points to Open: When Steel Ball on Flywheel is in Line with Pointer

Float Setting 9/32 Inch (Use Gauge T109-126)

Idle Adjustment Screw Setting 1 to 2 Turns Open

NOTE: These cars equipped with Hydraulic Valve Lifters. No adjustment.

CARBURETER ADJUSTMENTS

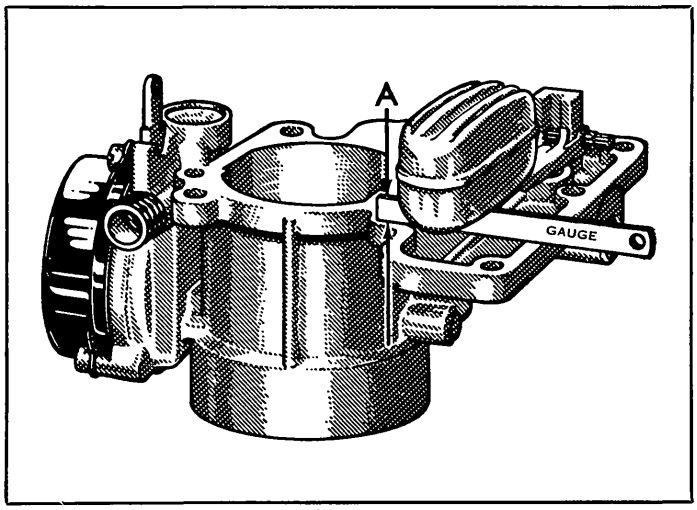

Figure 1
Float Adjustment

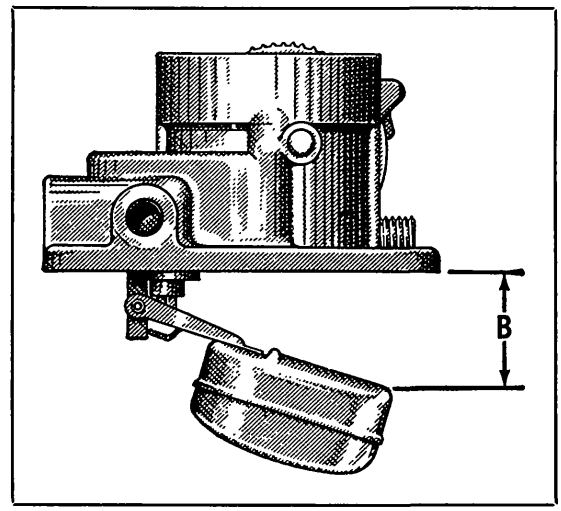

Figure 2
Float Drop

FLOAT ADJUSTMENT (Fig. 1):
With bowl cover assembly inverted and float resting on pin in seated needle, and with gasket removed, the distance (A) from the bowl cover to the top of float should be 9/32" (Gauge T109-126). Do not depress float lip against spring loaded pin in needle, but let float rest of its own weight. Adjust by bending lip of float, not float arm. Float setting must be checked with the bowl cover held at eye height in a level position.

FLOAT DROP (Fig. 2):
With bowl cover assembly held in upright position the distance (B) between free end of float and bowl cover should be 1¼". Adjust by bending stop tabs on float arm.

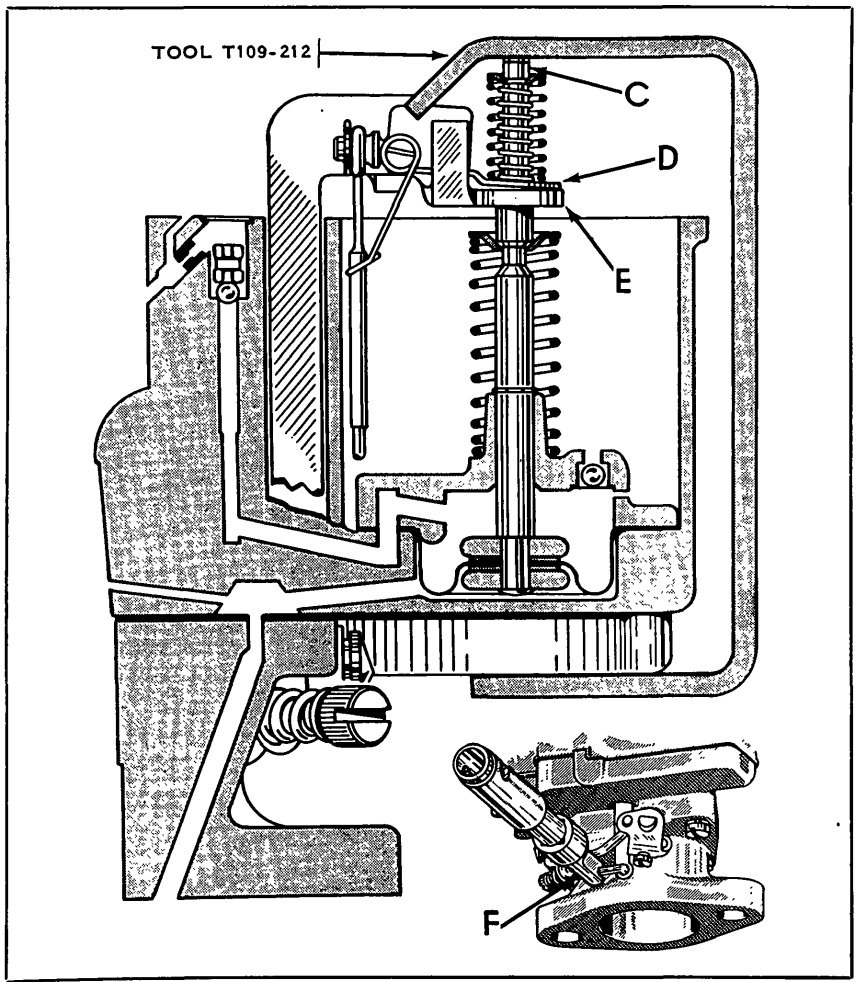

Figure 3
Pump Adjustment

PUMP ADJUSTMENT (Fig. 3):
This adjustment should be made before the metering rod adjustment and should be checked each time the carbureter is reassembled. With throttle valve seated in the bore of carbureter, press down on upper end of diaphragm shaft (C) until it reaches its bottom position (tool T109-212 may be used to hold diaphragm shaft down while checking pump adjustment). The metering rod arm (D) should now contact the pump lifter link (E) at the outer end nearest the springs. Adjust by bending pump connector link (F) at its lower angle (see illustration). Use bending tool T109-213.

CAUTION: Bend connector rod only at its lower angle with tool in position shown, as any other method may cause pump lifter link to bind.

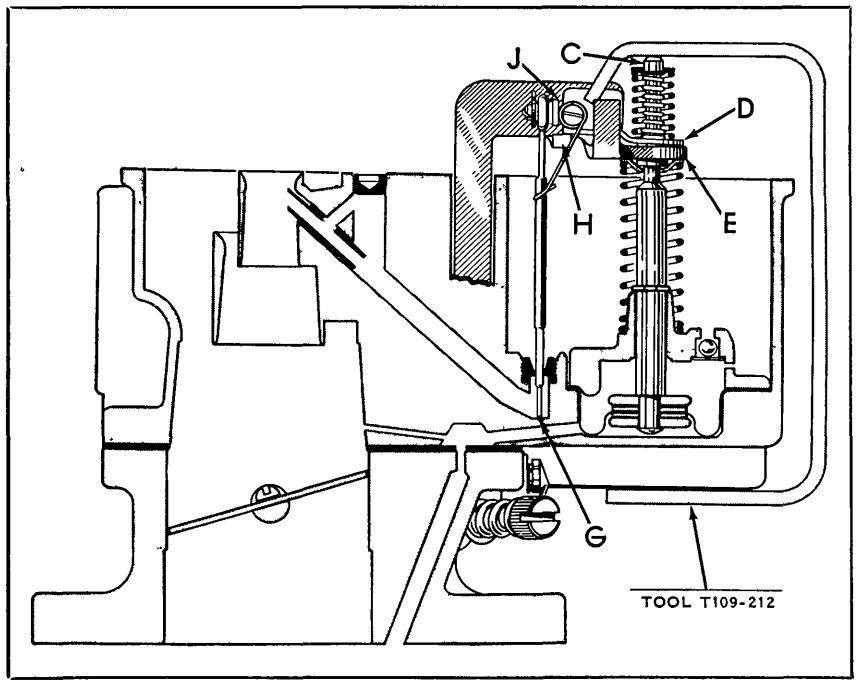

Figure 4
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 4):

This adjustment is important and should be checked each time the carbureter is reassembled or lean rods installed. With throttle valve seated in bore of carbureter, press down on upper end of diaphragm shaft (C) until diaphragm bottoms in vacuum chamber. Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod Metering rod should contact bottom of metering rod well (G) and metering rod arm (D) should contact lifter link (E) between springs and at supporting lug (H). Adjust by bending lip (J) of metering rod arm to which metering rod is attached, up or down.

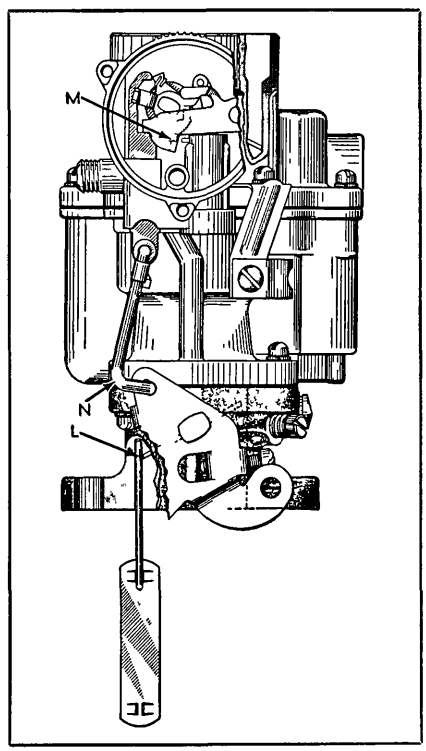

Figure 5
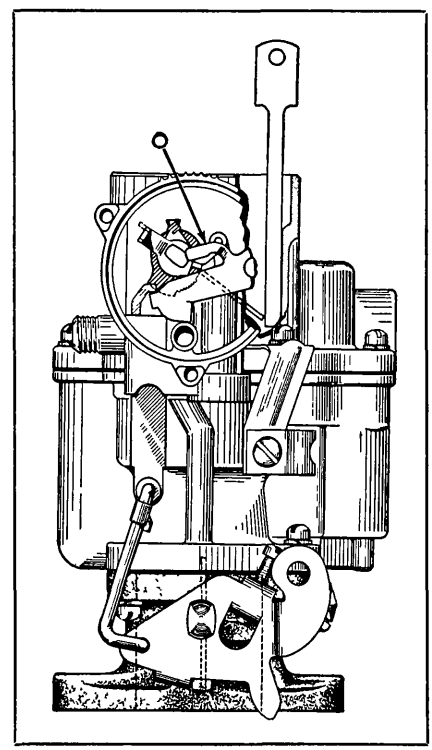
Fast Idle Adjustment



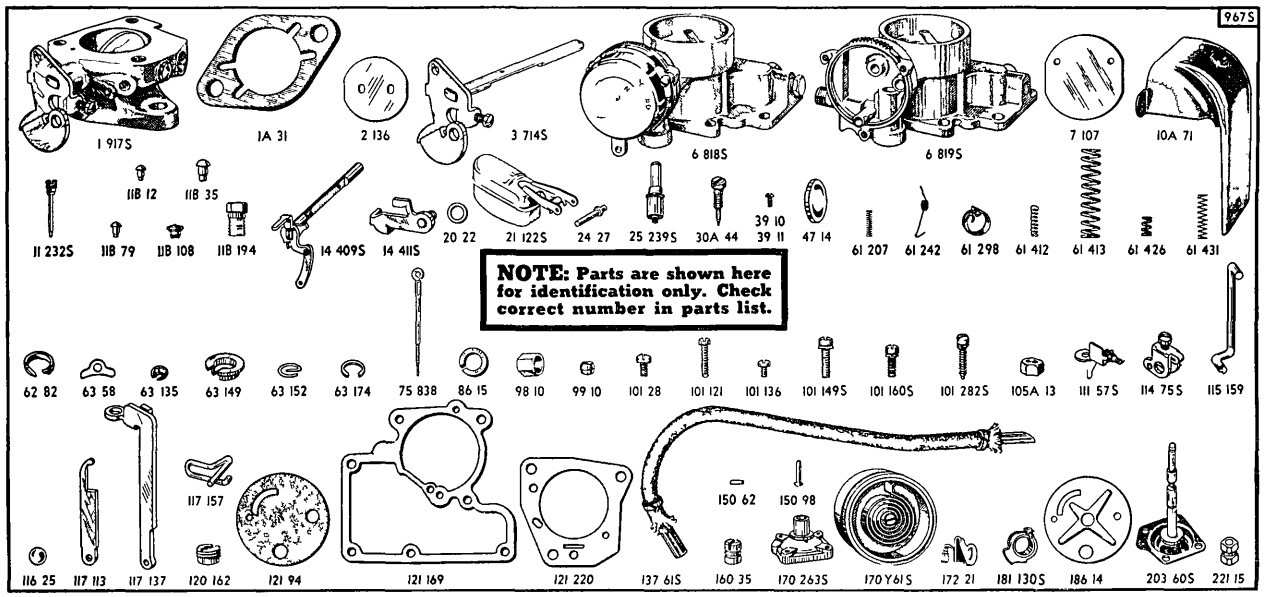


Figure 6
Unloader Adjustment

FAST IDLE ADJUSTMENT (Fig 5):

Remove thermostatic coil housing, gasket and baffle plate Crack throttle valve, and hold choke valve fully closed, then close throttle This will allow fast idle cam (M) to revolve to fast idle position. With choke valve held tightly closed and slight tension on throttle lever, there should now be .080 inch clearance (L) (Gauge T109-234) between throttle valve and bore of carbureter (side opposite idle port). Adjust by bending connector link at lower angle (N). Use bending tool T109-213.

UNLOADER ADJUSTMENT (Fig. 6):

This adjustment must be made after fast idle adjustment Hold throttle valve in wide open position and close choke valve as far as possible without forcing. There should be 3/16 inch clearance (Gauge T109-28) between lower edge of choke valve and inner wall of air horn. Adjust by bending arm (O) of choke trip lever (Use tool T109-214).

GENERAL BULLETIN

ALL CARBURETER ACCOUNTS

BULLETIN NO. 50 Chevrolet
DATE May 20, 1959

SUBJECT: 1959 CHEVROLET V8 283 & 348 CU. IN. ENGINES

NEW PRIMARY FLOAT ASSEMBLY 21-200S USED IN WCFB-2816S 2817S AND 2818S FOUR BORE CARBURETERS

21-200S

A new primary float assembly Carter part No. 21-200S recently went into production on these carbureters. The new floats have baffle tabs attached to the float arms which slow down the washing action of fuel in the bowl when the car is operated through severe left and right turns. The action of the baffle assures an adequate supply of fuel to cover both primary metering rod jets while going through the turn. The new float (21-200S) is completely interchangeable with the early production float part 21-198S and the float used on 1958 production part 21-143S.

The 21-200S floats may be helpful in eliminating turn complaints on other applications of the WCFB type carbureter.

The float level adjustment does not change when the new floats are used.

Carbureters that have had the new floats installed in production are code dated "D9" (April 1959) or later, also the identification tags will be colored as follows: 2816S Blue, 2817S Orange, 2818S Green.

Correct float level adjustment is important. Other factors that can contribute to a turn complaint are: Misaligned floats, nicked or dented gasket surfaces surrounding the bores or around the vacumeter cylinder. Check to be sure the choke vacuum passage bushing part 145-142 (General Bulletin 497) is in place in the body casting. Use a new bowl cover gasket and tighten the inner bowl cover screws (around the bores) first before final tightening of the outer screws.

The Chevrolet part number for Carter 21-200S is 3770179. The list price is $2.50. A limited initial stock shipment is being made to Central Distributors. Carter warranty is not involved.

WCFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2218S**

CARBURETER SPECIFICATIONS

For Chevrolet 8 Cylinder Engine: 3¾ Inch Bore, 3 Inch Stroke

Dimensions: Flange size, 1⅛ inch. Four Bore—4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi (primary) size, 1-1/16 inch.
Main venturi (secondary) size, 15/16 inch I. D.

Float Level: See adjustments.

Vents: Outside, none. Inside, (2) on primary side, (3) on secondary side.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: (Primary side only).
Jet, size No. 68 (.031 inch) drill.
By-Pass, in body, size No. 52 (.0635 inch) drill.
Economizer, in screw plug, size (.049 inch) diameter.
Idle Bleed, in body, size No. 52 (.0635 inch) drill.

Idle Port: (Upper) slot type. Primary, length .174 inch; width .040 inch. Secondary, none.

Idle Port Opening: Primary, .113 to .119 inch above top edge of valve with valve tightly closed. Secondary, none.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill. Secondary, none

Set Idle Adjustment Screw: ¼ to 1¼ turns open. For richer mixture turn screw out Do not idle engine below 400 r.p.m. (Automatic Transmission—in Drive Range), 450 r.p.m. (Standard and Overdrive Transmission).

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating jet (primary, in plug) size No. 60 (.040 inch) drill, (secondary, in body) size No. 60 (.040 inch) drill.

Metering Rod: Primary, economy step .071 inch diameter. Middle step tapers to .065 inch diameter. Power step, .055 inch diameter. Secondary, none.

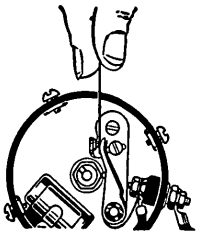
Metering Rod Jet: Primary, size .091 inch diameter (for metering rod).
Secondary, size .0512 inch diameter (no metering rod).

Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 73 (.024 inch) drill.
Intake ball check seat, size .115 to .120 inch diameter.
Discharge needle seat, size .070 inch diameter.

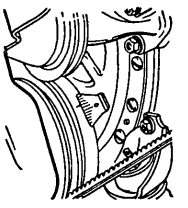
Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control, set 2 points lean. Butterfly type—offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 43 (.089 inch) drill.



Vacuum Spark Port: Horizontal slot (round end) .045 x .110 inch. Top of port (early production) .018 to .028 inch, (late production) .023 to .033 inch above valve with valve tightly closed.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

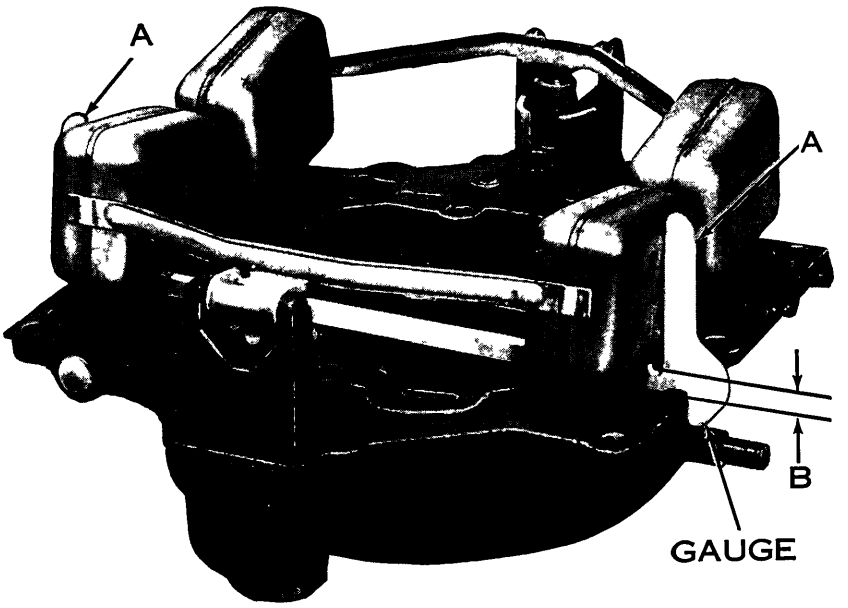

Figure 1
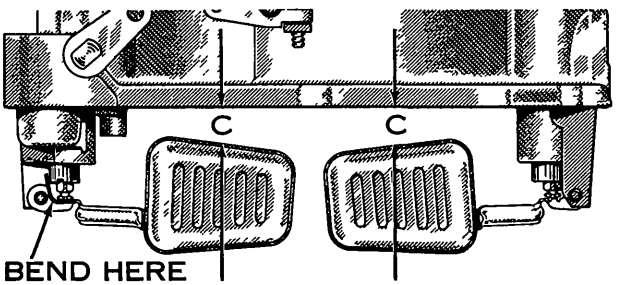
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

Two separate float adjustments must be made—lateral and vertical

LATERAL ADJUSTMENT With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge (A) Adjustment should be made by bending arms of floats

VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge Vertical distance (B) between top of float and machined surface of casting must be 1/8 inch (gauge T109 232) for primary floats and 1/4 inch (gauge T109 223) for secondary floats Adjust by bending float arms



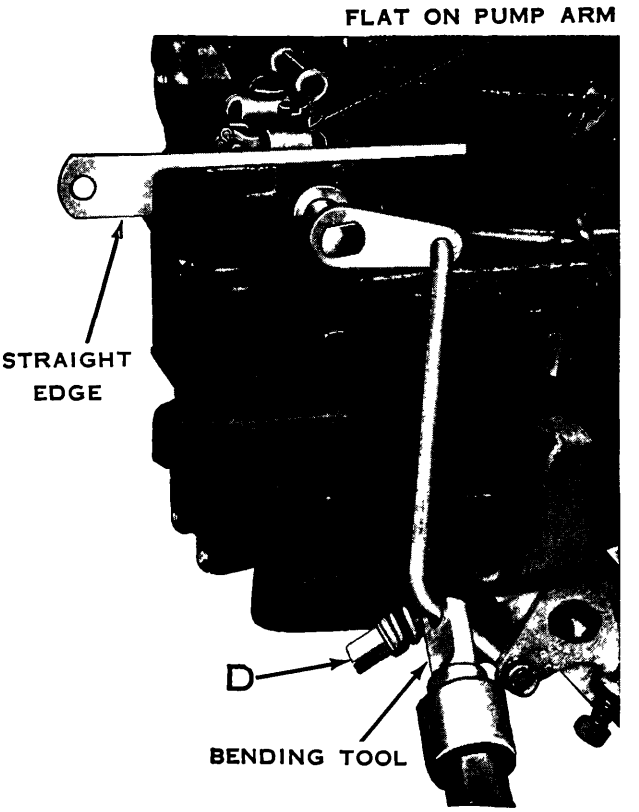


Figure 2
Float Drop Adjustment

FLOAT DROP ADJUSTMENT (Fig 2)

With bowl cover held in upright position and measuring from center of float the distance between top of floats (C) and bowl cover should be 5/8 inch for primary floats and 3/4 inch for secondary floats Adjust by bending stop tabs on float brackets

PUMP ADJUSTMENT (Fig. 3)

Install pump connector link in outer hole (long stroke) of pump arm with ends extending toward countershaft arm Back out throttle lever stop screw (D) until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109 213)

Figur 3
Pump Adjustment

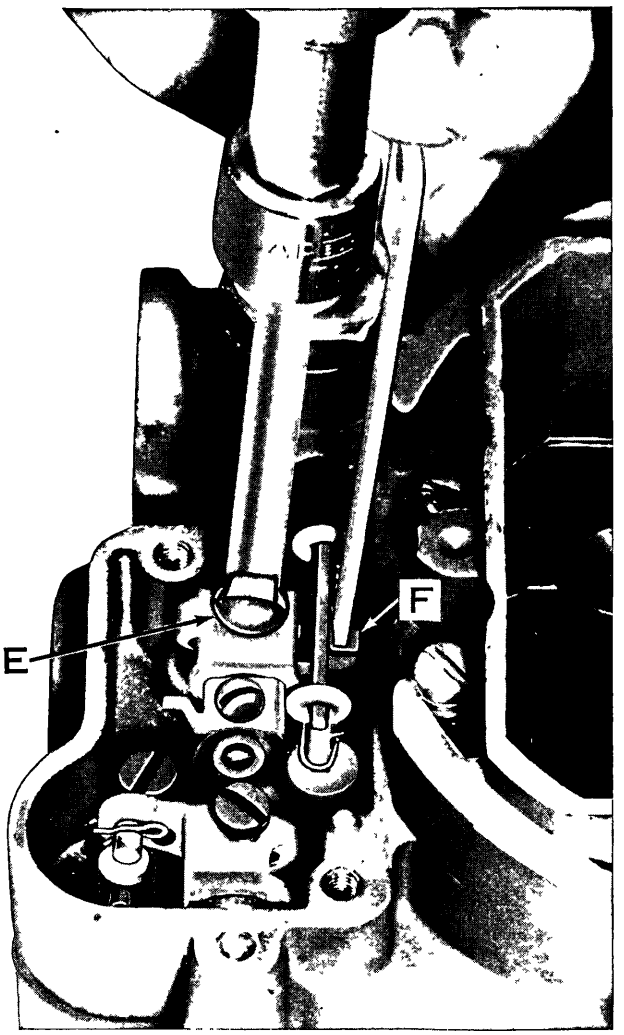

Figure 4
Metering Rod Adjustment

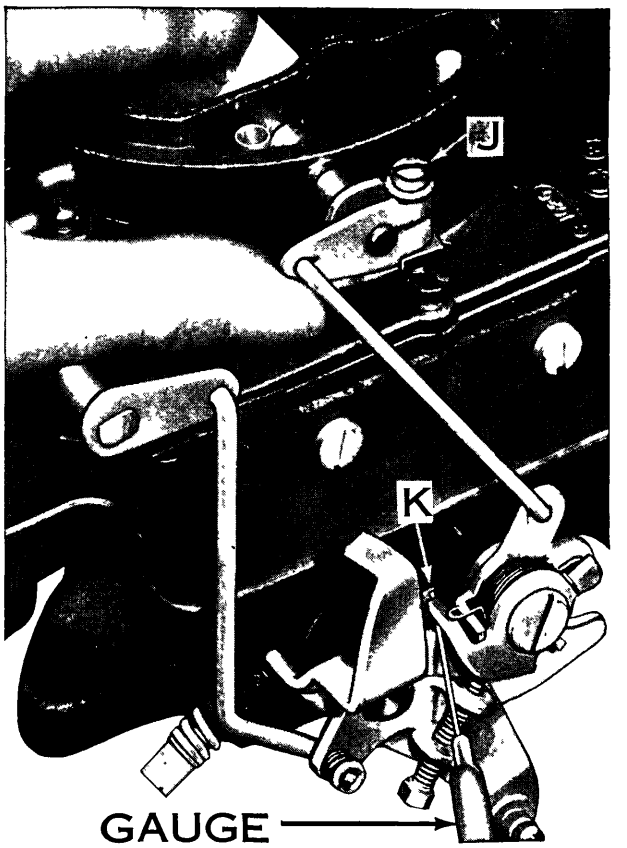

Figure 5A
Fast Idle Adjustment

METERING ROD ADJUSTMENT (Fig. 4):

Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (E). 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carburetor body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link (F). Hold in place and carefully tighten clamp screw (E).

FAST IDLE ADJUSTMENT (Fig. 5A and 5B):

(a) Loosen choke lever clamp screw (J) on choke shaft. Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting (K). Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (J). (b) With choke valve tightly closed tighten fast idle adjusting screw (L) until there is .015 inch (gauge T109-44) opening between throttle valve and bore of carbureter side opposite idle port. Be sure fast idle adjusting screw (L) is on high step of cam while making this adjustment.

MARCA REGISTRADA

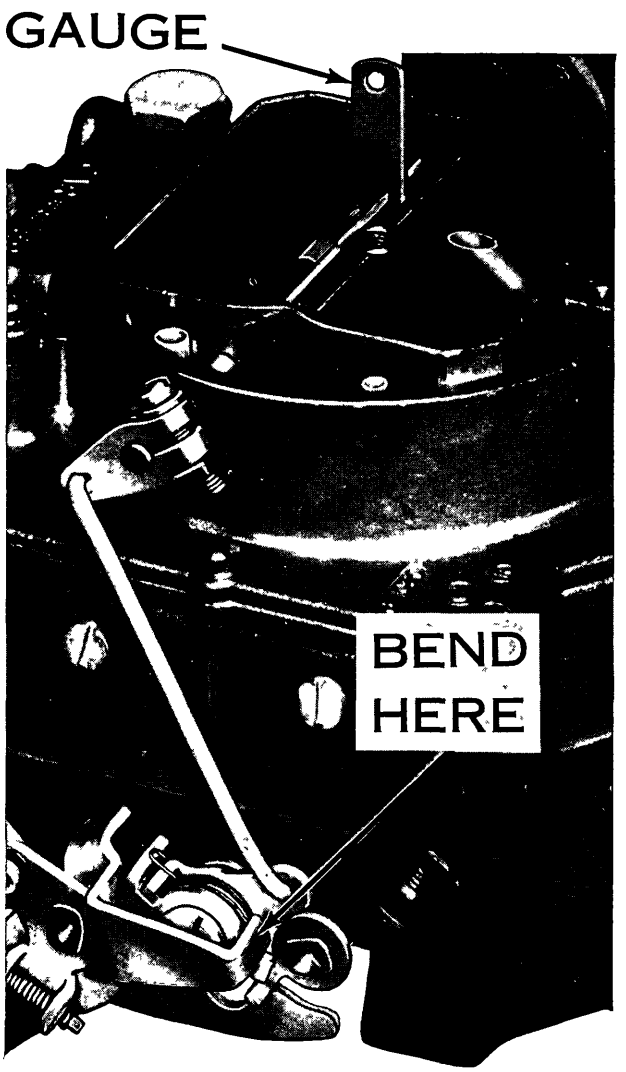

Figure 6
Unloader Adjustment

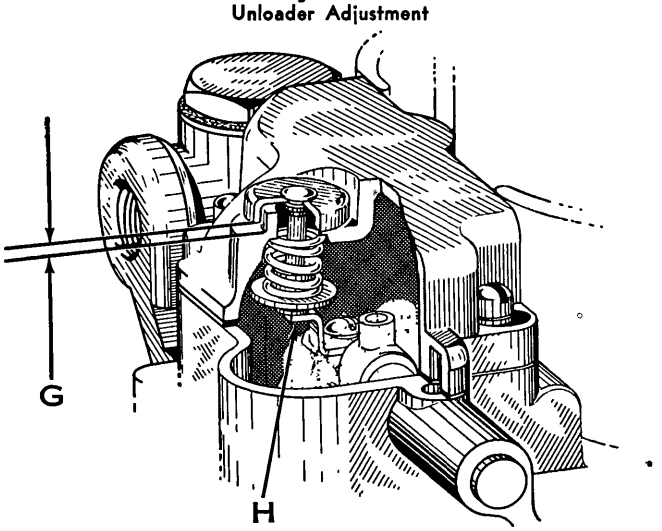

Figure 7
Bowl Vapor Vent Adjustment

BOWL VAPOR VENT ADJUSTMENT (Fig. 7):
This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever stop screw to allow throttle valves to seat in bores of carburetor. There should be 1/16 inch (G) (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm (H).

UNLOADER ADJUSTMENT (Fig. 6):
With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

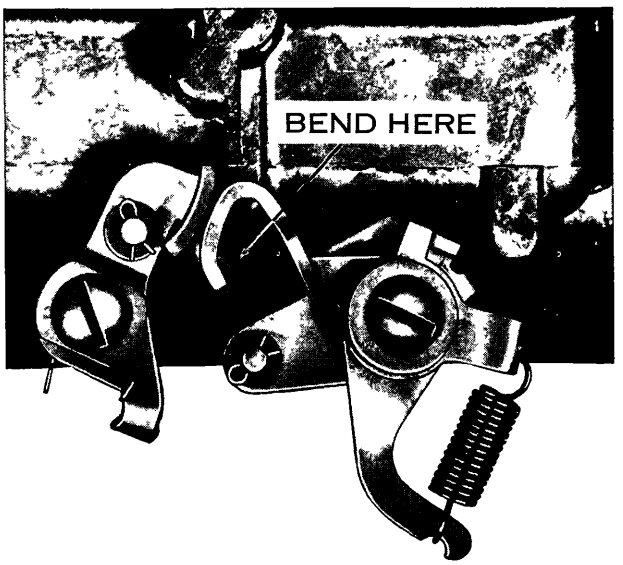

Figure 8
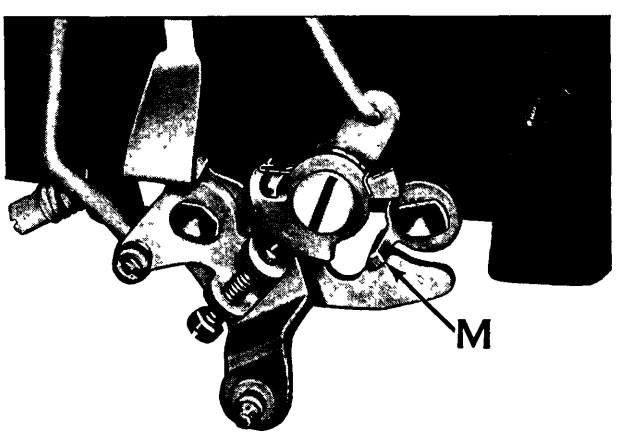
Secondary Throttle Lever Adjustment

SECONDARY THROTTLE LEVER ADJUSTMENT (Fig. 8):
Primary and secondary throttle valves should reach wide open position at the same time. To adjust, bend throttl operating rod at upper angle. (Use bending tool T109-213.)



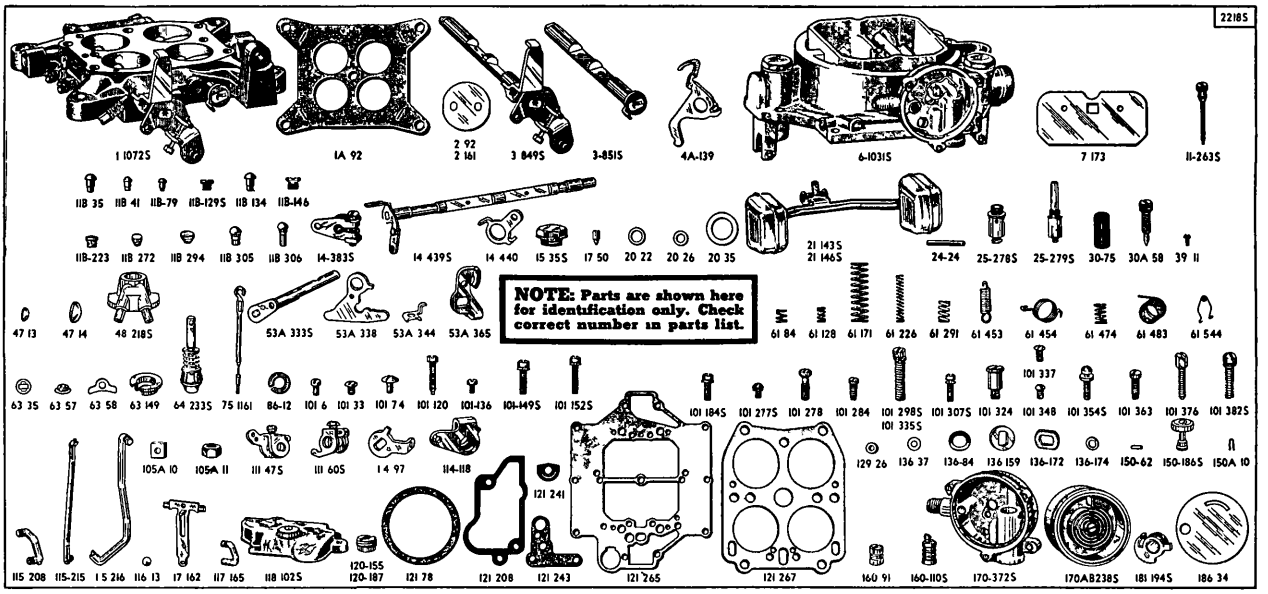


Figure 9
Secondary Throttle Lock-Out Adjustment

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 9):
This adjustment should be made after completing fast idle and secondary throttle lever adjustments. Crack throttle valves and manually open and close the choke valve. Tang (M) on secondary throttle lever should freely engage in notch of lock-out dog. If necessary to adjust, bend tang (M) on secondary throttle lever.

(2419S) **Front Carbureter**

WCFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2362S-2419S**

CARBURETER SPECIFICATIONS

For Chevrolet 8 Cylinder Engine 3¾ Inch Bore, 3 Inch Stroke

Dimensions Flange size 1⅛ inch Four Bore—4 bolt type
Primary venturi size 11/32 inch I D
Main venturi (primary) size 15/16 inch
Main venturi (secondary) size 1⅛ inch I D

Vents (2362S) Outside (4) in air horn (4) in flange Inside (7)
(2419S) Outside none Inside (7)

Gasoline Intake Size No 42 (0935 inch) drill hole in needle seat

Low Speed Jet Tube (Primary side only)
Jet size No 65 (035 inch) drill
By Pass in body size No 52 (0635 inch) drill
Economizer in screw plug size (049 inch) diameter
Idle Bleed in body size No 52 (0635 inch) drill

Idle Port (Upper) slot type Primary length 165 inch width 030 inch Secondary none

Idle Port Opening Primary 065 to 071 inch above top edge of valve with valve tightly closed Secondary none

Lower Port Primary (for idle adjustment screw) size No 53 (0595 inch) drill Secondary none

Set Idle Adjustment Screw ¼ to 1¼ turns open For richer mixture turn screw out Do not idle engine below 600 r p m (Power Glide in Drive Range)

Idle Air Adjusting Screw Seat size No 29 (136 inch) drill

Main Nozzle Installed permanently DO NOT REMOVE Anti percolating jet (primary in plug) size No 60 (040 inch) drill (secondary in body) size No 60 (040 inch) drill

Metering Rod (Vacumeter Type) See parts list for size

Metering Rod Jet Primary size 086 inch diameter (for metering rod)
Secondary size 051 inch diameter (no metering rod)

Accelerating Pump Discharge jet (twin) primary side only size No 73 (024 inch) drill
Intake ball check seat size 115 to 120 inch diameter
Discharge needle seat size 070 inch diameter

Discharge relief plug size No 75 (022 inch) drill

Choke (2362S only) Carter Climatic® Control set on index Butterfly type—offset choke valve primary side only Choke heat suction hole restriction in piston housing size No 43 (089 inch) drill

Vacuum Spark Port None

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

Spark Plug Gap 035"	Breaker Point Setting .018"	Ignition Timing Breaker Points to Open 4° B T C or 12° B T.C at 1000 R.P.M.	Valve Setting (Hot) Intake 008" Exhaust 018"	Float Setting Primary ⅛ Inch (Use Gauge T109-232) Secondary ¼ Inch (Use Gauge T109-223)	Idle Adjustment Screw Setting ¼ to 1¼ Idle Engine at 600 R P M. CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical **LATERAL ADJUSTMENT** With oowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge Adjustment should be made by bending arms of floats **VERTICAL ADJUSTMENT.** With float gauge in same position, floats should just clear the horizontal portion of gauge Vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109 232) for primary floats and 1/4 inch (gauge T109 223) for secondary floats Adjust by bending float arms

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, the distance be tween top of floats and bowl cover should be 5/8 inch for primary floats and 3/4 inch for secondary floats Adjust by bending stop tabs on float brackets

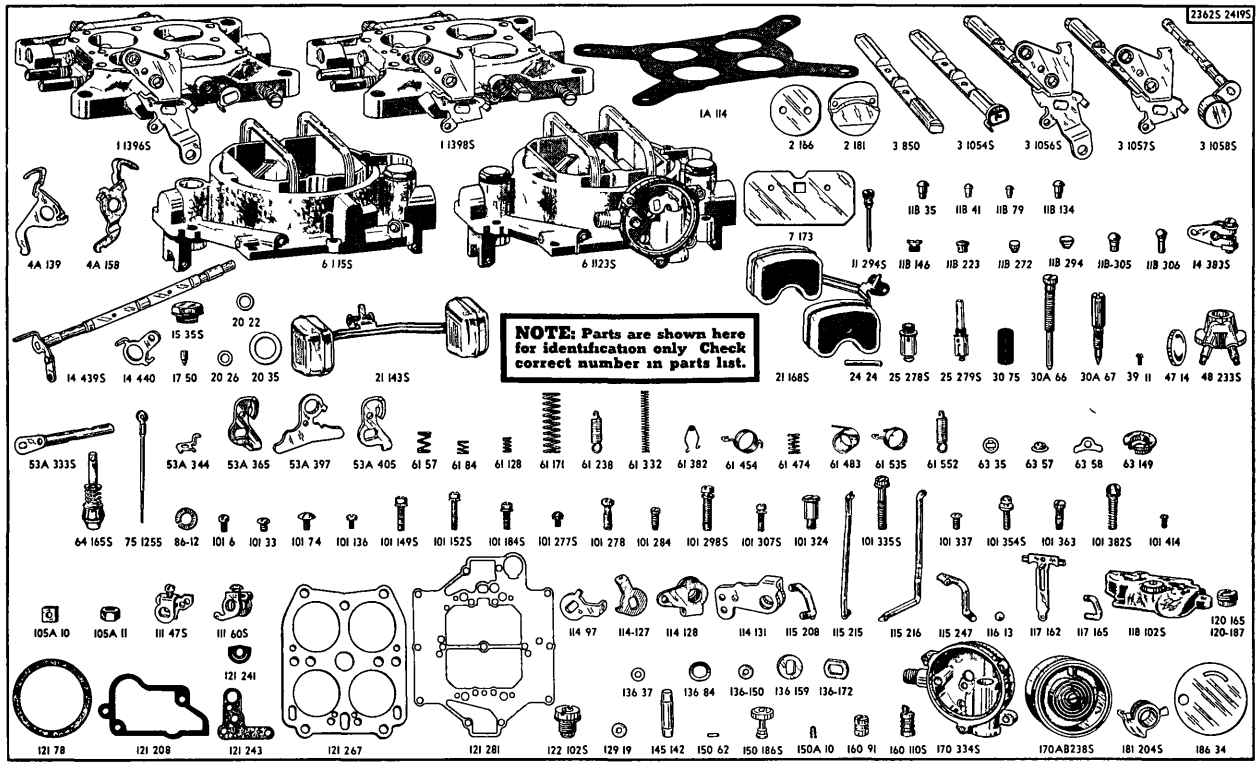
PUMP ADJUSTMENT· Install pump connector link in inner hole (short stroke) of pump arm, with ends extending toward counter shaft arm Back out throttle lever stop screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109 213)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjust ment No metering rod gauges are necessary Procedure s as follows 1 Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacumeter link until metering rods bottom in carbureter body casting 3 Hold ng rods in downward position and throt tle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

FAST IDLE ADJUSTMENT (2362S only) (a) Loosen choke lever clamp screw on choke shaft Insert 020 inch feeler gauge (T109 29) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (b) With choke valve tightly closed bend fast idle adjusting tang until there is 015 inch (gauge T109 44) opening between throttle valve and bore of carbureter side opposite idle port Be sure fast idle adjusting tang is on high step of cam while making this adjustment

UNLOADER ADJUSTMENT: (2362S only) With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109 41)

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments Install dust cover and dust cover gasket Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover To adjust, re move dust cover and bend vapor vent arm



SECONDARY THROTTLE LEVER ADJUSTMENT: Primary and secondary throttle valves should reach wide open position at the same time NOTE Secondary throttle valves will be a few degrees from wide open To adjust, bend throttle operating rod at upper angle (Use bending tool T109-213) With primary and secondary throttle valves in tightly closed position there should be 017 022 inch (gauge T109 29) clearance between positive closing shoes on primary and secondary throttle levers To ad just, bend shoe on primary lever

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: (2362S only) This adjustment should be made after completing fast idle and secondary throttle lever adjustments Crack throttle valves and hold choke valve tightly closed Then close throttle Tang on secondary throttle lever should freely engage in notch of lock out dog If necessary to adjust bend tang on secondary throttle lever

IDLE SPEED AND MIXTURE ADJUSTMENT (NORMAL ENGINE TEMP.): In making the idle adjustment on the engine the air adjustment screw is used to adjust idle speed in a similar man ner as the throttle speed screw used previously Turning the air adjustment screw outward increases engine speed, but also leans the mixture supplied to the manifold which must be com pensated for by adjustment of the idle mixture adjusting screws

FAST IDLE ON CAR (2362S only) 1800 R P M hot engine with idle adjusting tang on high step of cam

WCFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2366S-2366SA**

CARBURETER SPECIFICATIONS

For Chevrolet 8 Cylinder Engine: 3¾ Inch Bore, 3 Inch Stroke

Dimensions: Flange size, 1⅛ inch. Four Bore—4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi (primary) size, 1-1/16 inch.
Main venturi (secondary) size, 15/16 inch I. D.

Vents: Outside, (4) in air horn, (4) in flange. Inside, (5) in air horn.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: (Primary side only).
Jet, size No. 68 (.031 inch) drill.
By-pass, in body, size No. 52 (.0635 inch) drill.
Economizer, in screw plug, size (.049 inch) diameter.
Idle Bleed, in body, size No. 52 (.0635 inch) drill.

Idle Port: (Upper) slot type. Primary, length .175 inch; width .030 inch. Secondary, none.

Idle Port Opening: Primary, .113 to .119 inch above top edge of valve with valve tightly closed. Secondary, none.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill. Secondary, none.

Set Idle Adjustment Screw: ¼ to 1¼ turns open. For richer mixture turn screw out. Do not idle engine below 425 R.P.M. (Automatic Transmission—in Drive Range), 450 R.P.M. (Standard and Overdrive Transmission).

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating bleed (primary, in plug) size No. 60 (.040 inch) drill; (secondary, in body) size No. 60 (.040 inch) drill.

Metering Rod: Primary, economy step .071 inch diameter. Middle step tapers to .065 inch diameter. Power step, .055 inch diameter. Secondary, none.

Metering Rod Jet: Primary, size .091 inch diameter (for metering rod). Secondary, size .054 inch diameter (no metering rod).

Accelerating Pump: Discharge jet (twin) primary side only, size No. 73 (.024 inch) drill.

Intake ball check seat, size .115 to .120 inch diameter.

Discharge needle seat, size .070 inch diameter.

Choke: Carter Climatic® Control, set on index. Butterfly type—offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size (2366S) No. 43 (.089 inch; (2366SA) No. 40 (.098 inch) drill.

Vacuum Spark Port: Horizontal slot (round end) .045 x .110 inch. Top of port .028 to .038 inch above valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .018"	Ignition Timing Breaker Points to Open: 4° B.T.C. at Idle (12° at 1000 R.P.M. With Vacuum Line Disconnected)	Float Setting See Adjustments	Idle Adjustment Screw Setting ¼ t 1¼ Aut . Trans. 425 R.P.M. Std. & O'Drive 450 R.P.M.

NOTE: These cars are equipped with hydraulic valve lifters.—NO ADJUSTMENT.

MARCA REGISTRADA

PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats.

VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109-232) for primary floats and 1/4 inch (gauge T109-223) for secondary floats. Adjust by bending float arms.

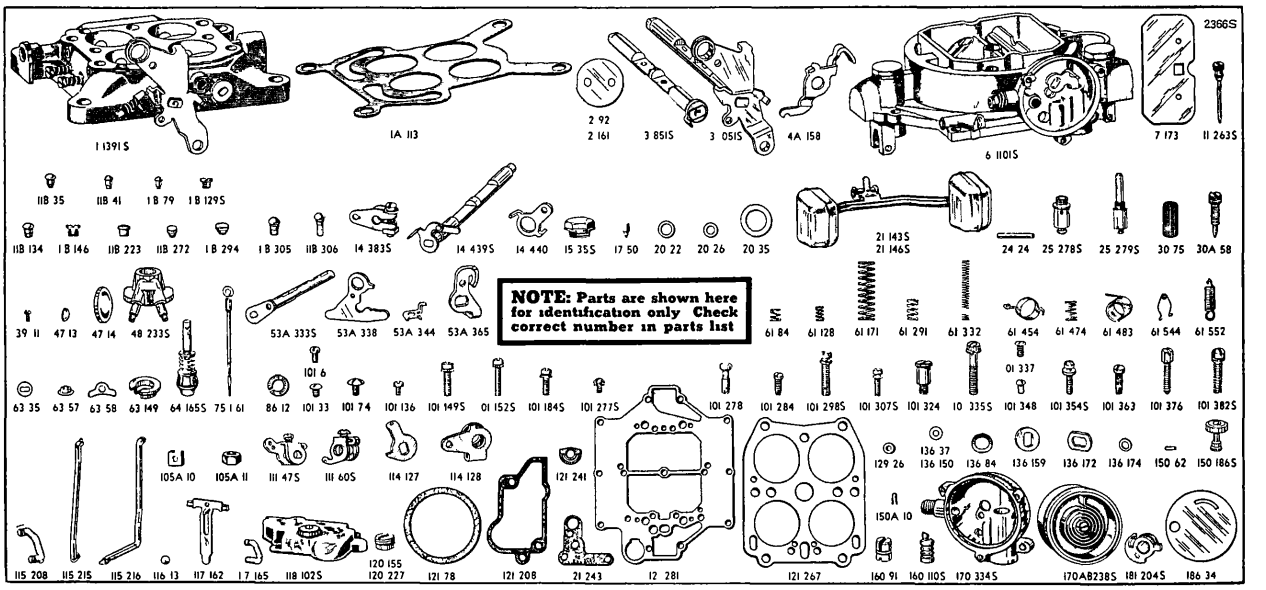
FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be 5/8 inch for primary floats and 3/4 inch for secondary floats. Adjust by bending stop tabs on float brackets.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever stop screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw. (b) With choke valve tightly closed bend fast idle adjusting tang until there is .015 inch (gauge T109-44) opening between throttle valve and bore of carbureter side opposite idle port. Be sure fast idle adjusting tang is on high step of cam while making this adjustment.

FAST IDLE ON CAR: 1800 R.P.M. hot engine with idle adjusting tang on high step of cam.



UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

SECONDARY THROTTLE LEVER ADJUSTMENT: Primary and secondary throttle valves should reach wide open position at the same time. To adjust, bend throttle operating rod at upper angle. (Use bending tool T109-213.) With primary and secondary throttle valves in tightly closed position there should be .017-.022 inch (gauge T109-29) clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on primary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle and secondary throttle lever adjustments. Crack throttle valves and hold choke valve tightly closed. Then close throttle. Tang on secondary throttle lever should freely engage in notch of lockout dog. If necessary to adjust, bend tang on secondary throttle lever.

BULLETIN NO. 46-CHEVROLET
DATE November 5, 1956

SUBJECT: 1955-56 CHEVROLET "V-8"
CARTER WGD-2286S DUAL
REPLACEMENT CARBURETER

Servicemen have asked why the throttle valves on the WGD-2286S dual replacement carbureter do not travel to wide open position.

When this carbureter was in the engineering stage, it was found that the fuel mixture distribution through the intake manifold was improved by stopping the throttle valves a few degrees before wide open position. This improved top speed and performance.

When servicing a WGD-2286S carbureter, it is advisable to check to be certain that the wide open throttle stop (on the throttle lever) has not been bent in an attempt to move the throttle valves to wide open position. The position of the throttle valves can be checked by using a scale, as shown in the illustration. The dimension from the edge of the throttle valve to the bore of the carbureter should be 15/32".

GENERAL BULLETIN

ALL CARBURETER ACCOUNTS

BULLETIN NO. 48 Chevrolet

DATE April 7, 1958

SUBJECT: WGD-2286S DUAL CARBURETER FOR THE CHEVROLET V8

The Carter WGD-2286S carbureter has given an excellent account of itself on thousands of 1955 and 1956 V8 Chevrolets. We are pleased to announce that its application has been extended to cover 1957 and 1958 models. This extended coverage is now possible with the use of an adaptor ring unitized package part number 195-70U.

195-70U Contains:-

1 72-67 adaptor ring (to raise air cleaner to clear the choke housing and ignition coil).

1 121-300 air cleaner gasket

The original air cleaner gasket is placed on the carbureter air horn first, then the adaptor ring. The 121-300 gasket is used between the adaptor ring and the air cleaner. The original stud and wing nut is used to hold the air cleaner in place.

The 1955 and 1956 applications of the WGD-2286S carbureter do not require this unitized package.

An initial shipment is being made to Carter Central distributors of a limited number of the 195-70U units. Carter accounts should anticipate their requirements for part 195-70U and 2286S carbureters and place orders accordingly. There is a ready market for this carbureter.

We have received numerous requests from fleets as well as the motoring public for the 1957 and 1958 applications.

CHEVROLET "V-8"

STANDARD and POWERGLIDE TRANSMISSION

1955-1956

WGD DUAL DOWN-DRAFT CLIMATIC® CONTROL **CARBURETER N . 2286S**

CARBURETER SPECIFICATIONS

For Chevrolet 8 Cylinder Engine: 3¾ Inch Bore, 3 Inch Stroke

Dimensions: Flange size 1¼ inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 21/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Vents: Outside, none. Inside, balance vent in air horn.

Gasoline Intake: Size No. 34 (.111 inch) drill in needle seat.

Low Speed Jet Tube: Jet, size .032 inch diameter. By-pass, in air horn, size No. 53 (.0595 inch) drill. Economizer, in air horn, size No. 55 (.052 inch) drill. Idle Bleed, in air horn, size No. 53 (.0595 inch) drill.

Idle Port: Upper, slot type, length .170 inch; width .030 inch.

Idle Port Opening: .119 to .125 inch above top edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size No. 52 (.0635 inch) drill.

Set Idle Adjustment Screw: 1 to 2 turns open. For richer mixture turn screw out. Do not idle engine below 400 R.P.M. (Powerglide transmission — in Drive Range), 450 R.P.M. (Standard transmission).

Main Nozzle: Nozzle is installed permanently. (DO NOT REMOVE. Anti-percolating well bleed, in plug, size No. 65 (.035 inch) drill. Bleed (between idle well and anti-percolator well) size No. 72 (.025 inch) drill.

Metering Rod (Vacumeter Type): Economy step .067 inch diameter. Middle step tapers to .063 inch diameter. Power step .0565 inch diameter.

Meteirng Rod Jet: Size .091 inch diameter.

Accelerating Pump: Discharge jet (twin) size No. 73 (.024 inch) drill. Intake check seat (in body) size .115 to .120 inch diameter; also intake check ball in plunger shaft. Discharge (needle seat) size No. 50 (.070 inch) drill. Pump jet air bleed passage to outside ⅛ inch drill.

Choke: Carter Climatic® Control—set on index. Butterfly type, offset valve. Choke heat suction hole in air horn size No. 40 (.098 inch) drill.

Vacuum Spark Port: Horizontal slot type .110 by .045 inch. Top of port to be .023 to .033 inch above upper edge of valve with valve tightly closed.

NOTE: Throttle lever is designed so that throttle valves stop a few degrees before wide open position.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open:	Valve Setting (Hot)	Float Setting	Idle Adjustment Screw Setting
.035"	.016"-.019"	4° B.T.D.C.	Standard Trans. Intake .008" Exhaust .016"	¼ Inch (Use Gauge T109-31)	1 to 2 Powerglide 400 R.P.M. Standard Trans. 450 R.P.M.

NOTE: Power Glide Trans. equipped with hydraulic valves—no adjustment necessary.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3659

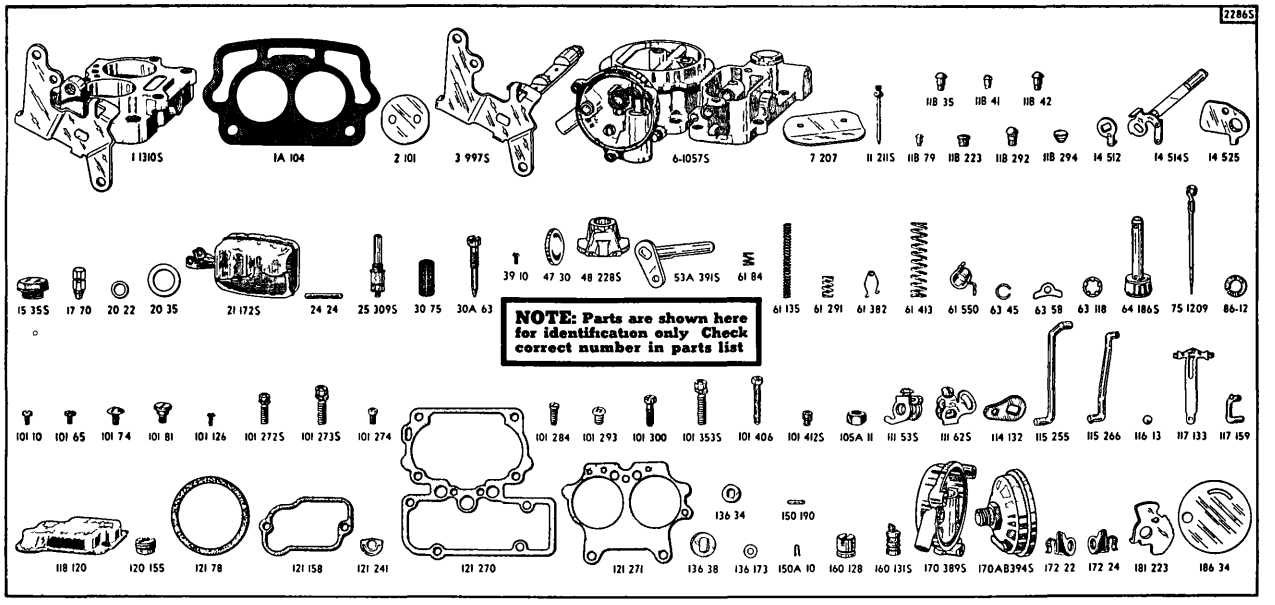
Float Level: ¼" (Gauge T109-31) between top of float (at center) and bowl cover.
To adjust: bend float lever.

Float Alignment: Side of float parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding.
To adjust: bend float lever.

Pump: Flat on pump arm should parallel straight edge on dust cover boss.
To adjust: bend connector rod.

Metering Rod: Metering rod should bottom with throttle valve seated.

Choke Lever Clearance: .005" (Gauge T109-237) between lug on outer choke shaft lever and stop on inner choke shaft lever.
To adjust: bend lug on outer choke shaft lever.



Fast Idle Throttle Valve Clearance: .015" (Gauge T109-44) between lower edge of valve and bore with adjusting tang on high step of cam.

Unloader: 7/32" (Gauge T109-106) between top edge of valve and inner wall of air horn.
To adjust: bend unloader arm on throttle lever

NOTE Figures in parentheses indicate number of pieces used in one carbureter. Where no figure is shown, only one is used.

CARTER MODEL WGD CARBURETER FOR CHEVROLET
(SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor Corporation, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the brass identification tag, when requesting specification pages.

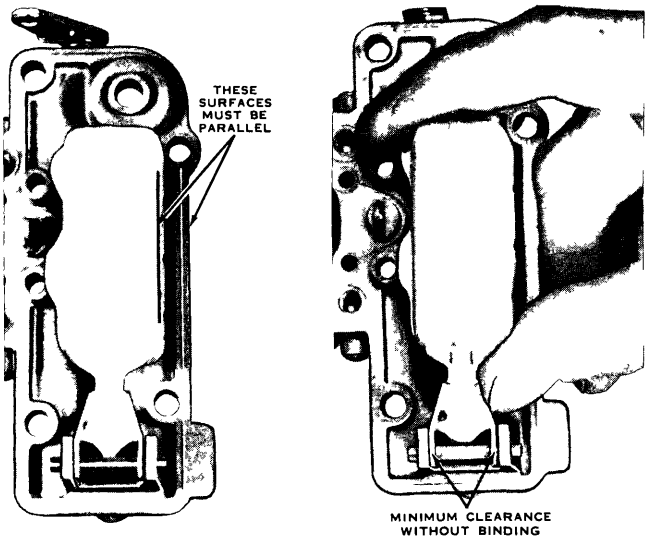

Figure 1

FLOAT ALIGNMENT ADJUSTMENT (Fig. 1)

1. Sight down the side of the float shell to determine if the side of the float is parallel to the outer edge of the air horn casting. TO ADJUST: Bend float lever by applying pressure to the end of the float shell with the fingers while supporting the float lever with the thumb.

   CAUTION: To avoid damaging the float, apply only enough pressure to bend float lever.

2. After aligning float, remove as much clearance as possible between arms of float lever and lugs on air horn by bending the float lever. Arms of float lever should be as parallel to the inner surfaces of lugs on air horn as possible.

   Float must operate freely without excess clearance on its hinge pin.

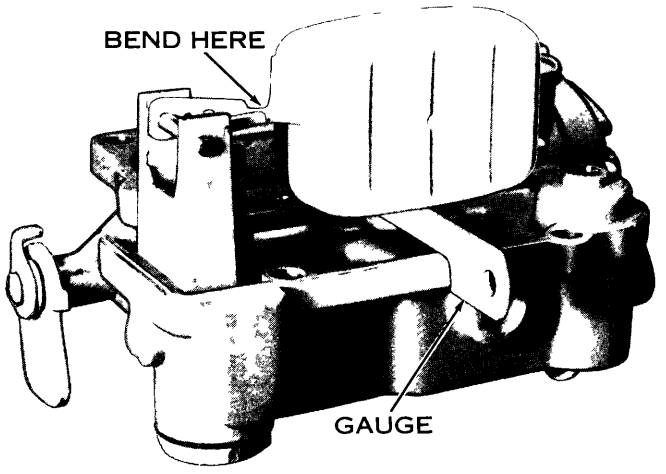

Figure 2

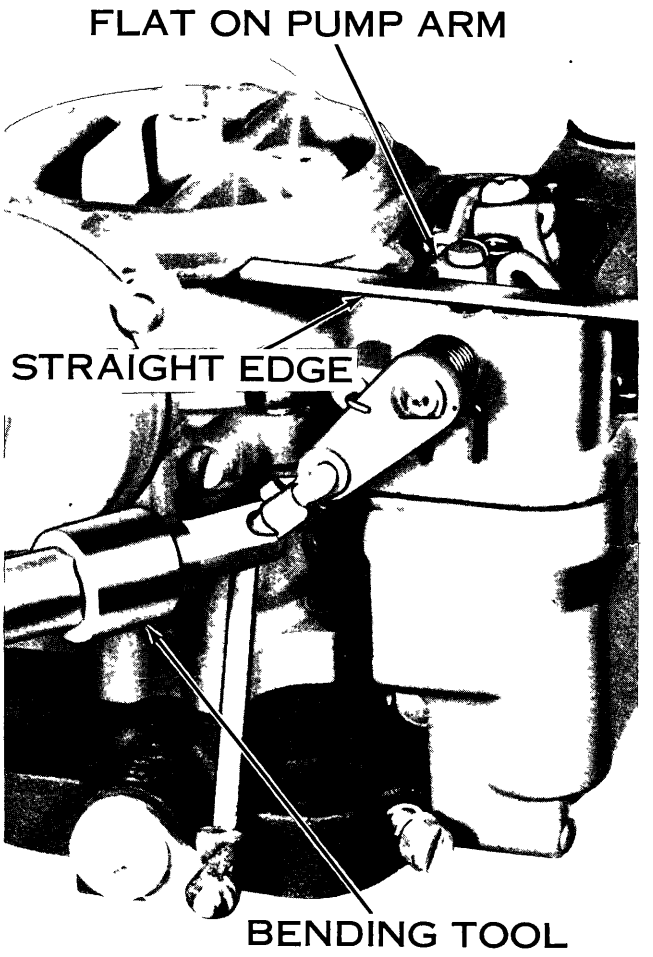

Figure 3

PUMP ADJUSTMENT (Fig. 3)

1. Back out idle speed screw until throttle valves seat in bores of carbureter. **NOTE:** Be sure choke is wide open so fast idle cam does not hold valve open.
2. Hold straight edge across top of dust cover boss at pump arm. Bend rod at upper angle until flat of pump arm is parallel with straight edg while throttle valves are seated. (Use bending tool T109-213.)

FLOAT LEVEL ADJUSTMENT (Fig. 2)

With air horn inverted and needle seated, adjust float arm so clearance between top center of float and air horn is as listed on carbureter specification page. Recheck float alignment.

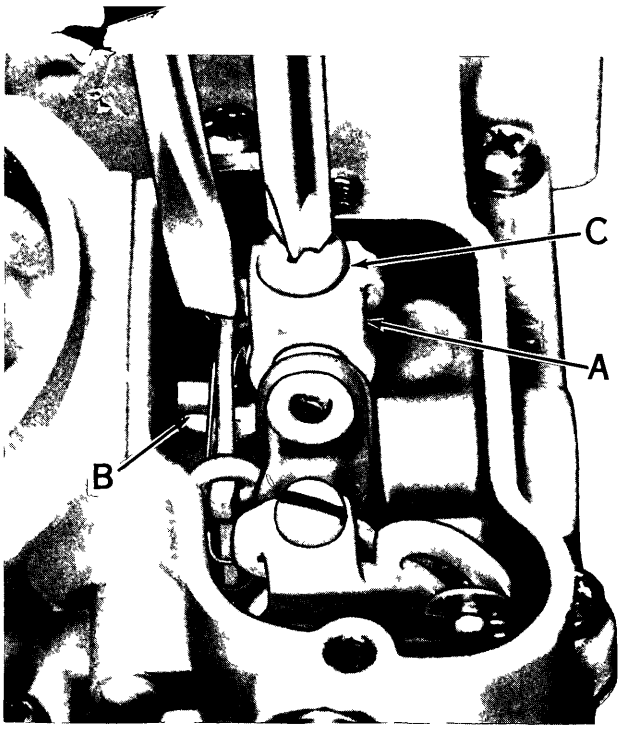

Figure 4

METERING ROD ADJUSTMENT (Fig. 4)

1. Back out idle speed screw until throttle valves seat. **NOTE:** Be sure choke is wide open so fast idle cam does not hold valve open.
2. Press down on vacumeter piston link until metering rods bottom in carbureter body.
3. Holding rods in this downward position and with throttle valves seated, revolve metering rod arm (A) until finger (B) on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw (C).

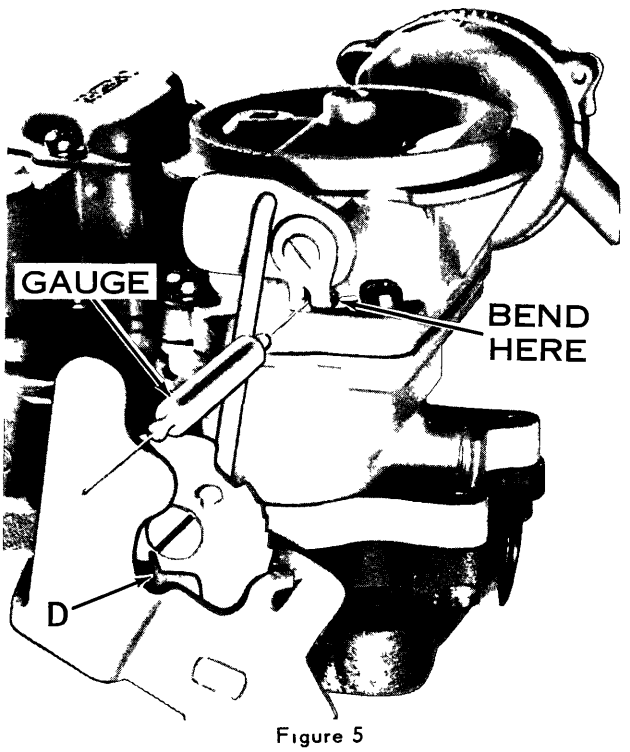

Figure 5

CHOKE SHAFT LEVER CLEARANCE ADJUSTMENT (Fig. 5)

1. H ld choke valve tightly closed.
2. Hold fast idle cam against stop on casting (D).
3. The clearance between lug on outer choke shaft lever and stop on inner choke shaft lever should be as list d on carbureter specification page. TO ADJUST: Bend lug on outer choke shaft lever. (Use bending tool T109-214.)

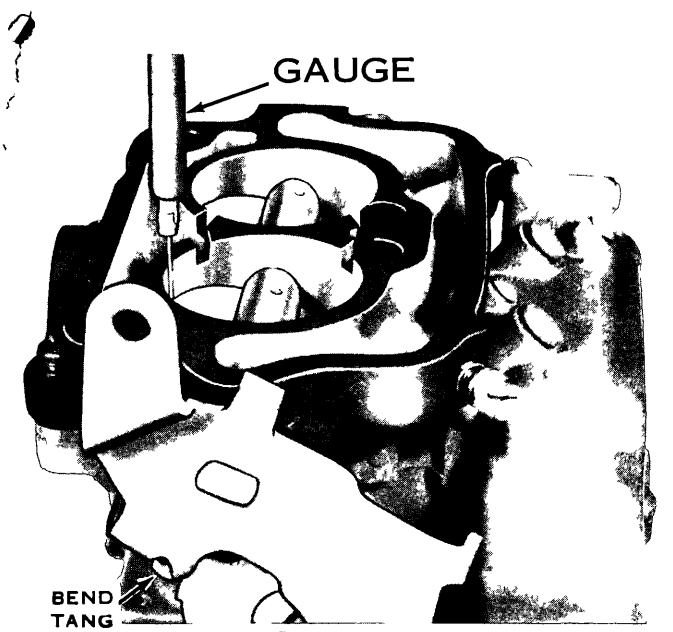

Figure 6

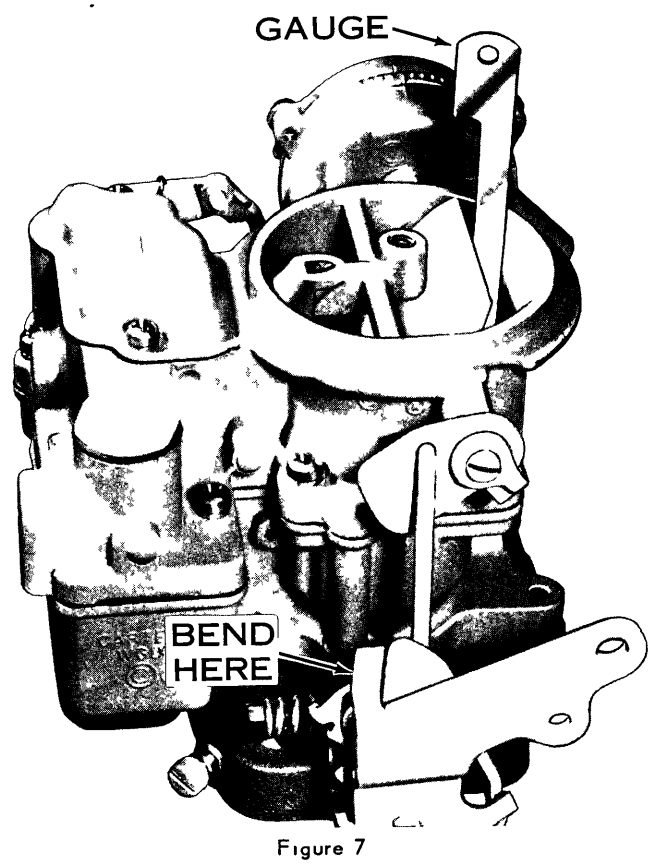
FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 6)

1. Be sure choke valve is closed.
2. Bend fast idle adjusting tang against high step of cam until the clearance between throttle valve (side opposite port) and bore is as listed on carbureter specification page.



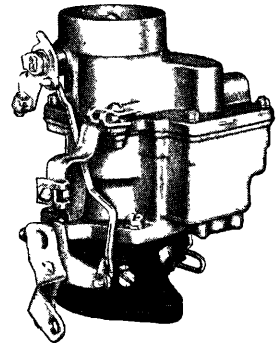


Figure 7

UNLOADER ADJUSTMENT (Fig. 7)

1. Hold throttle valves wide open.
2. Close choke valve as far as possibl without forcing.
3. Clearance between top edge of choke valve and inner wall of air horn should be as listed on carbureter specification page.
4. Adjust by bending choke unloader arm n throttle lever. (Use bending tool T109-41.)

This carbureter can also be used on 1953-1956 passenger cars by addition of a hand choke wire assembly, Carter bracket parts; (1) No. 180-71, (2) No. 101-12, (2) No. 86-10, (2) No. 105A-10 and (1) No. 156-17 fitting

Casting No 1127 on face of flange.

YF DOWN-DRAFT **CARBURETER No. 2100S**

CARBURETER SPECIFICATIONS

For Chevrolet 6 Cylinder Engine 3 9/16 Inch Bore, 3 15/16 Inch Stroke

Dimensions Flange size 1½ inch S A E
Primary venturi, 11/32 inch I D
Secondary venturi, 11/16 inch I D
Main venturi, 1-5/16 inch I. D

Float Setting: See adjustments

Vents Outside No 12 (.189 inch) drill
Inside balance vent size, No 42 (.0935 inch) drill in air horn

Gasoline Intake. Spring loaded needle Size No 46 (.081 inch) drill in needle seat

Low Speed Jet Tube Jet size No 70 (.028 inch) drill By pass in body, size No 51 (.067 inch) drill Economizer size No 54 (.055 inch) drill

Idle Port: Upper port, slot type, length .190 inch width .040 inch.

Idle Port Opening. Top of port .143 to .147 inch above top edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw). .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open For richer mixture turn screw out Idle engine 475 r p m

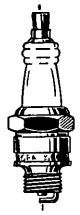
Main Nozzle. Nozzle is installed permanently DO NOT REMOVE Drilled passage from anti percolator passage to bore size No 59 (.041 inch) drill

Metering Rod Economy step .067 inch, middle step tapers to .060 inch power step .050 inch diameter

Metering Rod Jet Size .0945 inch diameter

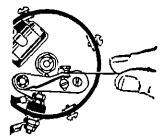
Metering Rod Setting: See adjustments

Accelerating Pump. Diaphragm type vacuum and mechanically operated Pump jet size No 74 (.0225 inch) drill Intake ball check seat (in diaphragm housing) size No 40 (.098 inch) drill Discharge needle seat (in body) size No 42 (.0935 inch) drill Vacuum restriction (in flange) size No 55 (.052 inch) drill Vacuum passage (diaphragm bleed) size No 56 (.0465 inch) drill Pump bleed into bowl size No 75 (.021 inch) drill



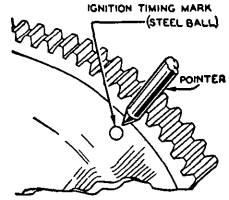
Pump Adjustment: See adjustments

Choke: Manual, interconnected with throttle Valve offset butterfly type.



Vacuum Spark Port Horizontal slot type, size .125 by .041 inch Top of port (early prod.) .030 to .040 inch; (late prod.) .035 to .045 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!



CAUTION. Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

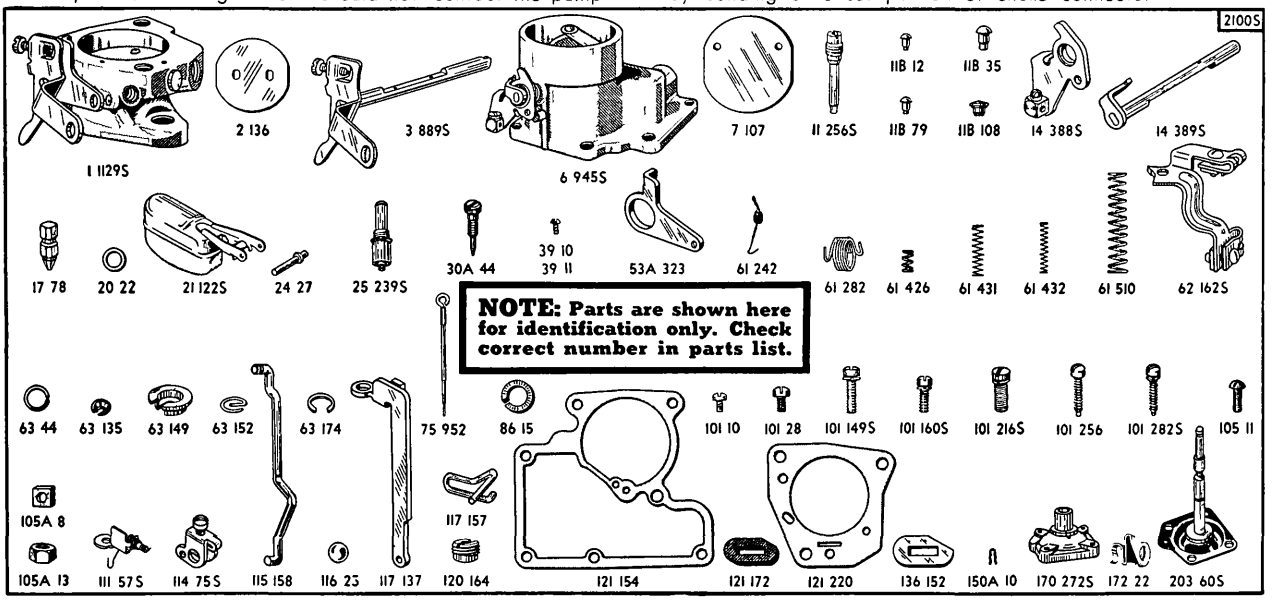
CARBURETER ADJUSTMENTS

Float Adjustment With bowl cover assembly inverted and float resting on pin in seated needle and with gasket removed the distance from the bowl cover to the top of float should be 9/32 inch (Gauge T109 126) Do not depress float lip against spring loaded pin in needle but let float rest of its own weight Adjust by bending lip of float not float arm Float setting must be checked with the bowl cover held at eye height in a level position



Float Drop With bowl cover assembly held in upright position the distance between free end of float and bowl cover should be 1¼ inches Adjust by bending stop tabs on float arm

Pump Adjustment This adjustment should be made before the metering rod adjustment and should be checked each time the carbureter is reassembled With throttle valve seated in the bore of carbureter press down on upper end of diaphragm shaft until it reaches its bottom position (tool T109 212 may be used to hold diaphragm shaft down while checking pump adjustment) The metering rod arm should now contact the pump lifter link at the outer end nearest the springs Adjust by bending pump connector link at its lower angle Use bending tool T109-213

Caution Bend connector rod only at its lower angle as any other method may cause pump lifter link to bind

Metering Rod Adjustment This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed With throttle valve seated in bore of carbureter press down on upper end of diaphragm shaft until diaphragm bottoms in vacuum chamber Tool T109 212 may be used to hold diaphragm shaft down while adjusting metering rod Metering rod should contact bottom of metering rod well and metering rod arm should contact lifter link at the outer end nearest the springs and at supporting lug Adjust by bending lip of metering rod arm to which metering rod is attached up or down

Fast Idle Adjustment With choke held in wide open position lip of fast idle arm should contact boss on body casting Adjust by bending at offset portion of choke connector link

YF DOWN-DRAFT CLIMATIC® CONTROL **CARBURETER No. 2101S**

CARBURETER SPECIFICATIONS

Chevrolet 6 Cylinder Engine: 3-9/16 Inch Bore, 3-15/16 Inch Stroke

Dimensions: Flange size 1½ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1-5/16 inch I. D.

Float Setting: See adjustments.

Vents: Outside, No. 12 (.189 inch) drill.
Inside balance vent size, No. 42 (.0935 inch) drill in air horn.

Gasoline Intake: Spring loaded needle. Size No. 46 (.081 inch) drill in needle seat.

Low Speed Jet Tube: Jet, size No. 70 (.028 inch) drill. By-pass in body, size .069 inch diameter. Economizer, size No. 53 (.0595 inch) drill.

Idle Port: Upper port, slot type, length .190 inch, width .040 inch.

Idle Port Opening: Top of port .143 to .147 inch above top edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: 1 to 2 turns open. For richer mixture turn screw out. Do not idle engine below 425 r.p.m. (Power Glide Transmission—in Drive Range); 475 r.p.m. (Syncromesh Transmission).

Main Nozzle: Nozzle is installed permanently. DO NOT REMOVE. Drilled passage from anti-percolator passage to bore, size No. 59 (.041 inch) drill.

Metering Rod: Economy step .067 inch diameter; middle step tapers to .060 inch diameter; power step .050 inch diameter.

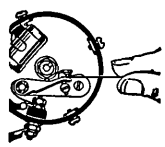
Metering Rod Jet: Size .0945 inch diameter.

Metering Rod Setting: See adjustments.

Accelerating Pump: Diaphragm type, vacuum and mechanically operated. Pump jet, size No. 74 (.0225 inch) drill. Intake ball check seat (in diaphragm housing), size No. 40 (.098 inch) drill. Discharge needle seat (in body), size No. 42 (.0935 inch) drill. Vacuum restriction (in flange), size No. 55 (.052 inch) drill. Vacuum passage (diaphragm bleed), size No. 56 (.0465 inch) drill. Pump bleed into bowl, size No. 75 (.021 inch) drill.

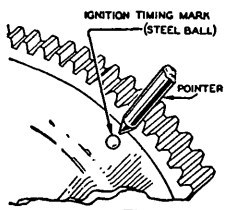
Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control, set one point rich. Offset, butterfly type. Choke heat suction hole in body, size No. 36 (.1065 inch) drill.



Vacuum Spark Port: Horizontal slot type, size .125 by .040 inch. Top of port (Early Prod.) .030 to .040 inch; (Late Prod.) .035 to .045 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: With bowl cover assembly inverted and float resting on pin in seated needle, and with gasket removed, the distance from the bowl cover to the top of float should be 9/32 inch (Gauge T109-126). Do not repress float lip against spring loaded pin in needle, but let float rest of its own weight. Adjust by bending lip of float, not float arm. Float setting must be checked with the bowl cover held at eye height in a level position.

FLOAT DROP: With bowl cover assembly held in upright position the distance between free end of float and bowl cover should be 1¼ inches. Adjust by bending stop tabs on float arm.

PUMP ADJUSTMENT: This adjustment should be made before the metering rod adjustment and should be checked each time the carbureter is reassembled. With throttle valve seated in the bore of carbureter, press down on upper end

of diaphragm shaft until it reaches its bottom position (tool T109-212 may be used to hold diaphragm shaft down while checking pump adjustment) The metering rod arm should now contact the pump lifter link at the outer end nearest the springs Adjust by bending pump connector link at its lower angle Use bending tool T109-213

CAUTION Bend connector rod only at its lower angle, as any other method may cause pump lifter link to bind

METERING ROD ADJUSTMENT This adjustment is important and should be checked each time the carbureter is reassembled or lean rods installed With throttle valve seated in bore of carbureter press down on upper end of diaphragm shaft until diaphragm bottoms in vacuum chamber Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod Metering rod should contact bottom of metering rod well and metering rod arm should contact lifter link between springs and at supporting lug Adjust by bending lip of metering rod arm to which metering rod is attached, up or down

FAST IDLE ADJUSTMENT: Remove thermostatic coil housing gasket and baffle plate Crack throttle valve, and hold choke valve fully closed then close throttle This will allow fast idle cam to revolve to fast idle position With choke valve held tightly closed and slight tension on throttle lever, there should now be 040 inch clearance (Gauge T109 193) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending connector link at lower angle Use bending tool T109-213

UNLOADER ADJUSTMENT This adjustment must be made after fast idle adjustment Hold throttle valve in wide open position and close choke valve as far as possible without forcing There should be ¼ inch clearance (Gauge T109-31) between lower edge of choke valve and inner wall of air horn Adjust by bending arm of choke trip lever (Use tool T109-214)

NOTE Power Glide Trans equipped with hydraulic valves—no adjustment necessary.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vertical **LATERAL ADJUSTMENT** With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge Adjustment should be made by bending arms of floats
VERTICAL ADJUSTMENT With float gauge in same position, floats should just clear the horizontal portion of gauge Vertical distance between top of float and machined surface of casting must be ⅛ inch (gauge T109-232) for primary floats and ¼ inch (gauge T109 223) for secondary floats Adjust by bending float arms

FLOAT DROP ADJUSTMENT With bowl cover held in upright position and measuring from center of float the distance between top of floats and bowl cover should be ⅝ inch for primary floats and ¾ inch for secondary floats Adjust by bending stop tabs on float brackets

PUMP ADJUSTMENT Install pump connector link in outer hole (long stroke) of pump arm with ends extending toward countershaft arm Back out throttle lever stop screw until throttle valves seat in bores of carbureter Hold straight

CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

S S PRINTED IN U S A

edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw. (b) With choke valve tightly closed tighten fast idle adjusting tang until there is .015 inch (gauge T109-44) opening between throttle valve and bore of carbureter side opposite idle port. Be sure fast idle adjusting tang is on high step of cam while making this adjustment.

UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

SECONDARY THROTTLE LEVER ADJUSTMENT: Primary and secondary throttle valves should reach wide open position at the same time. To adjust, bend throttle operating rod at upper angle. (Use bending tool T109-213.) With primary and secondary throttle valves in tightly closed position there should be .017-.022 inch (gauge T109-29) clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on primary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle and secondary throttle lever adjustments. Crack throttle valves and hold choke valve tightly closed. Then close throttle. Tang on secondary throttle lever should freely engage in notch of lock-out dog. If necessary to adjust, bend tang on secondary throttle lever.

WCFB Four-Bore Down-Draft Climatic® Control **Carbs. Nos. 2816S-2817S**

CARBURETER SPECIFICATIONS

For Chevrolet 8 Cylinder 348 Cu. In. Engine: Vacuum at Idle 18 Inches

Dimensions: Flange size, 1¼ inch Four Bore—4 bolt type
Primary venturi size 11/32 inch I D
Main venturi (primary) size 1-1/16 inch
Main venturi (secondary) size 1¼ inch I D

Vents· Outside none Inside (4 drilled holes, 1 tube) in air horn

Low Speed Circuit: (Primary side only)
Jet, size No 68 (.031 inch) drill By pass in body size No 52 (.0635 inch) drill Economizer plug in body size No 55 (.052 inch) drill Idle bleed, in body, size No 52 (.0635 inch) drill Idle port (upper) slot type length .175 inch width .030 inch

Idle Port Opening: .113 to .119 inch above top edge of valve with valve tightly closed

Lower Port: (For idle adjustment screw) size No 53 (.0595 inch) drill

Set Idle Adjustment Screw: ½ to 2 turns open For richer mixture turn screw out Do not idle engine below 475 R P M for Std & O D Trans 450 R P M for Power Glide and Turbo Glide in drive range

Main Nozzle: Installed permanentlly DO NOT REMOVE Anti-percolating bleed (primary, in plug) size No 60 (.040 inch) drill (secondary in body) size No 66 (.033 inch) drill

Accelerating Pump: Discharge jet (twin) primary side only size No 73 (.024 inch) drill
Intake ball check seat size .115 to .120 inch diameter
Discharge needle seat size .070 inch diameter

Choke· Carter Climatic® Control set on index Butterfly type —offset choke valve primary side only Choke heat suction hole restriction in piston housing size No 40 (.098 inch) drill

Vacuum Spark Port· NONE—Spark passage open to manifold vacuum

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .018"	Ignition Timing Breaker Points to Open: 4° B. T. C. (With Distributor Vacuum Line Disconnected)	Float Setting Primary 5/32 Inch (Use Gauge T109-236) Secondary 9/32 Inch (Use Gauge T109-284)	Idle Adjustment Screw Setting ½ to 2 Auto. Trans. 450 R.P.M. Std. & O'Drive 475 R.P.M.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENTS: Two separate float adjustments must be made—lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. **VERTICAL ADJUSTMENT:** With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 5/32 inch (gauge T109-236) for primary floats and 9/32 inch (gauge T109-284) for secondary floats. Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position, bowl cover gasket removed and measuring from free end of floats, the distance between the bottom of the floats and bowl cover should be 2 inches, plus or minus 1/16 inch, for both primary and secondary floats. Adjust by bending stop tabs on float brackets.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever stop screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

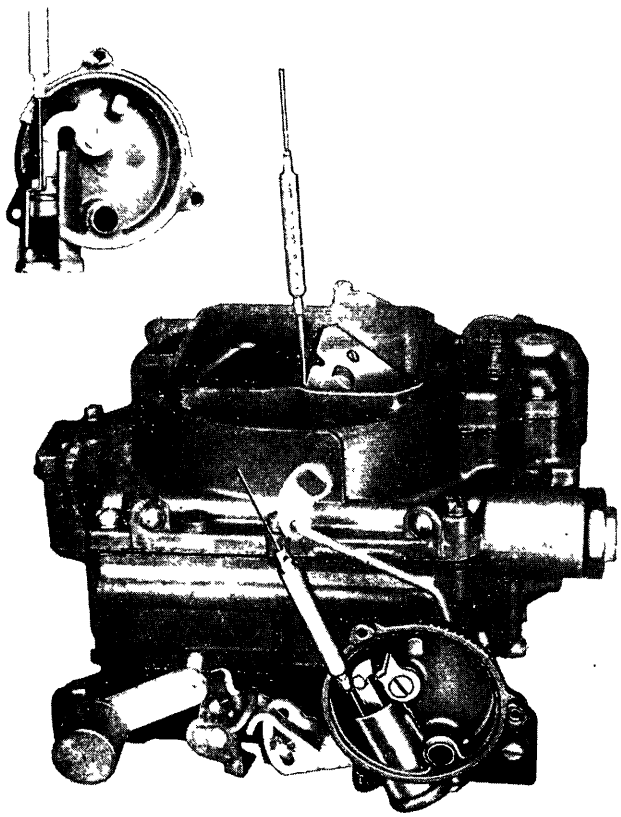

Fig. 1

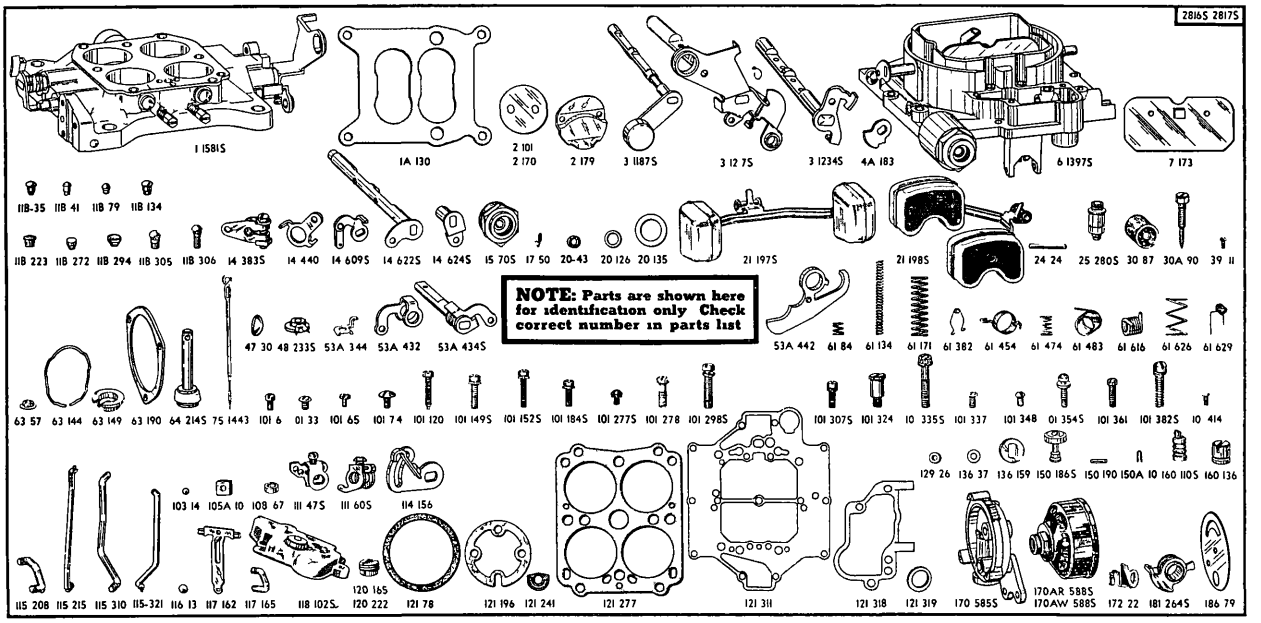
CHOKE PISTON LEVER ADJUSTMENT: 1. Bend a .026" wire gauge (tool T109-189) at a 90° angle approximately 1/8" from its end (See Insert Fig. 1). 2. Remove the choke housing, gasket and baffle plate and block the throttle about half open so the fast idle cam does not contact its adjusting screw. 3. Open the choke valve and insert the wire gauge so that the bent portion is between the top of the slot in the choke piston cylinder and the bottom of the slot in the piston (See Insert Fig. 1). Hold the wire gauge in position and close the choke valve by pressing on the piston lever in the choke housing until resistance is felt. There should now be .080" (gauge T109-234) between the top of the choke valve and the air horn (See Fig. 1). 4. To adjust, bend choke connector rod.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020 inch wire gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw. (b) No adjustment is necessary for fast idle throttle valve clearance. This is determined by the normal idle position of the speed screw.



FAST IDLE ON CAR: 1600 to 1800 R.P.M. hot engine with idle speed screw on high step of cam. No adjustment necessary.

UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustment. Install dust cover gasket and dust cover tightly assembled against tabs on gasket. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbuerter. There should be 3/32 inch (gauge T109-125) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. Back out throttle lever stop screw so that primary valves seat in bores of carbureter. 3. With primary valves open 7/32" (gauge T109-106) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: Secondary valves will be a few degrees from wide open, when primary valves are wide open. With primary and secondary valves tightly closed there should be .010" to .030" (gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary throttle lever.

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close choke valve. Tang on lock-out arm should freely engage in notch of auxiliary throttle shaft dog. To adjust, bend tang on lock-out arm.

CARBURETER SPECIFICATIONS

For Chevrolet 8 Cylinder 283 Cu. In. Engine· Vacuum at Idle 11.0 Inches with race cam

Dimensions: Flange size 1 1/8 inch Four Bore—4 bolt type
Primary venturi size, 11/32 inch I D
Main venturi (primary) size 15/16 inch
Main venturi (secondary) size 1 1/8 inch I D

Vents: (2614S) Outside, (4) in air horn (4) in flange Inside (7)
(2613S) Outside none Inside (7)

Low Speed Circuit: Primary side only
Jet size No 65 (.035 inch) drill
By pass in body, size No 53 (.0595 inch) drill
Economizer, in screw plug size No 56 (.0465 inch) drill.
Idle bleed, in body, size No 52 (.0635 inch) drill
Idle port, slot type, length .174 inch, width .030 inch

Idle Port Opening: Primary, .113 to .119 inch above top edge of valve with valve tightly closed

Lower Port: Primary (for idle adjustment screw) size No 53 (.0595 inch) drill

Set Idle Adjustment Screw: 1/8 to 1 1/4 turns open For richer mixture turn screw out Do not idle engine below 800 R P M

Main Nozzle: Installed permanently DO NOT REMOVE Anti percolating jet (primary in plug) size No 60 (.040 inch) drill (secondary in body) size No 60 (.040 inch) drill

Accelerating Pump: Discharge jet (twin) primary side only size No 73 (.024 inch) drill

Intake ball check seat size .115 to .120 inch diameter

Discharge needle seat size .070 inch diameter

Choke: (2614S only) Carter Climatic® Control set on index Butterfly type—offset choke valve primary side only Choke heat suction hole restriction in piston housing size No 43 (.089 inch) drill

Vacuum Spark Port: None

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .018"	Ignition Timing Breaker Points to Open: 14° B.T.C. at Idle or 18° B.T.C. at 1000 R.P.M. CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made — lateral and vertical **LATERAL ADJUSTMENT.** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge Adjustment should be made by bending arms of floats **VERTICAL ADJUSTMENT:** With float gauge in same position, floats should just clear the horizontal portion of gauge Vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109-232) for primary floats and 1/4 inch (gauge T109 223) for secondary floats Adjust by bending float arms

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be 5/8 inch for primary floats and 3/4 inch for secondary floats Adjust by bending stop tabs on float brackets

PUMP ADJUSTMENT: Install pump connector link in inner hole (short stroke) of pump arm with ends extending toward countershaft arm Back out throttle lever stop screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109 213)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows 1 Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

FAST IDLE ADJUSTMENT: (2614S only) (a) Loosen choke lever clamp screw on choke shaft Insert 020 inch feeler gauge (T109 29) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (b) With choke valve tightly closed bend fast idle adjusting tang until there is 018 inch (gauge T109 44) opening between throttle valve and bore of carbureter side opposite idle port Be sure fast idle adjusting tang is on high step of cam while making this adjustment

FAST IDLE ON CAR: (2614S only) 1800 R P M hot engine with idle adjusting tang on high step of cam

UNLOADER ADJUSTMENT: (2614S only) With throttle wide open there should be 3/16 inch (gauge T109 28) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41)

BOWL VAPOR VENT ADJUSTMENT· This adjustment should be made after completing pump and metering rod adjustments Install dust cover and dust cover gasket Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter There should be 1/16 inch (gauge T109 197) between lower edge of bowl vapor vent valve and dust cover To adjust remove dust cover and bend vapor vent arm

SECONDARY THROTTLE LEVER ADJUSTMENT: Primary and secondary throttle valves should reach wide open position at the same time NOTE Secondary throttle valves will be a few degrees from wide open To adjust bend throttle operating rod at upper angle (Use bending tool T109-213) With primary and secondary throttle valves in tightly closed position there should be 017 022 inch (gauge T109-29) clearance between positive closing shoes on primary and secondary throttle levers To adjust bend shoe on secondary lever

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: (2614S only) This adjustment should be made after completing fast idle and secondary throttle lever adjustments Crack throttle valves and hold choke valve tightly closed Then close throttle Tang on secondary throttle lever should freely engage in notch of lock out dog If necessary to adjust, bend tang on secondary throttle lever

WCFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2669S**

CARBURETER SPECIFICATIONS

For Chevrolet 8 Cylinder 283 Cu. In. Engine: Vacuum at Idle 18 Inches

Dimensions: Flange size 1-1/8 inch Four Bore—4 bolt type
Primary venturi size, 11/32 inch I D
Main venturi (primary) size 1 inch
Main venturi (secondary) size 1 1/8 inch I D

Vents: Outside none Inside (4 drilled holes 1 tube) in air horn

Low Speed Circuit: (Primary side only)
Jet size No 68 (031 inch) drill By pass in body, size No 52 (0635 inch) drill Economizer, plug in body size No 55 (052 inch) drill Idle bleed in body size No 52 (0635 inch) drill Idle port (upper) slot type length 175 inch width 030 inch

Idle Port Opening: 113 to 119 inch above top edge of valve with valve tightly closed

Lower Port: (For idle adjustment screw), size No 53 (0595 inch) drill

Set Idle Adjustment Screw: 1/4 to 1 3/4 turns open For richer mixture turn screw out Do not idle engine below 450 R P M for Std & O D Trans in neutral, 425 R P M for Power Glide 450 R P M for Turbo Glide in drive range

Main Nozzle: Installed permanently DO NOT REMOVE Anti percolating bleed (primary in plug) size No 60 (040 inch) drill (secondary in body) size No 66 (033 inch) drill

Accelerating Pump: Discharge jet (twin) primary side only size No 73 (024 inch) drill
Intake ball check seat size 115 to 120 inch diameter
Discharge needle seat size 070 inch diameter

Choke: Carter Climatic® Control set on index Butterfly type—offset choke valve primary side only Choke heat suction hole restriction in piston housing size No 40 (098 inch) drill

Vacuum Spark Port: Horizontal slot (round end) 045 x 110 inch
Top of port 028 to 038 inch above valve with valve tightly closed

Motor Tune-Up — Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .018"	Ignition Timing Breaker Points to Open: 4° B. T. C. At Vibration Damper	Float Setting Primary 1/8 Inch (Use Gauge T109-232) Secondary 1/4 Inch (Use Gauge T109-223)	Idle Adjustment Screw Setting See Specifications

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. **VERTICAL ADUSTMENT:** With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109-232) for primary floats and 1/4 inch (gauge T109-223) for secondary floats. Adjust by bending float arms.

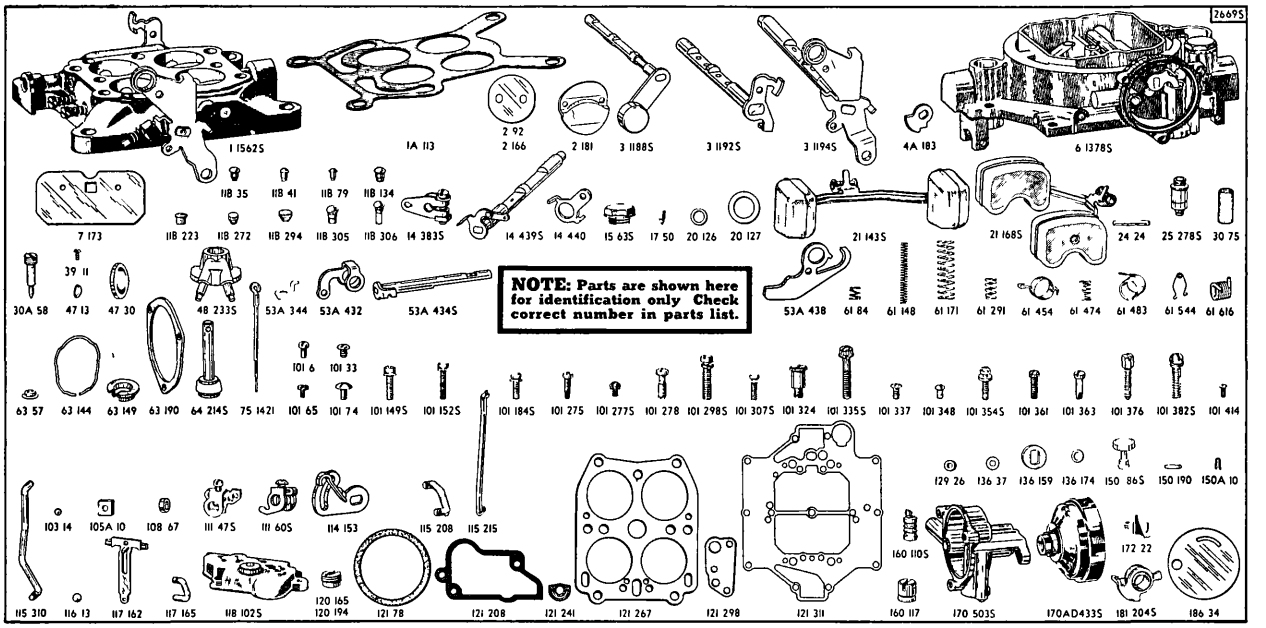
FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be 5/8 inch for primary floats and 3/4 inch for secondary floats. Adjust by bending stop tabs on float brackets.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever stop screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw. (b) With choke valve tightly closed bend fast idle adjusting tang until there is .012 inch (gauge T109-200) opening between throttle valve and bore of carbureter side oposite idle port. Be sure fast idle adjusting tang is on high step of cam while making this adjustment.

FAST IDLE ON CAR: 1600 R. P. M. hot engine with idle adjusting tang on high step of cam.



UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter. There should be 3/32 inch (gauge T109-125) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. Back out throttle lever stop screw so that primary valves seat in bores of carbureter. 3. With primary valves open 11/64" (gauge T109-166) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: Secondary valves will be a few degrees from wide open, when primary valves are wide open. With primary and secondary valves tightly closed there should be .010" to .030" (gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary throttle lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close choke valves. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.

WCFB Four-Bore Down-Draft Climatic® Control Carbs. Nos. 2656S-2657S

CARBURETER SPECIFICATIONS

For Chevrolet 8 Cylinder 348 Cu. In. Engine: Vacuum at Idle 18 Inches

Dimensions: Flange size, 1¼ inch Four Bore—4 bolt type
Primary venturi size 11/32 inch I D
Main venturi (primary) size 1-1/16 inch
Main venturi (secondary) size 1¼ inch I D

Vents: Outside none Inside (4 drilled holes 1 tube) in air horn

Low Speed Circuit: (Primary side only)
Jet size No 68 (031 inch) drill By pass in body, size No 52 (0635 inch) drill Economizer plug in body size No 55 (052 inch) drill Idle bleed in body size No 52 (0635 inch) drill. Idle port (upper) slot type length 175 inch width 030 inch

Idle Port Opening: 113 to 119 inch above top edge of valve with valve tightly closed

Lower Port (For idle adjustment screw), size No 53 (0595 inch) drill

Set Idle Adjustment Screw: ¼ to 1¾ turns open For richer mixture turn screw out Do not idle engine below 450 R P M for Std & O D Trans in neutral 425 R P M for Power Glide, 450 R P M for Turbo Glide in drive range

Main Nozzle: Installed permanently DO NOT REMOVE Anti-percolating bleed (primary in plug) size No 60 (040 inch) drill (secondary in body) size No 66 (033 inch) drill

Accelerating Pump: Discharge jet (twin) primary side only siz No 73 (024 inch) drill
Intake ball seat size 115 to 120 inch diameter
Discharge needle seat size 070 inch diameter

Choke: Carter Climatic® Control set on index. Butterfly type—offset choke primary side only Choke heat suction hole restriction in piston housing, size No 40 (098 inch) drill

Vacuum Spark Port: Horizontal slot (round end) 045 x 110 inch Top of port 038 to 048 inch above valve with valve tightly closed.

Motor Tune-Up — Be Accurate!

CAUTION· Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .018"	Ignition Timing Breaker Points to Open: 4° B. T. C	Float Setting Primary ⅛ Inch (Use Gauge T109-232) Secondary ¼ Inch (Use Gauge T109-223)	Idle Adjustment Screw Setting ¼ to 1¾ Turns Open (See Adjustments)

NOTE: These cars are equipped with Hydraulic Valve Lifters — NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENTS: Two separate float adjustments must be made—lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. **VERTICAL ADJUSTMENT:** With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109-232) for primary floats and 1/4 inch (gauge T109-223) for secondary floats. Adjust by bending float arms.

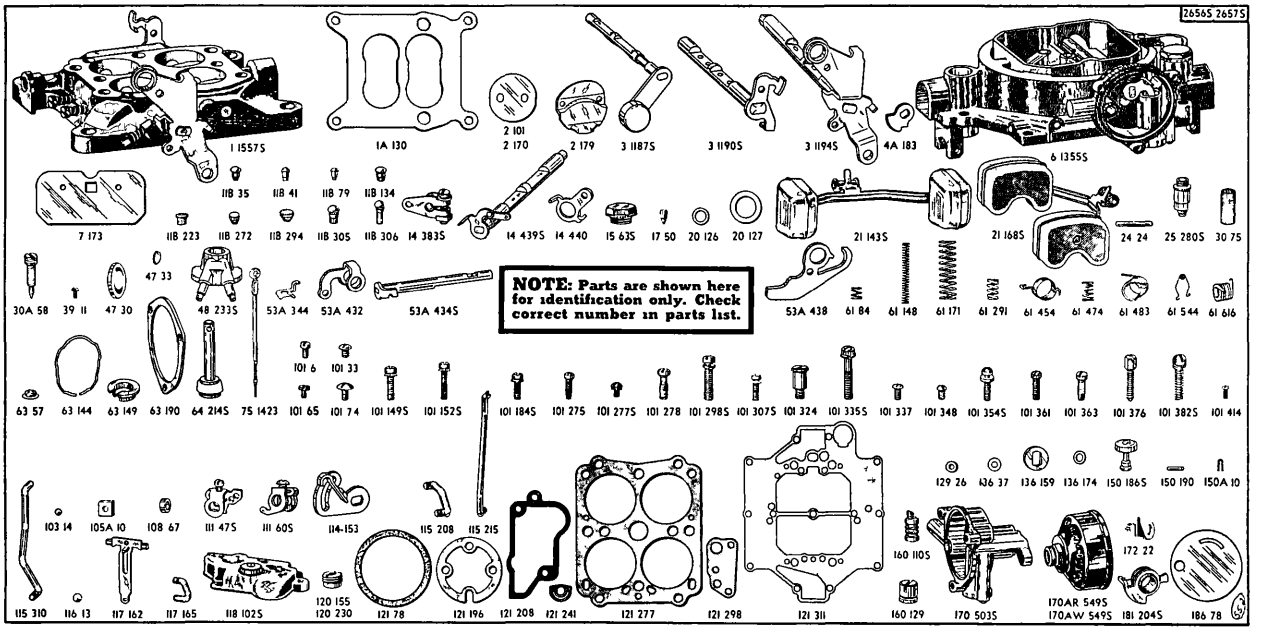
FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be 5/8 inch for primary floats and 3/4 inch for secondary floats. Adjust by bending stop tabs on float brackets.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever stop screw until throttle valves seat in bores on carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020 inch feeler (gauge T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever toward closed position—hold in place and tighten clamp screw. (b) With choke valve tightly closed bend fast idle adjusting tang until there is (2656S) .018 inch, (2657S) .015 inch (gauge T109-44) opening between throttle valve and bore of carbureter side opposite idle port. Be sure fast idle adjustment tang is on high step of cam while making this adjustment.

FAST IDLE ON CAR: (2656S) 1800 R. P. M., (2657S) 1600 R. P. M. hot engine with idle adjusting tang on high step of cam.



UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter. There should be 3/32 inch (gauge T109-125) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. Back out throttle lever stop screw so that primary valves seat in bores of carbureter. 3. With primary valves open 3/16 inch (gauge T109-28) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: Secondary valves will be a few degrees from wide open, when primary valves are wide open. With primary and secondary valves tightly closed there should be .010" to .030" (gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary throttle lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. **VERTICAL ADJUSTMENT:** With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109-232) for primary floats and 1/4 inch (gauge T109-223) for secondary floats. Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be 5/8 inch for primary floats and 3/4 inch for secondary floats. Adjust by bending stop tabs on float brackets.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever stop screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

FAST IDLE ADJUSTMENT: (a) loosen choke lever clamp screw on choke shaft. Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw. (b) With choke valve tightly closed bend fast idle adjusting tang until there is .015 inch (gauge T109-44) opening between throttle valve and bore of carbureter side opposite idle port. Be sure fast idle adjusting tang is on high step of cam while making this adjustment.

FAST IDLE ON CAR: 1800 R.P.M. hot engine with idle adjusting tang on high step of cam.

UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. Back out throttle lever stop screw so that primary valves seat in bores of carbureter. 3. With primary valves open 3/16" (gauge T109-28) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: Secondary valves will be a few degrees from wide open, when primary valves are wide open. With primary and secondary valves tightly closed there should be .017" to .022" (gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on primary throttle lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.

Chevrolet "V-8"—1957—Carbureter No. 2655S

WHEN SERVICING, USE GASKET ASSORTMENT No. 296

Part No.	PART NAME

(2626S) Front Carbureter

(2627S) Rear Carbureter

WCFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2626S-2627S**

CARBURETER SPECIFICATIONS

For Chevrolet 8 Cylinder Engine: 3⅞ Inch Bore, 3 Inch Stroke

Dimensions: Flange size 1⅛ inch Four Bore—4 bolt type
Primary venturi size 11/32 inch I D
Main venturi (primary) size 15/16 inch
Main venturi (secondary) size 1⅛ inch I D

Vents· (2627S) Outside (4) in air horn (4) in flange Inside (7)
(2626S) Outside none Inside (7)

Gasoline Intake. Size No 42 (0935 inch) drill hole in needle seat

Low Speed Jet Tube: (Primary side only)
Jet size No 68 (031 inch) drill
By pass in body size (049 inch) diameter
Economizer in screw plug size (049 inch) diameter
Idle bleed, in body size No 52 (0635 inch) drill

Idle Port: (Upper) slot type Primary length 174 inch width 030 inch Secondary none

Idle Port Opening· Primary 113 to 119 inch above top edge of valve with valve tightly closed Secondary none

Lower Port: Primary (for idle adjustment screw) size No 53 (0595 inch) drill Secondary none

Set Idle Adjustment Screw: ¼ to 1¼ turns open For richer mixture turn screw out Do not idle engine below 600 r p m (Power Glide in Drive Range)

Main Nozzle Installed permanently DO NOT REMOVE Anti percolating jet (primary in plug) size No 60 (040 inch) drill, (secondary in body) size No 60 (040 inch) drill

Metering Rod (Vacumeter Type). See parts list for size

Metering Rod Jet. Primary size 0935 inch diameter (for metering rod)
Secondary size 053 inch diameter (no metering rod)

Accelerating Pump Discharge jet (twin) primary side only size No 73 (024 inch) drill
Intake ball check seat size 115 to 120 inch diameter
Discharge needle seat size 070 inch diameter

Choke. (2627S only) Carter Climatic® Control set on index Butterfly type—offset choke valve, primary side only Choke heat suction hole, restriction in piston housing size No 43 (089 inch) drill

Vacuum Spark Port None

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .018"	Ignition Timing Breaker Points to Open 12° B.T.C. at Idle or 18° B.T.C. at 1000 R.P.M.	Float Setting Primary ⅛ Inch (Use Gauge T109-232) Secondary ¼ Inch (Use Gauge T109-223)	Idle Adjustment Screw Setting ¼ to 1¼ Idle Engine at 600 R.P.M. Power Glide in Dr. Range

NOTE. These cars equipped with Hydraulic Valve Lifters. NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made — lateral and vertical **LATERAL ADJUSTMENT** With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge Adjustment should be made by bending arms of floats **VERTICAL ADJUSTMENT** With float gauge in same position floats should just clear the horizontal portion of gauge Vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109 232) for primary floats and 1/4 inch (gauge T109 223) for secondary floats Adjust by bending float arms

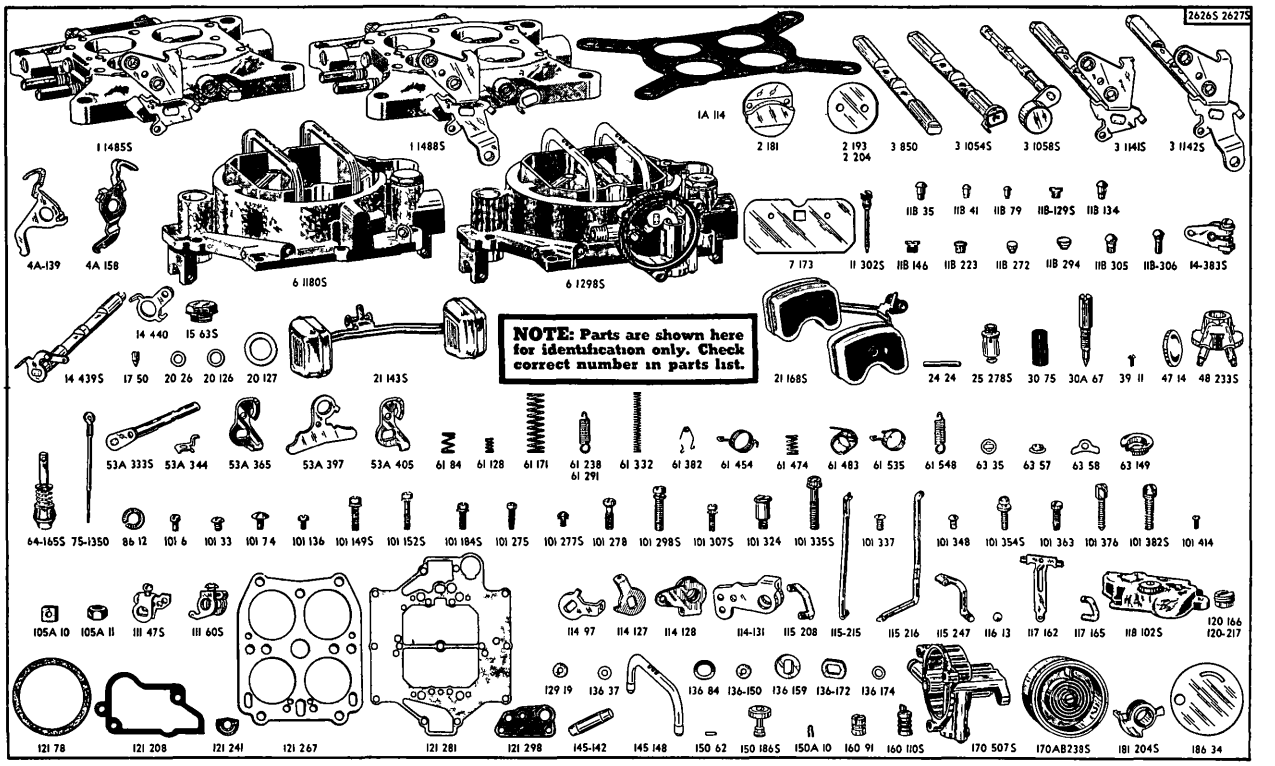
FLOAT DROP ADJUSTMENT With bowl cover held in upright position and measuring from center of float the distance be tween top of floats and bowl cover should be 5/8 inch for primary floats and 3/4 inch for secondary floats Adjust by bending stop tabs on float brackets

PUMP ADJUSTMENT Install pump connector link in inner hole (short stroke) of pump arm with ends extending toward counter shaft arm Back out throttle lever stop screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109 213)

METERING ROD ADJUSTMENT Metering rod adjustment is important and must be made after completing the pump ad ust ment No metering rod gauges are necessary Procedure is as follows 1 Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

FAST IDLE ADJUSTMENT (2627S only) (a) Loosen choke lever clamp screw on choke shaft Insert 020 inch feeler gauge (T109 29) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (b) With choke valve tightly closed bend fast idle adjusting tang until there is 018 inch (gauge T109 44) opening between throttle valve and bore of carbureter side opposite idle port Be sure fast idle adjusting tang is on high step of cam while making this adjustment

FAST IDLE ON CAR (2627S only) 1800 R P M hot engine with idle adjusting tang on high step of cam



UNLOADER ADJUSTMENT (2627S only) With throttle wide open there should be 1/8 inch (gauge T109 36) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109 41)

BOWL VAPOR VENT ADJUSTMENT This adjustment should be made after completing pump and metering rod adjustments Install dust cover and dust cover gasket Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter There should be 1/16 inch (gauge T109 197) between lower edge of bowl vapor vent valve and dust cover To adjust remove dust cover and bend vapor vent arm

SECONDARY THROTTLE LEVER ADJUSTMENT Primary and secondary throttle valves should reach wide open position at the same time NOTE Secondary throttle valves will be a few degrees from wide open To adjust bend throttle operating rod at upper angle (Use bending tool T109 213) With primary and secondary throttle valves in tightly closed position there should be 017 022 inch (gauge T109 29) clearance between positive closing shoes on primary and secondary throttle levers To adjust bend shoe on primary lever

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (2627S only) This adjustment should be made after completing fast idle and secondary throttle lever adjustments Crack throttle valves and hold choke valve tightly closed Then close throttle Tang on secondary throttle lever should freely engage in notch of lock out dog If necessary to adjust bend tang on secondary throttle lever

CARBURETER SPECIFICATIONS

For Chevrolet 8 Cylinder Engine 3 7/8 Inch Bore, 3 Inch Stroke

Dimensions Flange size 1 1/8 nch Four Bore—4 bolt type
Primary venturi size 11/32 inch I D
Main venturi (primary) size 1 inch
Main venturi (secondary) size 1 1/8 inch I D

Vents Outside (4) n air horn (4) in flange Inside (5) in air horn

Gasoline Intake Size No 42 (0935 inch) drill hole in needle seat

Low Speed Jet Tube (Primary side only)
Jet size No 68 (031 inch) drill
By pass in body size No 52 (0635 inch) drill
Economizer in screw plug size (049 inch) diameter
Idle Bleed in body size No 52 (0635 inch) drill

Idle Port (Upper) slot type Primary length 175 inch width 030 nch Secondary none

Idle Port Opening Primary 113 to 119 inch above top edge of valve with valve tightly closed Secondary none

Lower Port Primary (for idle adjustment screw) size No 53 (0595 inch) drill Secondary none

Set Idle Adjustment Screw 3/4 to 1 3/4 turns open For richer mixture turn screw out Do not idle engine below 425 R P M (Automatic Transmission—in Drive Range) 450 R P M (Standard and Overdrive Transmission)

Main Nozzle Installed permanently DO NOT REMOVE Anti percolating bleed (primary in plug) size No 60 (040 inch) drill (secondary in body) size No 66 (033 inch) drill

Metering Rod (Vacumeter type) see parts list for size

Metering Rod Jet Primary size 086 inch diameter (for metering rod)
Secondary size 076 inch diameter (no metering rod)

Accelerating Pump Discharge jet (twin) primary side only, size No 73 (024 inch) drill
Intake ball check seat size 115 to 120 inch diameter
Discharge needle seat size 070 inch diameter

Choke Carter Climatic® Control set on index Butterfly type —offset choke valve primary side only Choke heat suction hole restriction in piston housing size No 40 (098 inch) drill

Vacuum Spark Port Horizontal slot (round end) 045 x 110 inch Top of port 028 to 038 inch above valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. **VERTICAL ADJUSTMENT:** With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109-232) for primary floats and 1/4 inch (gauge T109-223) for secondary floats. Adjust by bending float arms.

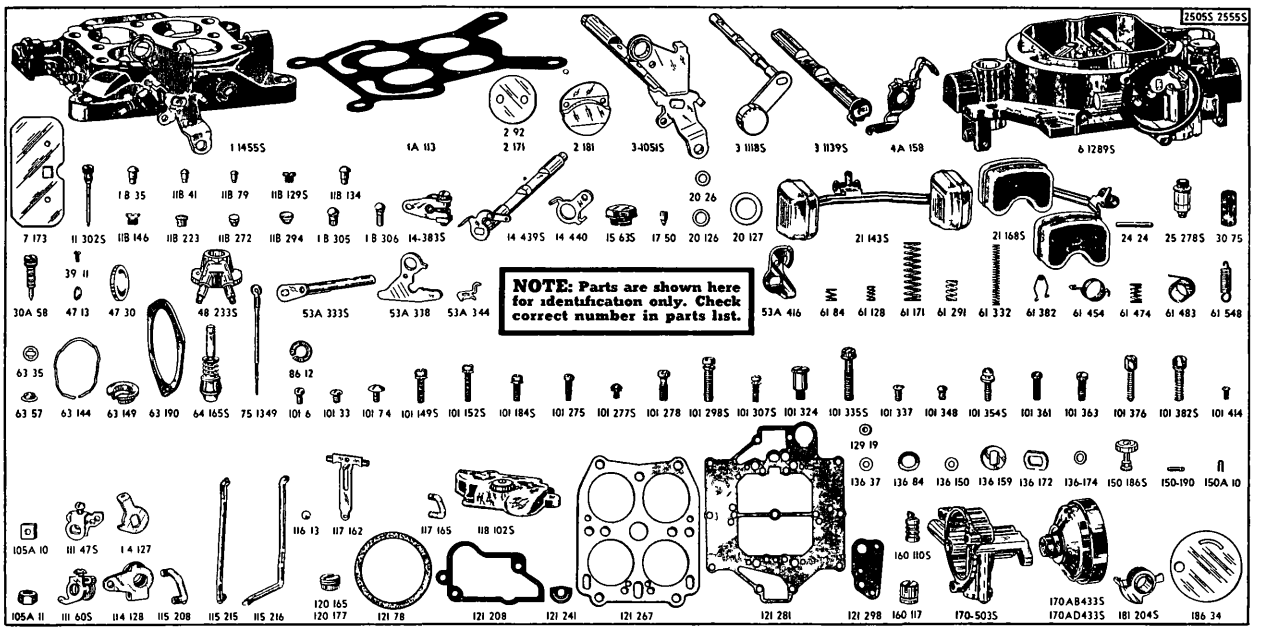
FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be 5/8 inch for primary floats and 3/4 inch for secondary floats. Adjust by bending stop tabs on float brackets.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever stop screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position — hold in place and tighten clamp screw. (b) With choke valve tightly closed bend fast idle adjusting tang until there is .015 inch (gauge T109-44) opening between throttle valve and bore of carbureter side opposite idle port. Be sure fast idle adjusting tang is on high step of cam while making this adjustment.

FAST IDLE ON CAR: (2505S-SA) 1800 (2555S) 1600 R.P.M. hot engine with idle adjusting tang on high step of cam.



UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. Back out throttle lever stop screw so that primary valves seat in bores of carbureter. 3. With primary valves open 3/16" (gauge T109-28) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: Secondary valves will be a few degrees from wide open, when primary valves are wide open. With primary and secondary valves tightly closed there should be .017" to .022" (gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on primary throttle lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.

CARBURETER SPECIFICATIONS

For Chevrolet Six Cylinder Engine (235 Cu In) 3 9/16 Inch Bore 3 15/16 Inch Stroke
For Chevrolet Six-Cylinder Engine (261 Cu In) 3¾ Inch Bore 3 15/16 Inch Stroke

Dimensions Flange size 1½ inch S A E
Throttle bore (745S 871S SA SB SC) 1 9/16 inch (2075S) 1 11/16 inch
Main venturi 1 3/16 inch I D
Air bleed through venturi to idle passage 0886 to 0906 inch diameter drill

Float Setting Top of float 0 to 1/32 inch below top surface of lower body

Vent Balance vent tube in air horn

Gasoline Intake Size No 38 (1015 inch) drill in needle seat

Idle Jet Tube Jet size No 68 (031 inch) drill

Idle Port Lower 062 to 064 inch diameter

Idle Port Opening Top of port located 005 to 009 inch below lower edge of valve

Upper Port (For Idle Adjustment Screw) 053 to 057 inch diameter

Set Idle Adjustment Screw ½ to 1½ turns open For richer mixture turn screw out Do not idle engine below 450 r p m

Main Metering Screw (745S 871S SA SB SC) Calibrated to flow 339 to 343 cc per minute (2075S) Calibrated to flow 366 to 370 cc per minute (Do not gauge for size If in doubt replace with new part)

Nozzle Inside diameter 150 152 inch

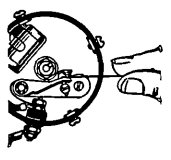
Accelerating Jets (12 344) 4—038 inch 2—055 inch diameter (12 505 early) 6—038 inch 4—055 inch (12 505 late) 6—040 inch 4—055 inch diameter

Air Bleed to Nozzle Vent tube size No 55 (052 inch) drill

Step Up Jet Power orifice size (745S 871S SA SB SC) No 64 (036 inch) drill (2075S) No 60 (040 inch) drill

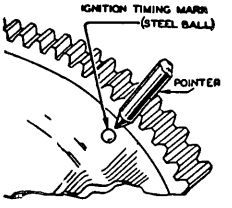
Accelerating Pump Pump intake check ball size ⅛ inch diameter Pump discharge retainer (in pump valve cage assembly) size 0635 inch diameter
Inner hole—short stroke
Outer hole—long stroke

Choke Butterfly type with poppet valve



Vacuum Spark Port Slot type 041 x 125 inch Top of port 000 to 004 inch below valve with valve tightly closed

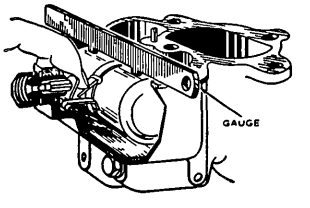
Motor Tune-Up—Be Accurate!



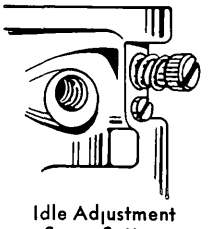
CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

Spark Plug Gap
035 '

Breaker Point Setting
018"



Ignition Timing Breaker Points to Open
5° B T D C



Valve Setting (Hot)
1950 57 (235 Cu In Eng)
Intake 006" to 008"
Exhaust 013" to 015"

1954 (261 Cu In Eng)
Intake 010"
Exhaust 020"

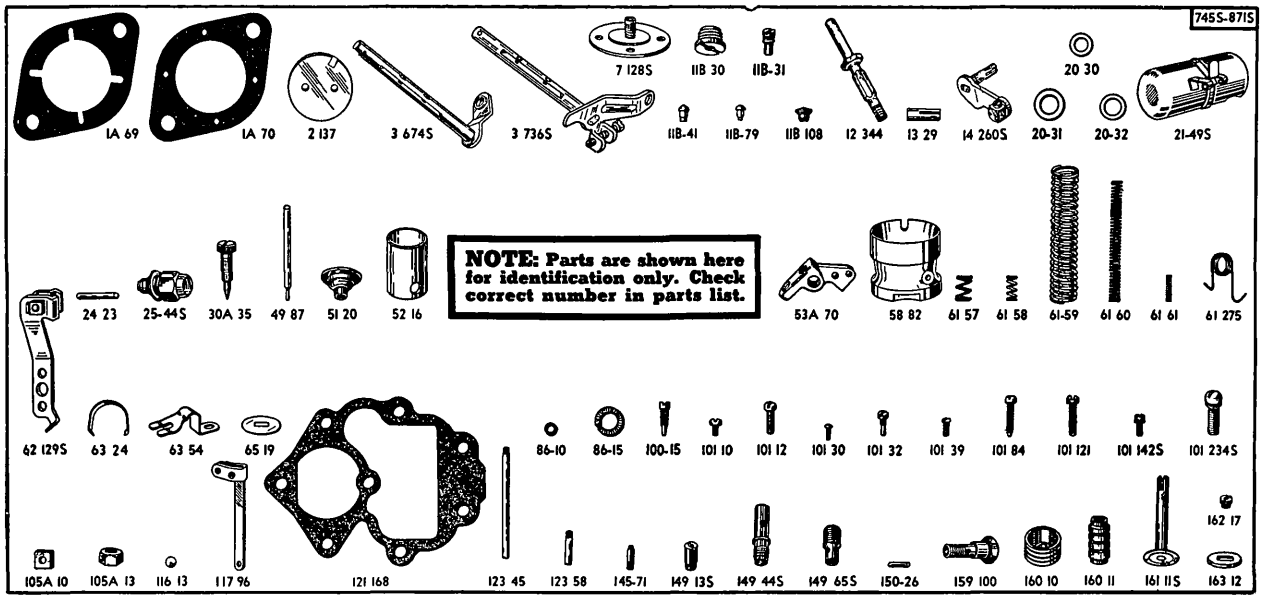
Float Setting (Use Gauge)
0 to 1/32 Inch

Idle Adjustment Screw Setting
½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

To Secure a Good Idle Set throttle lever adjusting screw so motor runs approximately 450 rpm Then set idle adjustment screw so motor fires evenly Correct setting will be found between ½ and 1½ turns open A richer mixture is obtained by backing out adjustment screw—a leaner mixture by turning screw in If motor stalls while idling remove idle passage tube and idle jet tube and clean with compressed air

To Improve Acceleration Examine pump link setting For winter driving link screw should be set in outer hole giving long stroke for hot weather in high altitudes pump link should be connected in inner hole giving short stroke If this does not give desired results the main metering jet pump metering jet check valve assembly and pump valve assembly should be removed and cleaned with compressed air



If Motor Loads—Check Float Level Wear on lip of float lever will raise float level from factory setting causing carbureter to load up To lower float level bend lip of float lever toward needle To raise float level bend lip away from needle A very slight bend is sufficient Be sure to bend lip of float not bracket

For Chevrolet Six-Cylinder Engine (261 Cu. In.): 3¾ Inch Bore, 3-15/16 Inch Stroke

Dimensions: Flange size 1½ inch S A E
Throttle bore, (745S 871S-SA-SB SC) 1-9/16 inch; (2075S) 1-11/16 inch
Main venturi 1-3/16 inch I D
Air bleed through venturi to idle passage 0886 to .0906 inch diameter drill

Float Setting: Top of float 0 to 1/32 inch below top surface of lower body.

Vent: Balance vent tube in air horn.

Gasoline Intake: Size No. 38 (.1015 inch) drill in needle seat

Idle Jet Tube: Jet, size No. 68 (.031 inch) drill.

Idle Port: Lower, .062 to .064 inch diameter

Idle Port Opening: Top of port located .005 to .009 inch below lower edge of valve

Upper Port (For Idle Adjustment Screw): .053 to .057 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Do not idle engine below 450 r p m

Main Metering Screw: (745S 871S-SA SB SC) Calibrated to flow 339 to 343 cc per minute (2075S) Calibrated to flow 366 to 370 cc per minute (Do not gauge for size If in doubt replace with new part)

Nozzle: Inside diameter .150-.152 inch

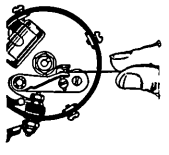
Accelerating Jets: (12 344) 4—.038 inch 2—.055 inch diameter (12 505 early) 6—.038 inch, 4—.055 inch, (12-505 late) 6—.040 inch 4—.055 inch diameter

Air Bleed to Nozzle: Vent tube, size No 55 (.052 inch) drill.

Step-Up Jet: Power orifice size (745S-871S SA-SB-SC) No 64 (.036 inch) drill (2075S) No 60 (.040 inch) drill

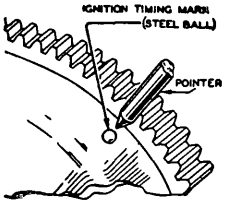
Accelerating Pump: Pump intake check ball size ⅛ inch diameter Pump discharge retainer (in pump valve cage assembly) size .0635 inch diameter
Inner hole—short stroke
Outer hole—long stroke

Choke: Butterfly type, with poppet valve.



Vacuum Spark Port: Slot type, .041 x .125 inch Top of port .000 to .004 inch below valve with valve tightly closed

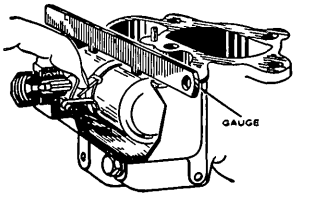
Motor Tune-Up—Be Accurate!



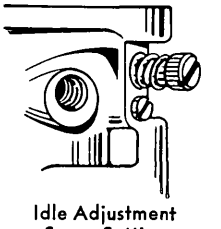
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter

Spark Plug Gap .035"

Breaker Point Setting .018"



Ignition Timing Breaker Points to Open: 5° B.T.D.C.



Valve Setting (Hot)
1950-57 (235 Cu. In. Eng.)
Intake .006" to .008"
Exhaust .013" to .015"

1954 (261 Cu. In. Eng.)
Intake .010"
Exhaust .020"

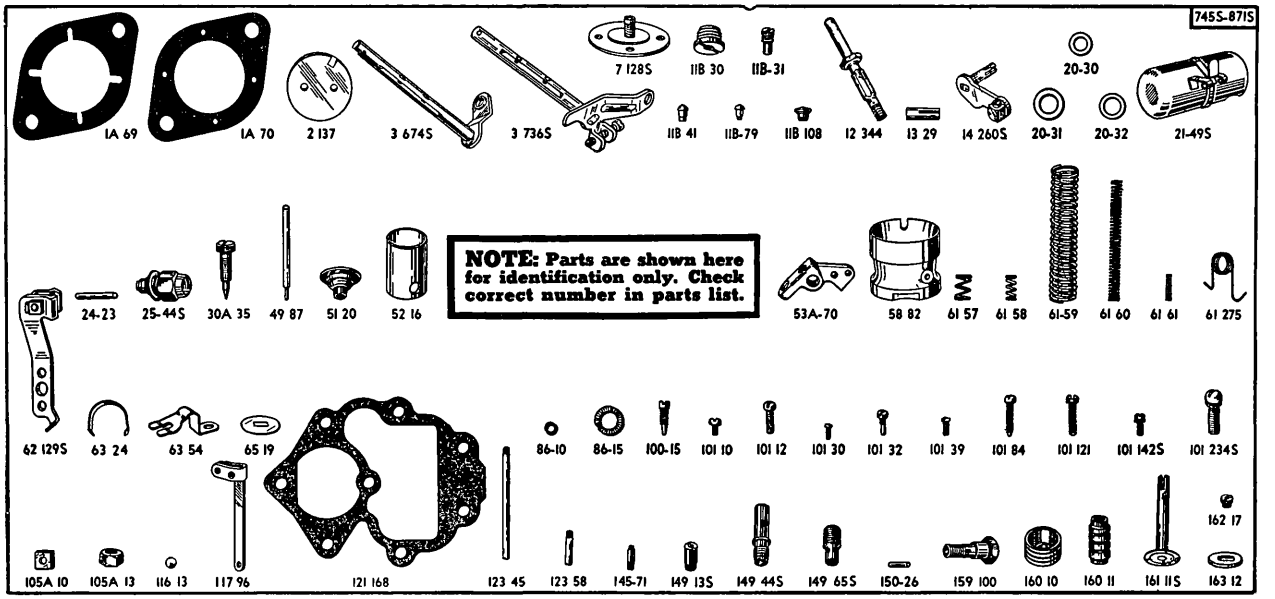
Float Setting (Use Gauge) 0 to 1/32 Inch

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

To Secure a Good Idle: Set throttle lever adjusting screw so motor runs approximately 450 rpm Then set idle adjustment screw so motor fires evenly Correct setting will be found between ½ and 1½ turns open A richer mixture is obtained by backing out adjustment screw—a leaner mixture by turning screw in If motor stalls while idling, remove idle passage tube and idle jet tube and clean with compressed air

To Improve Acceleration: Examine pump link setting For winter driving, link screw should be set in outer hole, giving long stroke, for hot weather, in high altitudes, pump link should be connected in inner hole, giving short stroke If this does not give desired results, the main metering jet, pump metering jet, check valve assembly and pump valve assembly should be removed and cleaned with compressed air.



If Motor Loads—Check Float Level: Wear on lip of float lever will raise float level from factory setting, causing carbureter to load up To lower float level, bend lip of float lever toward needle To raise float level, bend lip away from needle. A very slight bend is sufficient Be sure to bend lip of float, not bracket.

Economy
(a) Maximum economy is secured only when breaker points, spark plugs valves and motor timing are set to manufacturer s specifications
(b) Float level must be set as instructed above
(c) Step-up valve cage assembly should be examined Ball check in this assembly must seat and move freely When reassembling, valve cage must be screwed in tight against seat
(d) Step-up push rod must move freely in upper and lower guides
(e) Step-up piston in upper casting should not bind and must be free from dirt

756SA-789SA carbureters can be identified by part number stamped on flat horizontal surface of body just above flange.

YF Down-Draft Climatic® Control Carbs. **Nos. 756S-756SA-789S-789SA**

CARBURETER SPECIFICATIONS

(756S-756SA) Chevrolet 6 Cylinder Engine: 3½ Inch Bore, 3¾ Inch Stroke

(789S-789SA) Chevrolet 6 Cylinder Engine: 3-9/16 Inch Bore, 3-15/16 Inch Stroke

Dimensions: Flange size, (756S-SA) 1¼ inch S. A. E.
(789S-SA) 1½ inch S. A. E.
Primary venturi, 11/32 inch (8.73 mm) I. D.
Secondary venturi, 11/16 inch (17.46 mm) I. D.
Main venturi, (756S-SA) 1¼ inch (31.75 mm) I. D.
(789S-SA) 1-5/16 inch (33.34 mm) I. D.

Float Settings: See Float Adjustment (Fig. 1) and Float Drop (Fig. 2) Page 2.

Vents: Outside, none. Inside balance vent to air horn above choke valve.

Gasoline Intake: Spring loaded needle. Size No. 46 (.081 inch) (2.06 mm) drill in needle seat.

Low Speed Jet Tube: Jet size, No. 66 (.033 inch) (.84 mm) drill. By-pass in body, size (756S-SA) .065 inch (1.65 mm), (789S-SA) No. 53 (.0595 inch) (1.51 mm) drill. Economizer size (756S-SA) No. 54 (.055 inch) (1.40 mm) drill, (789S-SA) No. 55 (.052 inch) (1.32 mm) drill.

Idle Ports: Upper port: (756S-SA) slot type, length .185 inch (4.70 mm); width .040 inch (1.02 mm). (789S-SA) keyhole type, length .190 inch (4.83 mm); width .040 inch (1.02 mm); .086 (2.18 mm) diameter hole at top.
Lower port size (for idle adjusting screw): .0615 to .0655 inch (1.56 to 1.66 mm) diameter.

Idle Port Opening: Top of port (756S-SA) .166 to .170 inch (4.22 to 4.32 mm), (789S-SA) .143 to .147 inch (3.64 to 3.74 mm), above top edge of valve with valve tightly closed.

Set Idle Adjustment Screw: 1 to 2 turns open. For richer mixture, turn screw out. Do not idle engine below 350 r.p.m. (1941-48) or 450 r.p.m. (1949-51 standard transmission). On Power Glide set idle between 430 and 450 r.p.m. with transmission control in neutral position.

Main Nozzle: Nozzle is installed permanently. **DO NOT REMOVE.** Anti-percolator: drilled passage from anti-percolator well to nozzle.

Metering Rod: (756S-789S) Economy step .068 inch (1.73 mm) diameter; power step .052 inch (1.32 mm) diameter. (This rod is designed with flats on economy step). (756SA) Economy step .066 inch (1.68 mm) diameter; middle step tapers to .063 inch (1.60 mm) diameter, power step .043 inch (1.09 mm) diameter. (789SA) Economy step .073 inch (1.85 mm) diameter; power step .044 inch (1.12 mm) diameter.

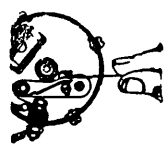
Metering Rod Jet: (756S-SA) .091 inch (2.31 mm), (789S) .095 inch (2.41 mm) diameter. (789SA) .1015 (2.58 mm) diameter.

Metering Rod Setting: See adjustments, Fig. 3, Page 2.

Accelerating Pump: Diaphragm type, vacuum and mechanically operated. Pump jet size (756S-789S) No. 72 (.64 mm) drill, (756SA-789SA) No. 75 (.53 mm) drill. Intake passage (in diaphragm housing) size No. 75 (.53 mm) drill. Vacuum restriction (in flange) size No. 55 (1.32 mm) drill. Vacuum passage (diaphragm bleed) size No. 65 (.89 mm) drill.

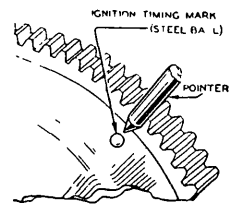
Pump Stroke: No adjustment.

Choke: Carter Climatic® Control—set one point lean. Valve, offset butterfly type. Choke heat suction in body, size No. 36 (.1065 inch) drill.



Vacuum Spark Port: Slot type. Size .125 by .041 inch (3.18 by 1.04 mm). Bottom of port (756S-SA) .022 to .032 (.56 to .81 mm) above top edge of valve with valve tightly closed. Top of port (789S-SA) .025 to .035 inch (.64 to .89 mm) above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

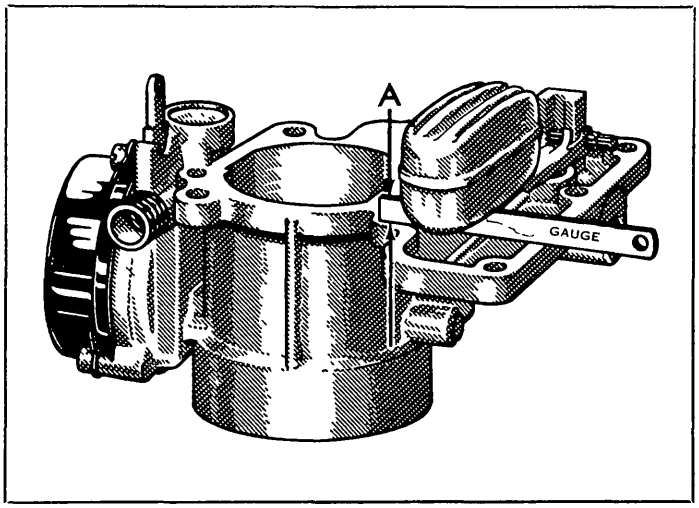

Figure 1
Float Adjustment

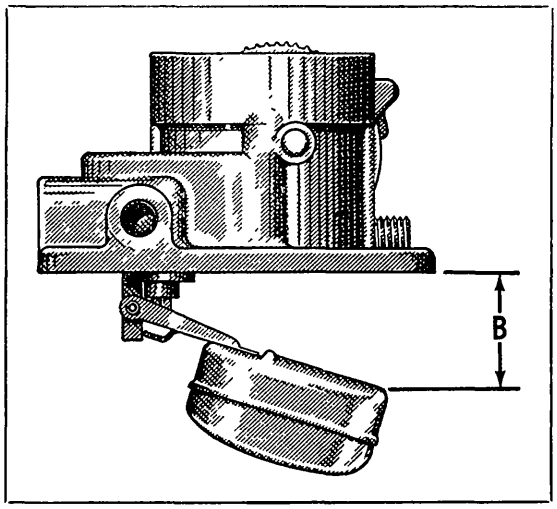

Figure 2
Float Drop

FLOAT ADJUSTMENT (Fig. 1):

With gasket removed, bowl cover assembly inverted and float resting on pin in seated needle, the distance (A) from the bowl cover to the top of float should be 5/16" (Gauge T109-107). Do not depress float lip against spring loaded pin in needle, but let float rest of its own weight. Adjust by bending lip of float, not float arm. Float setting must be checked with bowl cover held at eye height in a level position.

FLOAT DROP (Fig. 2):

With bowl cover assembly held in upright position, the distance (B) between free end of float and bowl cover should be 1¼ inch. Adjust by bending stop tabs on float arm.

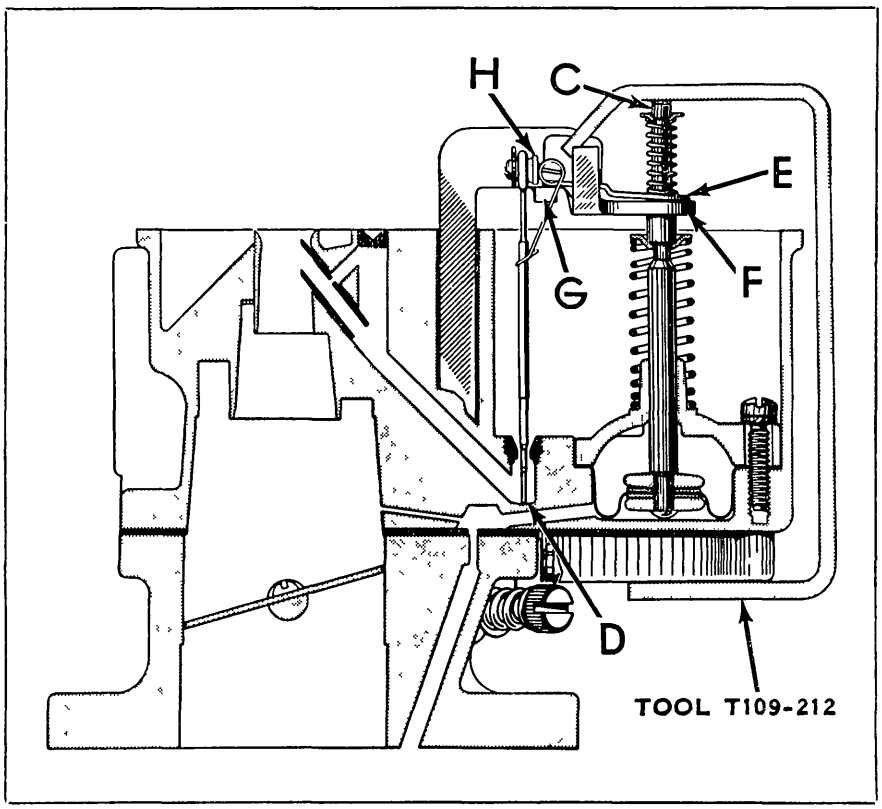

Figure 3
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 3):

This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed. With throttle valve seated in bore of carbureter, press down on upper end of diaphragm shaft (C) until diaphragm bottoms in vacuum chamber. (Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod).

Metering rod should contact bottom of metering rod well (D), and metering rod arm (E) should contact lifter link (F) between springs and at supporting lug (G). Adjust by bending lip (H) up or down.

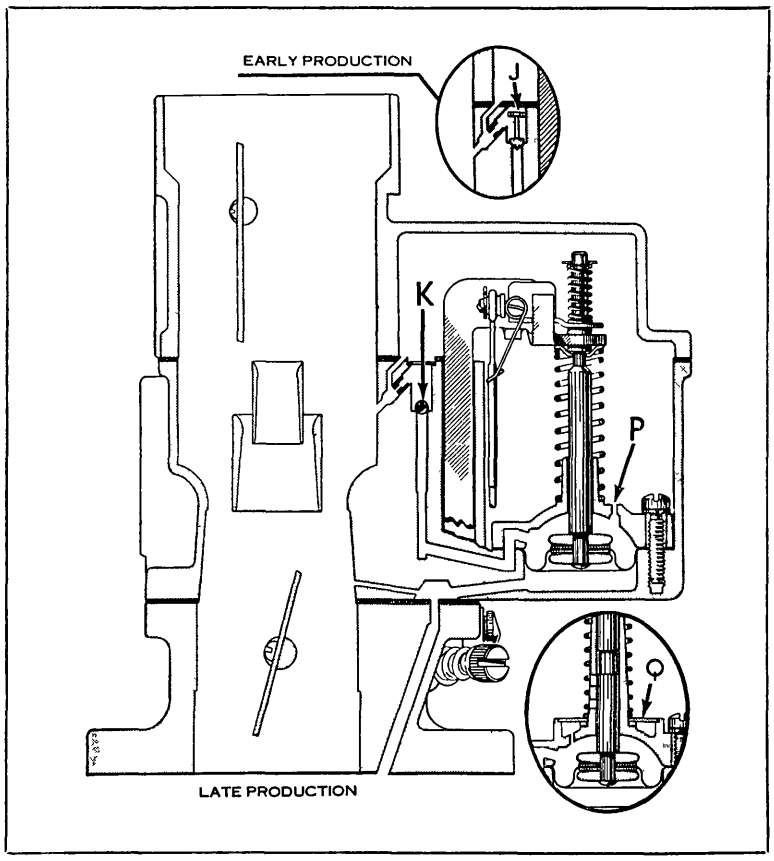

Figure 4
Accelerating Pump

ACCELERATING PUMP (Fig 4)

If acceleration is not satisfactory remove aluminum pump discharge check needle (J) or aluminum pump d scharge check ball (K) Then remove pump diaphragm assembly Check diaphragm for wear or damage Be sure inlet hole (P) is not clogged with lint or foreign matter Intake screen (Q, if so equipped) should be removed in service

If carbureter is equipped with needle type pump discharge check replace with alum num ball check Unitized package (Part No 116 26U) consisting of (1) 1/8 steel ball (1) 1/8 aluminum ball and (1) 63 152 retainer should be used Complete instructions for th s convers on are conta ned in the package If the discharge ball or seat in late produc tion carbureters originally equ pped with the aluminum ball check appear damaged 116 26U should be used Inspect and replace all worn or damaged parts and clean and blow out all passages w th compressed a r Make sure discharge check seats in casting as a leak at this point will result in poor ac celeration

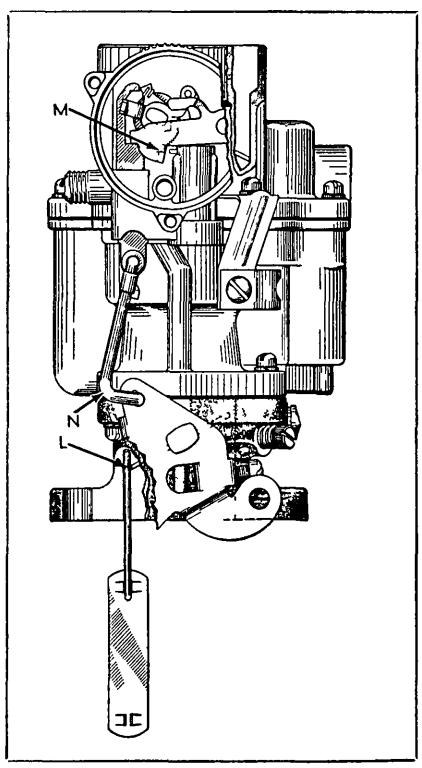

Figure 5
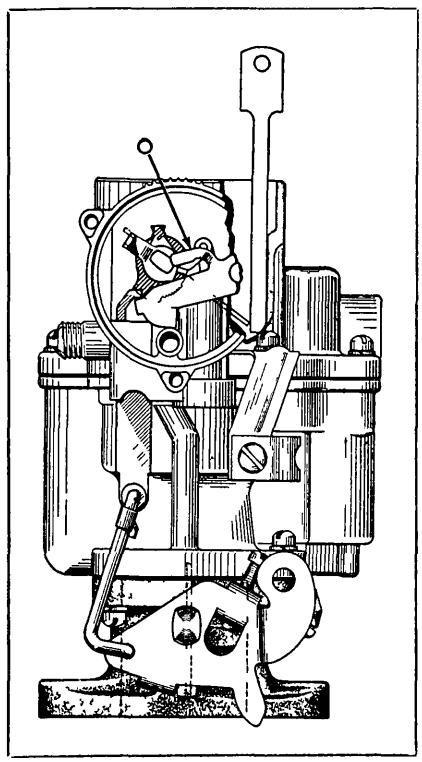
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig 5)

Crack throttle valve and hold choke valve closed With throttle valve closed choke trip lever should be on high step of fast idle cam (M) There should now be (756S SA) 076" (789S SA) 086" clearance (L) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle (N)



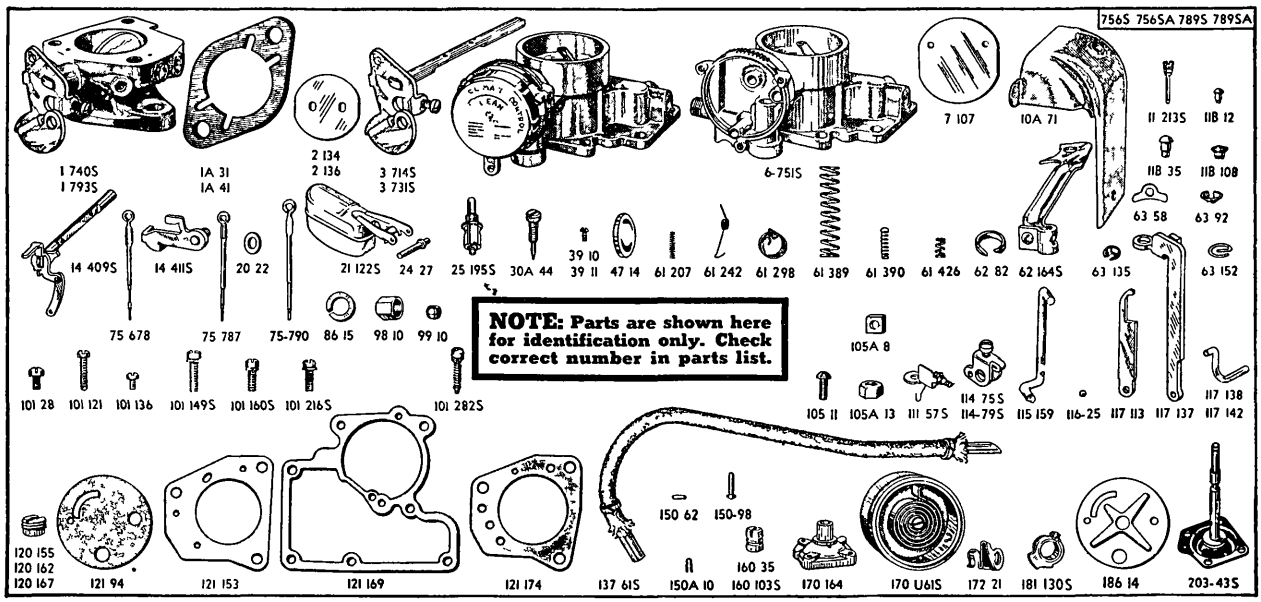


Figure 6
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig 6)

This adjustment must be made after the fast idle adjust ment With the thermostatic coil housing gasket and baffle plate removed hold throttle valve w de open and close choke valve as far as poss ble w thout forc ng there should now be 3/16" (Gauge T109 28) clearance between lower edge of choke valve and inner wall of a r horn Adjust by bending arm (O) on choke tr p lever (tool T109 187)

966S can be used in place of 788S-SA)

YF Down-Draft **Carbureters Nos. 787S-787SA-787SB-788S-788SA**

CARBURETER SPECIFICATIONS

(787S SA SB) Chevrolet 6 Cylinder Engine 3½ Inch Bore 3¾ Inch Stroke

(788S-SA) Chevrolet 6 Cylinder Engine 3-9/16 Inch Bore 3 15/16 Inch Stroke

Dimensions (787S SA SB) Flange size 1¼ inch S A E (788S 788SA) Flange size 1½ inch S A E Primary venturi 11/32 inch (8 73 mm) I D Secondary venturi 11/16 inch (17 46 mm) I D (787S SA SB) Main venturi 1¼ inch (31 75 mm) I D (788S 788SA) Main venturi 1 5/16 inch (33 34 mm) I D

Float Settings See Float Adjustment (Fig 1) and Float Drop (Fig 2) on Page 2

Vents Outside none Inside balance vent to air horn above choke valve

Gasoline Intake (787S) size No 48 (1 93 mm) drill in needle seat (787SA SB 788S SA) spring loaded needle Size No 46 (2 06 mm) drill in needle seat

Low Speed Jet Tube Jet size (787S SA SB) No 68 (79 mm) drill (788S 788SA) No 66 (84 mm) drill (787S SA SB) By pass in air horn size No 52 (1 61 mm) drill (788S 788SA) By pass in body size No 53 (1 51 mm) drill Economizer size (787S SA SB) No 54 (1 40 mm) drill (788S 788SA) No 55 (1 32 mm) drill

Idle Ports Upper port (787S SA SB) slot type length 174 to 176 inch (4 42 to 4 47 mm) width 040 inch (1 02 mm) (788S SA) keyhole type length 190 inch (4 83 mm) width 040 inch (1 02 mm) 086 inch (2 18 mm) diameter hole at top Lower port size (for idle adjusting screw) (787S SA SB) 053 to 057 inch (1 35 to 1 45 mm) diameter (788S SA) 0615 to 0655 inch (1 56 to 1 66 mm) diameter

Idle Port Opening Top of port (787S SA SB) 166 to 170 inch (4 22 to 4 32 mm) (788S SA) 153 to 157 inch (3 89 to 3 99 mm) above top edge of valve with valve tightly closed

Set Idle Adjustment Screw 1 to 2 turns open For richer mixture turn screw out Do not idle engine below 350 RPM (1941 48) or 450 RPM (1949 51)

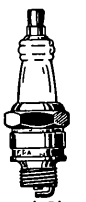
Main Nozzle Nozzle is installed permanently **DO NOT REMOVE** Anti percolator Drilled passage from anti percolator well to inside tip nozzle

Metering Rod (787S SA 788S) Economy step 068 inch (1 73 mm) diameter power step 052 inch (1 32 mm) diameter (This rod is designed with flats on economy step) (787SB) Economy step 066 inch (1 68 mm) diameter middle step tapers to 063 inch (1 60 mm) diameter power step 043 inch (1 09 mm) diameter (788SA) Economy step 073 inch (1 85 mm) diameter power step 044 inch (1 12 mm) diameter

Metering Rod Jet (787S SA SB) 091 inch (2 31 mm) (788S) 095 inch (2 41 mm) (788SA) 1015 inch (2 58 mm) diameter

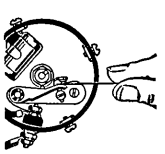
Metering Rod Setting See adjustments (Fig 3) Page 2

Accelerating Pump Diaphragm type vacuum and mechanically operated Pump jet size (787S SA 788S) No 72 (64 mm) drill (787SB 788SA) No 75 (53 mm) drill Intake passage (in diaphragm housing) size No 75 (53 mm) drill Vacuum restriction (in flange) size No 55 (1 32 mm) drill Vacuum passage (diaphragm bleed) size No 65 (89 mm) drill



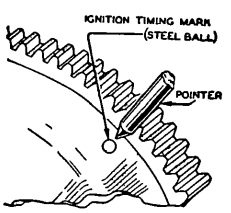
Pump Stroke No adjustment

Choke Manual interconnected with throttle Valve offset butterfly type



Vacuum Spark Port Slot type Size 125 by 041 inch (3 18 by 1 04 mm) Bottom of port (787S SA SB) 022 to 032 inch (56 to 81 mm) above top edge of valve with valve tightly closed Top of port (788S SA) 025 to 035 inch (64 to 89 mm) above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!



CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

CARBURETER ADJUSTMENTS

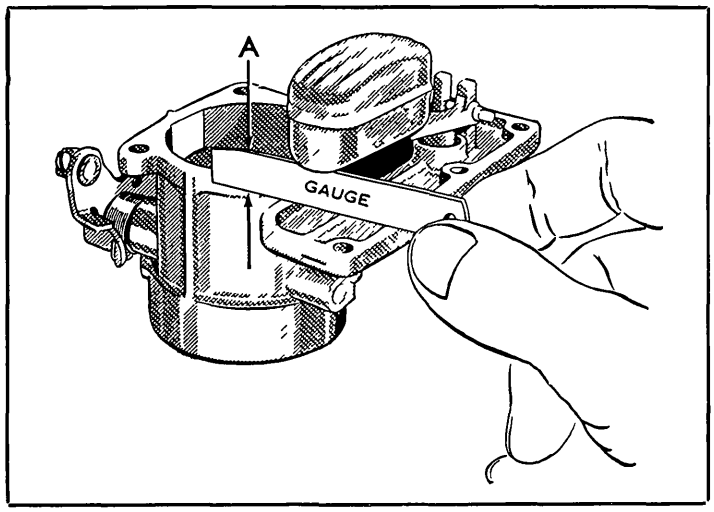

Figure 1
Float Adjustment

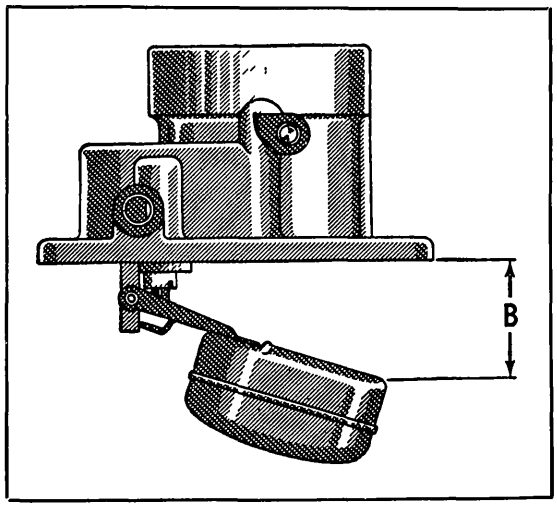

Figure 2
Float Drop

FLOAT ADJUSTMENT (Fig 1)

(787S) With gasket removed bowl cover assembly inverted and float resting on seated needle the distance (A) from the bowl cover to the top of float should be 1/2" (gauge T109 83) Adjust by bending lip of float not float arm

(787SA SB 788S SA) With bowl cover assembly inverted and float resting on pin in seated needle and with gasket removed the distance (A) from the bowl cover to the top of float should be 5/16" (gauge T109 107) Do not depress float lip against spring loaded pin in needle but let float rest of its own weight Adjust by bending lip of float not float arm Float setting must be checked with the bowl cover held at eye height in a level position

FLOAT DROP (Fig 2)

With bowl cover assembly held in upright position the distance (B) between free end of float and bowl cover should be 1 1/4" Adjust by bending stop tabs on float arm

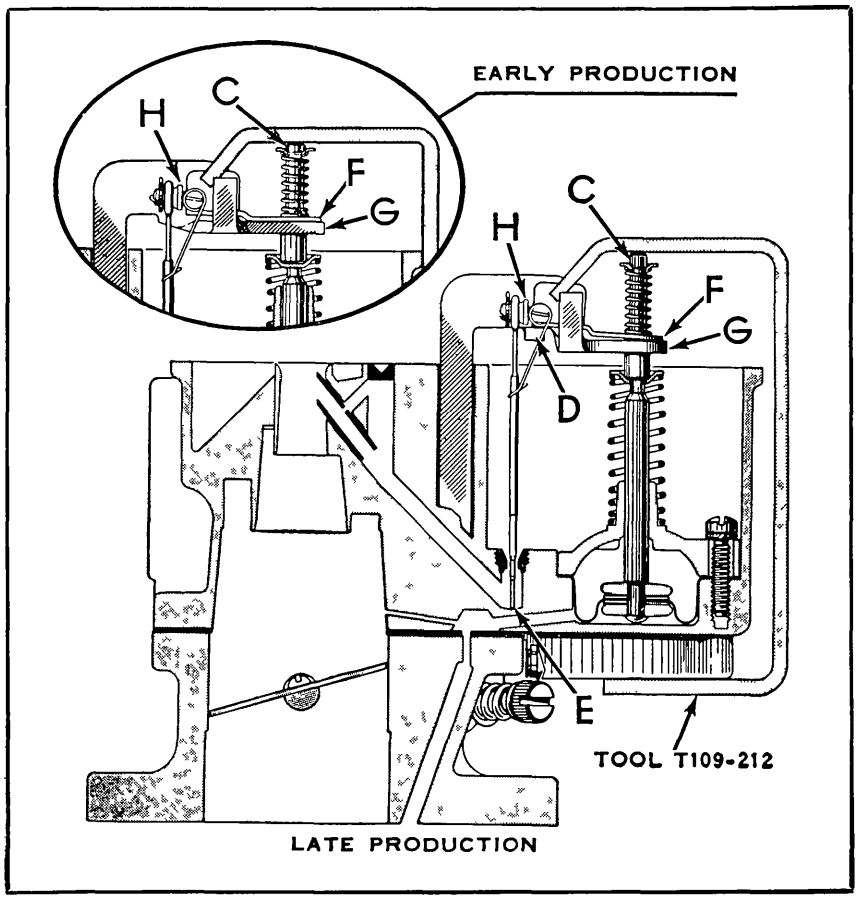

Figure 3
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig 3)

This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed With throttle valve seated in bore of carbureter press down on upper end of diaphragm shaft (C) until diaphragm bottoms in vacuum chamber (Tool T109 212 may be used to hold diaphragm shaft down while adjusting metering rod)

On late production 787S carbureters and 787SA 787SB 788S 788SA carbureters which have projection (D) on pump lifter link, metering rod should contact bottom of metering rod well (E) and metering rod arm (F) should contact lifter link (G) between springs and at supporting lug (D) Adjust by bending lip (H) up or down

On early production 787S carbureters, which **do not have** projection (D) on pump lifter link metering rod should bottom in metering rod well (E) and flat of metering rod arm (F) should make parallel contact with flat of pump lifter link (G) Adjust by bending lip (H) up or down

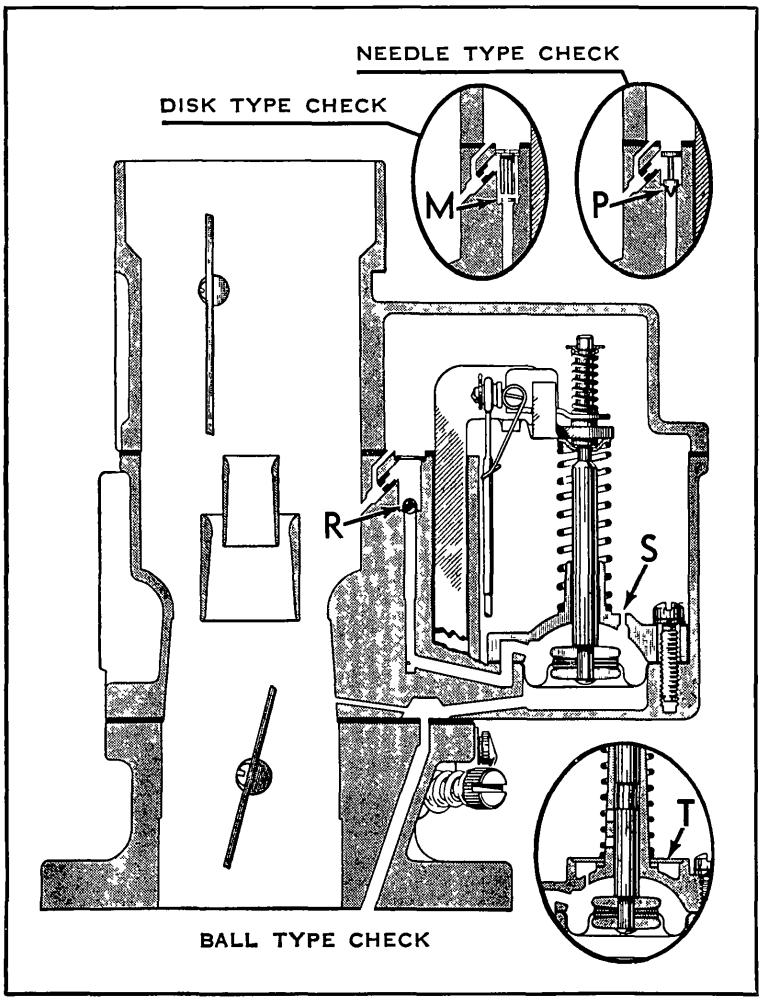

Figure 4
Accelerating Pump

ACCELERATING PUMP (Fig. 4):

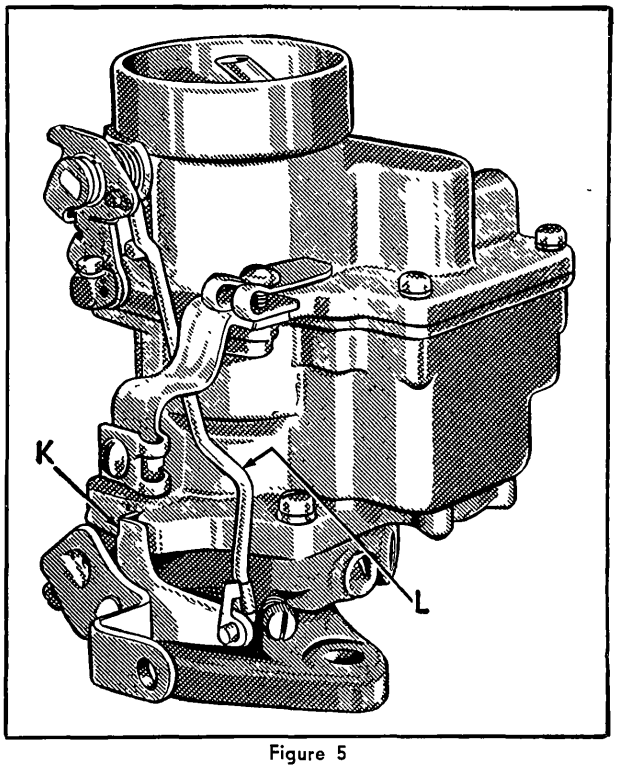
If acceleration is not satisfactory, remove pump check retainer and pump check disk (M) (787S), aluminum pump discharge check needle (P) or aluminum pump discharge check ball (R). Then remove pump diaphragm assembly. Check diaphragm for wear or damage. Be sure inlet hole (S) is not clogged with lint or foreign matter. Intake screen (T) (if so equipped) should be removed in service.

If carbureter is equipped with disk or needle type pump discharge check, replace with aluminum ball check. Unitized package (Part No. 116-26U), consisting of (1) 1/8" steel ball, (1) 1/8" aluminum ball and (1) 63-152 retainer should be used. Complete instructions for this conversion are contained in the package. If the discharge ball or seat in late production carbureters, originally equipped with the aluminum ball check, appear damaged, 116-26U should be used.

Inspect and replace all worn or damaged parts and clean and blow out all passages with compressed air. Make sure discharge check seats in casting as a leak at this point will result in poor acceleration.

FAST IDLE ADJUSTMENT (Fig. 5):

With choke held in wide open position, lip (K) of fast idle arm should contact boss on body casting. Adjust by bending at offset (L) of fast idle link.



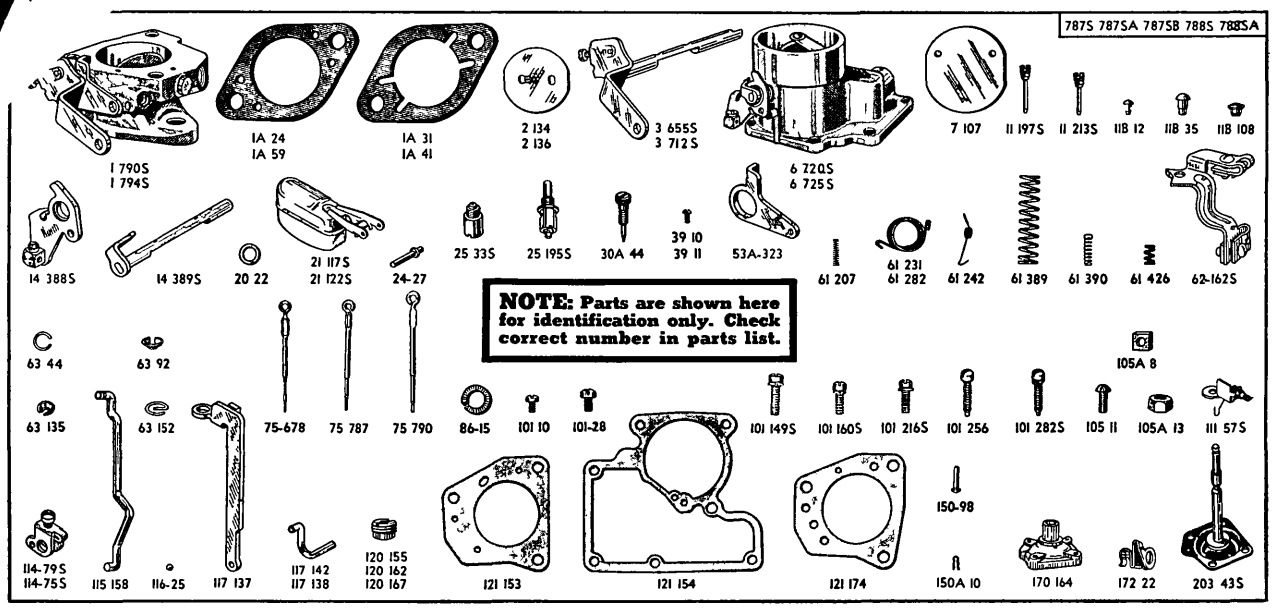


Figure 5
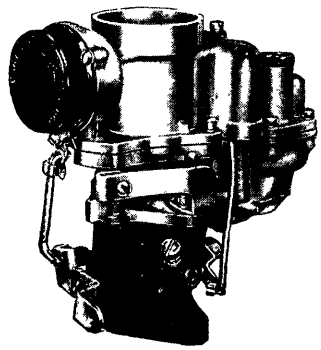
Fast Idle Adjustment

Chevrolet Carbureters Nos. 787S-787SA-787SB-788S-788SA



WHEN SERVICING, USE GASKET ASSORTMENT No 206A (787S SA SB) No 210B (788S-SA),
REPAIR PACKAGE No 1706 (787S SA SB), No 1708 (788S SA)

PART NAMES IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No.	PART NAME
1-790S	Body flange assembly (788S-788SA)
1-794S	Body flange assembly (787S-787SA-787SB)
1A-24	Flanget gasket (for use with governor) (788S-788SA)
1A-31	FLANGE GASKET (for use without governor) (788S-788SA)
1A-41	FLANGE GASKET (for use without governor) (787S-787SA-787SB)
1A-59	Flange gasket (for use with governor) (787S-787SA-787SB)
2-134	Throttle valve (787S-787SA-787SB)
2-136	Throttle valve (788S-788SA)
3-655S	Throttle shaft and lever assembly (787S-787SA-787SB) (Sup by 3-781S)
3-712S	Throttle shaft and lever assembly (788S-788SA) (Sup by 3-780S)
3-780S	Throttle shaft and lever assy (788S-788SA)
3-781S	Throttle shaft and lever assembly (787S-787SA-787SB)
6-720S	Air horn assembly (787S-787SA-787SB)
6-725S	Air horn assembly (788S-788SA)
7-107	Choke valve
11-197S	LOW SPEED JET ASSEMBLY (787S-787SA-787SB)
11-213S	LOW SPEED JET ASSEMBLY (788S-788SA)
11B-12	Flange passage plug
11B 35	Nozzle passage rivet plug
11B-108	IDLE PORT RIVET PLUG
14-388S	Choke lever assembly
14-389S	Choke shaft and lever assembly
17-80	Pump discharge check needle (787SA-788S) (Sup by 116-26U)
20-22	Needle seat gasket
21-117S	Float and lever assembly (787S)
21-122S	Float and lever assembly (787SA-787SB-788S-788SA)
24-27	Float lever pin
25-33S	NEEDLE AND SEAT ASSEMBLY (787S)
25-195S	NEEDLE SPRING, PIN AND SEAT ASSEMBLY (787SA-787SB-788S-788SA)
30-62	Pump intake strainer (787S-787SA-788S) (Discontinued)
30A-44	Idle adjustment screw
39-10	Choke valve attaching screw (2)
39-11	THROTTLE VALVE ATTACHING SCREW (2)
53A-323	Fast idle arm
61-84	Idle screw spring (787S) (Sup by 61-426)
61-207	Intake needle spring (787SA-787SB-788S-788SA)
61-231	Choke lever spring (787S-787SA-787SB)
61-242	Metering rod spring
61-282	Choke lever spring (788S-788SA)
61-389	PUMP DIAPHRAGM SPRING
61-390	Upper pump spring
61-426	Idle screw spring
62-162S	Choke tube clamp assembly
63-44	Choke lever retaining ring
63-92	DIAPHRAGM SPRING RETAINER
63-134	Pump disk retainer (787S) (Sup by 116-26U)
63-135	UPPER PUMP SPRING RETAINER
63-138	Pump disk retainer ring (787S) (Sup by 63-152)
63-139	Pump disk retainer (787S) (Sup by 116-26U)
63-152	Pump discharge ball check retainer ring (787S-787SB-788SA)
75-678	METERING ROD, STANDARD (787S-787SA-788S)
75-736	Metering rod, 1 size lean (787S-787SA-788S)
75-737	Metering rod 2 sizes lean (787S-787SA-788S)
75-787	METERING ROD, STANDARD (787SB)
75-788	Metering rod, 1 size lean (787SB)
75-789	Metering rod, 2 sizes lean (787SB)
75-790	METERING ROD, STANDARD (788SA)
75-795	Metering rod, 1 size lean (788SA)
75-796	Metering rod, 2 sizes lean (788SA)
86-15	Flange stud lock washer (2)
101-10	Wire clamp screw
101-28	Throttle shaft arm attaching screw
101-149S	Body flange attaching screw and washer assembly (3)
101-160S	Air horn attaching screw and washer assembly (5)
101-216S	Air horn attaching screw and washer assembly (2)
101-256	Throttle lever adjustment screw
101-282S	Diaphragm housing attaching screw and washer assembly (4)
105-11	Tube clamp screw (2)
105A-8	Tube clamp nut (2)
105A-13	Flange nut (2)
111-57S	Metering rod arm assembly
114-75S	THROTTLE SHAFT ARM ASSEMBLY
114-79S	Throttle shaft arm assembly (for velocity governor installation)
115-158	Fast idle connector rod
116-25	Pump discharge ball check
116-26U	UNITIZED PACKAGE (consists of (1) 116-11, (1) 116-25 and (1) 63-152)
117-137	PUMP LIFTER LINK
117-138	PUMP CONNECTOR LINK
117-142	Pump connector link (for velocity governor installation)
120-155	METERING ROD JET (787S-SA-SB)
120-162	METERING ROD JET (788SA)
120-167	METERING ROD JET (788S)
121-153	BODY FLANGE GASKET (787S-787SA-787SB)
121-154	BOWL COVER AND AIR HORN GASKET
121-174	Body flange gasket (788S-788SA) (Sup by 121-220)
121-184	Bowl cover and air horn gasket (788S) (Sup by 121-154)
121-220	BODY FLANGE GASKET (788S-788SA)
150-98	Intake needle pin (787SA-787SB-788S-788SA)
150A-10	PIN SPRING (2)
169-22	Pump check disk (787S) (Sup by 116-26U)
170-150	Pump diaphragm housing (787S) (Sup by 170-164)
170 164	Pump diaphragm housing
172-22	Connector rod retainer
203-43S	PUMP DIAPHRAGM ASSEMBLY

NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown, only one is used

CLIMATIC® CONTROL CARBURETER FOR CHEVROLET 730S—1941-1949

WE Down-Draft **Carbureter 730S** With Climatic® Control

CARBURETER SPECIFICATIONS

For Chevrolet Six Cylinder Engine: 3½ Inch Bore, 3¾ Inch Stroke

For Chevrolet Six Cylinder Engine: 3-9/16 Inch Bore, 3-15/16 Inch Stroke

Dimensions: Flange size 1¼ inch S A E
Primary venturi 11/32 inch I D
Secondary venturi 11/16 inch I D
Main venturi, 1¼ inch I D

Float Level: Distance from seam of float (at free end) to tip on lower edge of float chamber cover, when needle is seated to be ⅜ inch

Vents: Outside, No 10 drill Inside none

Gasoline Intake: Square vertical needle Size No 46 drill hole in needle seat

Low Speed Jet Tube: Jet size, No 69 drill (early production); No 68 drill (late production)
By-pass, size No 54 drill
Economizer, 059-060 inch diameter
Idle bleed size No 55 drill

Idle Port: Length, 165 inch width, 030 inch

Idle Port Opening: Top of port 112 116 inch above top edge of valve with valve tight closed

Idle Screw Seat: No 46 drill

Set Idle Adjustment Screw: ½ to 1½ turns open For richer mixture turn screw out Idle engine 450 r p m

Main Nozzle: In primary venturi, angle 45° Closed tip
Inside diameter No 30 drill
Upper hole 035 inch diameter on 45° angle
Lower hole 089 inch diameter on 60° angle

Metering Rod (Vacumeter Type): Economy step 072 inch diameter, middle step tapers to 061 inch diameter, power step 042 inch diameter Length 3-9/64 inches

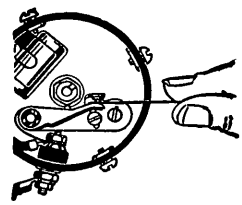
Metering Rod Jet: 095 inch diameter

Metering Rod Setting: Use gauge, part No T109 102 (2 468 inches)

Accelerating Pump: Pressure type (spring operated lever) with non-adjustable stroke
Pump discharge jet, size No 73 drill (early production), No 71 drill (late production)
Relief passage (to outside), size No 42 drill
Intake ball check seat size No 40 drill
Discharge ball check seat, size No 32 drill

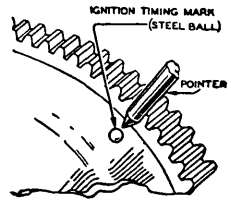
Pump Adjustment: 14/64 inch plunger travel full throttle position Use gauge No T109-117S

Choke: Carter Climatic® Control, set at index Butterfly type offset valve Choke heat suction hole in body, size No 36 (.1065") drill



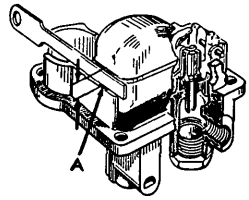
Vacuum Spark Port: 1005 to 1025 inch diameter Top of port 060 to 070 inch above top edge of valve

Motor Tune-Up—Be Accurate!

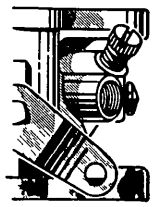


CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .040"



Breaker Point Setting .018"



Ignition Timing Breaker Points to Open: 5° B.T.D.C.

Valve Setting HOT
Intake .006"-.008"
Exhaust .013"-.015"

Float Setting (Use Gauge) ⅜ Inch (Measure from point "A" to top of float seam)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

THE 730S CLIMATIC® CONTROL
WE CARBURETER

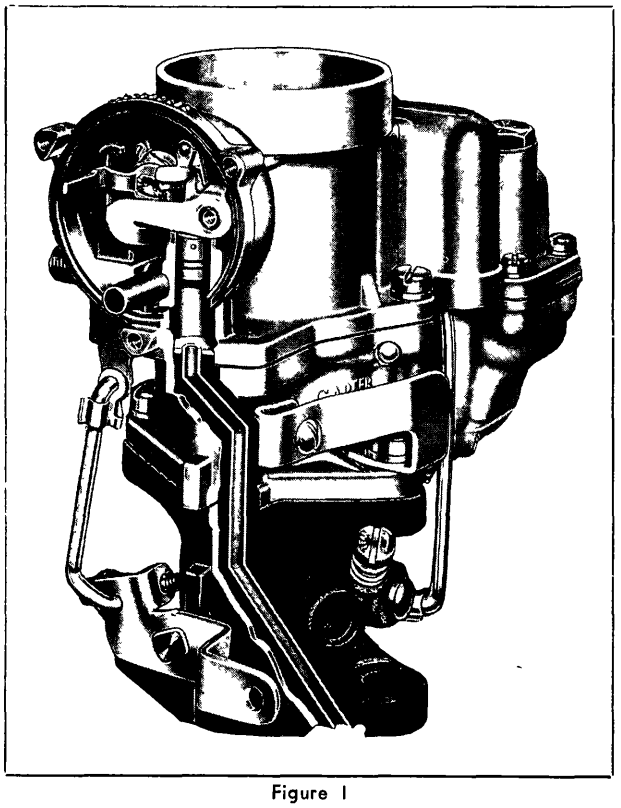

Figure 1

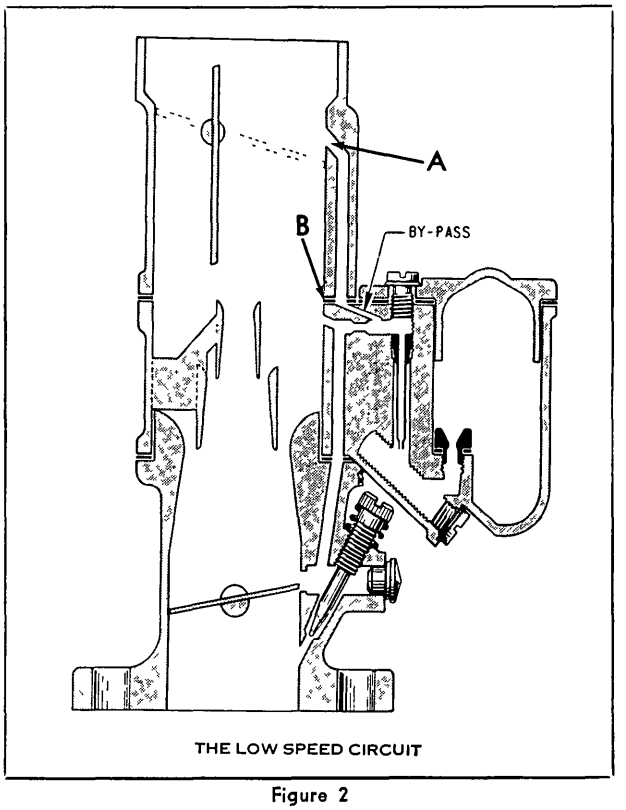

Figure 2

The Carter WE Carbureter is essentially the same as the Carter WA-1. However, there are several changes in the location of parts in the Climatic® control mechanism. The fast idle cam assembly, choke trip lever, unloader mechanism, etc., are located in the Climatic® control housing. In this way all these parts are protected from dirt and other foreign matter. (Fig. 1)

The by-pass of the low speed circuit (Fig. 2) is extended to a point above the closed choke valve (a). This produces a more uniform mixture for part throttle operation while the choke is closed or partly closed. Check to see that the air horn gasket does not leak at this point (b) and the calibrated by-pass in the upper surface of the body is clean.

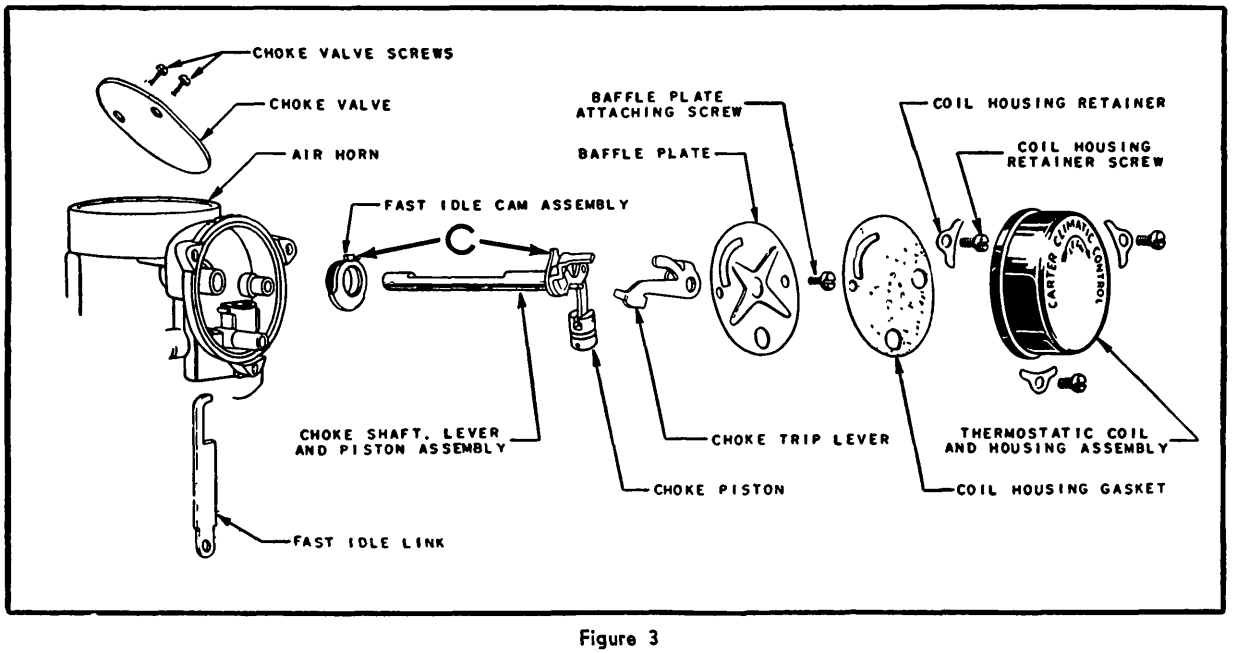

Figure 3

CLIMATIC® CONTROL ASSEMBLY

Slide fast idle cam assembly onto choke shaft Install choke shaft into air horn and revolve cam to allow piston to slide freely into cylinder Then lock fast idle cam spring ends around nib (c) of cam and projecting nib (c) of choke shaft assembly (Fig 3)

Install choke valve with trademark to top seating valve before tightening screws Valve must not bind in any position but fall free of its own weight Install fast idle link and choke trip lever Install choke connector rod in throttle lever before attaching to fast idle link Then install connector rod retainer

Fast idle and unloader adjustments should be made at this point before the balance of Climatic® control is assembled (Fig 4 and 5) Install baffle plate and attaching screw Install coil housing gasket With choke wide open hold coil housing with notch revolved one quarter turn clockwise from index mark on housing Place against housing and revolve counter clockwise to center index mark Lock in place with screws and retainer

CARBURETER ADJUSTMENTS

FLOAT SETTING

With bowl cover inverted and float lip resting on seated needle distance from soldered seam of float to small projection on machined surface of bowl cover should be 3/8" (use gauge T109 80) Adjustment should be made by bending lip of float lever After making float adjustment adjust stops on float bracket so free end of float can move 1/2" plus or minus 1/32"

PUMP ADJUSTMENT

Good acceleration depends primarily on the amount of gasoline discharged through the pump jet This quantity of pump discharge is controlled by the distance the pump plunger travels Pump travel adjustment should be made each time the carbureter is serviced and must be made before metering rod or anti percolator settings Procedure is as follows

(1) Back out throttle lever adjusting screw to allow throttle valve to seat in bore of carbureter
(2) Place pump travel gauge (tool T109 117S) on bowl cover with lip of gauge extending over top of plunger shaft
(3) Turn knurled nut of gauge until lip rests on top of plunger shaft with throttle valve seated Read number on gauge indicated by notch in knurled nut
(4) Repeat operation number 3 with throttle valve wide open
(5) The difference in the readings obtained at closed and at wide open throttle should be 14 (14/64") ADJUSTMENT IS MADE BY BENDING THROTTLE CONNECTOR ROD AT LOWER ANGLE

METERING ROD ADJUSTMENT

Correct setting of metering rod is important and must be made when reassembling carbureter or when leaner than standard rods are installed DO NOT DISTURB PUMP ADJUSTMENT

Remove metering rod and disc and install gauge T109 102 in place ot metering rod making sure lower end of gauge seats in metering rod jet Back out throttle lever set screw so throttle valve seats in bore of carbureter (Make sure fast idle cam does not hold throttle open Throttle valve must be seated) Press lightly on top of metering rod arm until upper lip of arm contacts pin in pump arm There should be less than 005" clearance between shoulder in notch of gauge and metering rod pin Adjust by bending upper lip on metering rod arm Use tool T109 105

This carbureter provides an added economy measure by means of the second lip on metering rod arm which extends below pin in pump arm and should be adjusted as follows

With throttle valve seated and finger pressing down on metering rod arm so that upper lip contacts pin on pump arm adjust lower lip for 3/16" clearance between bottom of pump arm pin and upper surface of lower lip (use gauge T109 28)

ANTI-PERCOLATOR ADJUSTMENT

Crack throttle valve 030 inch by placing (gauge T109 29) between throttle valve and bore of carbureter side opposite idle port There should now be 025 inch clearance between rocker arm lip and pump arm

Adjust by bending rocker arm

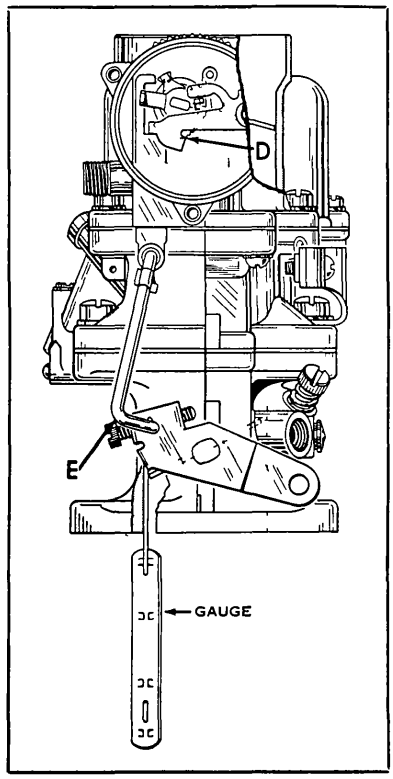

Figure 4

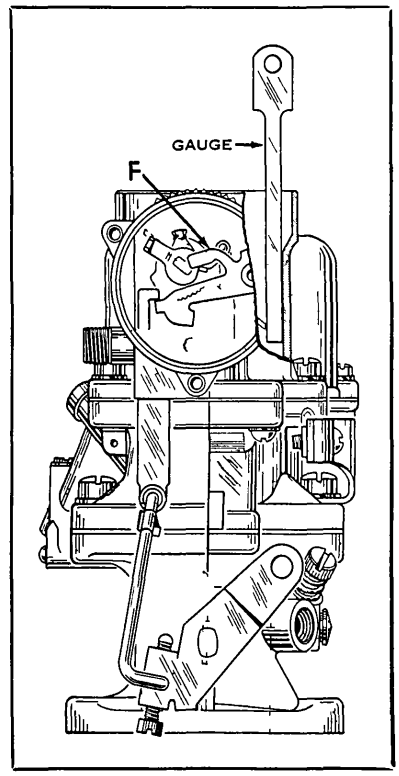
FAST IDLE ADJUSTMENT (Fig 4)

Remove thermostatic coil housing gasket and baffle plate Crack throttle valve and hold choke valve fully closed then close throttle This will allow fast idle cam to revolve to fast idle position (D)

With choke valve held tightly closed and slight tension on throttle lever there should now be 045 inch clearance between throttle valve and bore of carbureter side opposite idle port (gauge T109 158) Adjust by bending connector link at (E) Use bending tool T109 41

UNLOADER ADJUSTMENT· (Fig 5)

Must be made after fast idle adjustment Hold throttle valve in wide open position and close choke valve as far as possible without forcing There should be 3/16" clearance between lower edge of choke valve and inner wall of air horn (gauge T109 28) Adjust by bending arm (F) on choke trip lever use tool T109-187



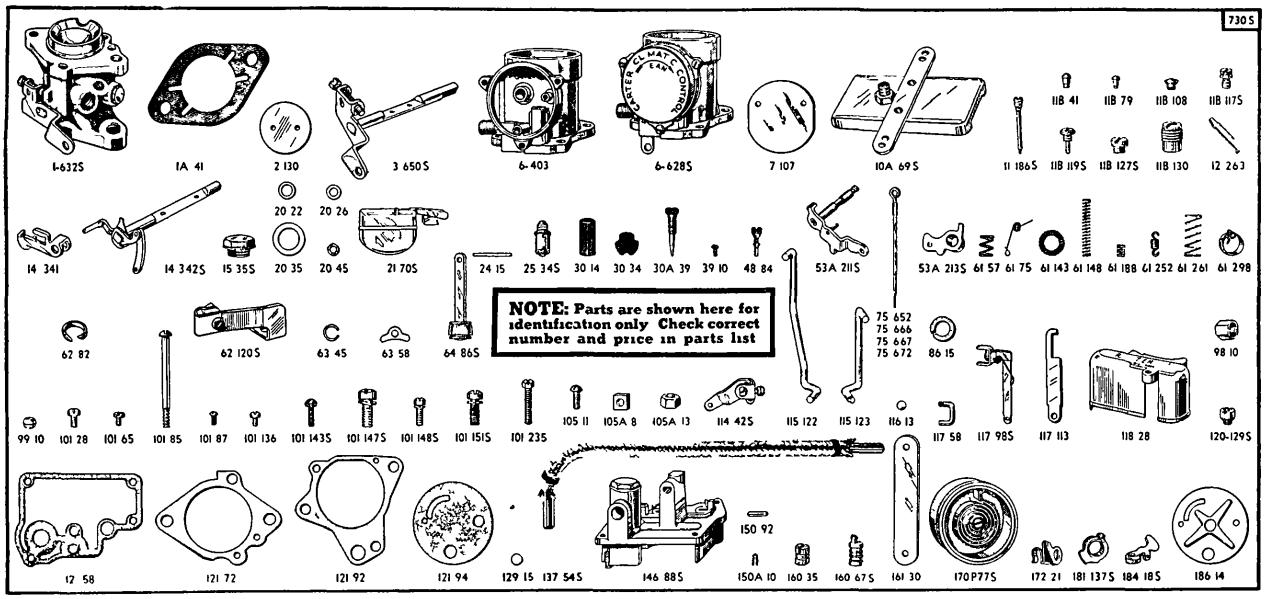


Figure 5

W-1 DOWN-DRAFT **CARBURETER No. 684S**

CARBURETER SPECIFICATIONS

For Chevorlet Six Cylinder Engine: 3½ Inch Bore, 3¾ Inch Stroke (1941-51)

For Chevrolet Six Cylinder Engine: 3-9/16 Inch Bore, 3-15/16 Inch Stroke (1941-49)

Dimensions: Flange size, 1¼ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1¼ inch I. D.

Float Level: Distance from float (at free end) to float chamber cover, when needle is seated, to be ½ inch plus or minus 1/64 inch.

Vents: Outside, none. Inside balance vent tube above choke valve.

Gasoline Intake: Square vertical needle. Size No. 48 drill hole in needle seat.

Low Speed Jet Tube: Vertical jet size, .035 inch diameter.
By-pass in body, size No. 51 drill.
Economizer jet, size .0545 to .0555 inch diameter.

Idle Ports: Upper port diameter, .086 inch.
Lower port diameter, .055 inch.

Idle Port Opening: Top of lower port .044 to .048 inch above top edge of valve, with valve closed tight.

Idle Screw Seat: Size No. 52 drill.

Set Idle Adjustment Screw: 1 to 2 turns open. For richer mixture, turn screw out. Do not attempt to idle engine below 350 r. p. m.

Outer Nozzle: In primary venturi, angle 30°. Discharge size, .125 inch diameter.

Inner Nozzle: (Seats in outer nozzle) .120 inch I. D.

Metering Rod: Economy step .067 inch diameter. Second step tapers to .062 inch diameter. Third step tapers to .060 inch diameter. Power step .046 inch diameter. Length 3⅜ inches

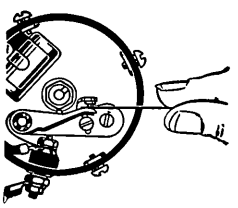
Metering Rod Jet: Size .093 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-25 (2.795 inches).

Accelerating Pump: Pressure type with non-adjustable stroke.
Discharge jet, size No. 72 drill.
Intake disk check plug, size No. 40 drill.
Discharge disk check plug, size No. 40 drill.

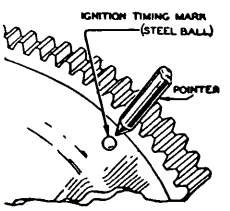
Choke: Manual—butterfly type, offset valve.

Throttle Valve: Opens to within 0° to 3° from perpendicular. Interconnected throttle and choke to open throttle valve to fast idle position.



Vacuum Spark Port: Slot type: size, .041 to .125 inch. Bottom of port .000 to .004 inch above top of valve

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service float level should be checked Wear on lip of float lever will raise float level Float level may be reset by bending lip of float lever down to raise float level or bending lever up to lower float level Only a very slight bend is needed

If motor stalls while idling, reset idle adjustment screw and throttle lever adjusting screw If these adjustments do not correct the trouble, remove low speed jet tube and clean thoroughly with compressed air Examine and see that tube seats gasoline-tight in body casting top and bottom If not replace with a new tube of identical specifications NEVER CHANGE A LOW SPEED JET TUBE FROM ONE CARBURETER TO ANOTHER

Poor acceleration may be due to clogged pump jet, damaged or worn plunger leather or dirt in the pump cylinder and pump check valves Clean pump jet and passages with compressed air Replace pump jet, check valves and pump plunger assembly to assure acceleration The pump jet and check valves must seat gasoline-tight When installing pump plunger assembly always use loading cylinder (T52-15) to prevent damage to plunger leather

(517S can be used in place of 489S)

BB UP DRAFT CARBURETERS—Nos. 489S-517S-699S

CARBURETER SPECIFICATIONS

For Chevrolet Six-Cylinder Engine (3 1/2-inch Bore, 3 3/4-inch Stroke) (3-9/16-inch Bore, 3-15/16-inch Stroke)

Dimensions: Flange size, 1 1/4 inch (31.75 mm).
(489S) Throttle bore, 1-7/16 inch (36.51 mm).
(517S-699S) Throttle bore, 1 1/2 inch (38.10 mm).
(489S) Main venturi, 1 inch I.D. (25.40 mm).
(517S-699S) Main venturi, 1-1/16 inch I. D. (26.99 mm).
Air bleed through venturi, to idle passage .0885 to .0905 inch diameter (2.25 to 2.30 mm) drill.

Float Setting: Top of float 1/32 to 1/16 inch (.79 to 1.59 mm) below top of surface of lower body.

Balance Vent Tube: Inside diameter, 7/32 inch (5.56 mm).

Gasoline Intake Needle: Triangular, horizontal. No. 38 (2.58 mm) drill in needle seat.

Idle Jet Tube: (489S-517S) Jet size, .0236 inch (.60 mm) drill, (699S) .025 inch (.635 mm).

Idle Ports: Lower port size: .062 to .064 inch (1.58 to 1.63 mm) diameter. Top of port located .005 to .009 inch (.13 to .23 mm) below lower edge of valve. Upper port size: .053 to .057 inch (1.35 to 1.45 mm) diameter (for idle adjustment screw).

Set Idle Adjustment Screw: 1/2 to 1 1/2 turns open. For richer mixture, turn screw out. Do not idle engine below 300 r.p.m. or 6 m.p.h.

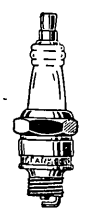
Main Metering Screw: (489S) Calibrated to flow 268 to 272 cc per minute; (517S) 366 to 370 cc per minute; (699S) calibrated to flow 352 to 356 cc per minute. (Do not gauge for size. If in doubt, replace with new part.)

Nozzle: (489S) No. 33 (2.87 mm) drill, I. D. (30°).
(517S) No. 33 (2.87 mm) drill, I. D. (24°).
(699S) .125 inch (3.175 mm) drill, I. D. (24°).

Accelerating Jets: (489S) 2—.0394 inch (1.00 mm) drill 1/16 inch (1.59 mm) from shoulder.
1—.051 inch (1.3 mm) drill 3/8 inch (9.525 mm) from shoulder.
1—.063 inch (1.6 mm) drill 23/32 inch (18.256 mm) from shoulder.
1—.051 inch (1.3 mm) drill 1-1/16 inch (26.99 mm) from shoulder.
(517S-699S) 2—.038 inch (.97 mm) drill 1/16 inch (1.59 mm) from shoulder.
2—.038 inch (.97 mm) drill 3/8 inch (9.525 mm) from shoulder.
2—.038 inch (.97 mm) drill 23/32 inch (18.256 mm) from shoulder.
(517S) 2—.038 inch (.97 mm) drill 1-1/16 inch (26.99 mm) from shoulder.
(699S) 2—.052 inch (1.32 mm) drill 1-1/16 inch (26.99 mm) from shoulder.

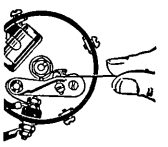
Air Bleed to Nozzle: (489S) (Vent tube) Size, .0394 inch (1.00 mm) drill.
(517S) (Vent tube) Size, .048 inch (1.22 mm) drill.

Step-up Jet: (489S) (Power Orifice) Size, .038 inch (.965 mm) drill; (517S) Size, .055 inch (1.40 mm) drill; (699S) Size, .043 inch (1.092 mm) drill.



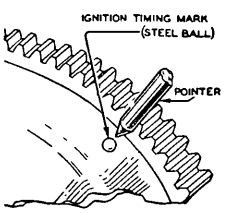
Accelerating Pump: Type, low pressure, delayed action. Stroke: Summer setting, inner hole, short stroke 9/16 inch (14.29 mm). Winter setting (outer hole, long stroke) 1 inch (25.40 mm). Pump intake ball check: Size 1/8 inch (3.175 mm). Pump discharge retainer (in pump valve cage assembly) .0635 inch diameter (1.615 mm) drill size.

Choke: Butterfly type, with poppet valve.



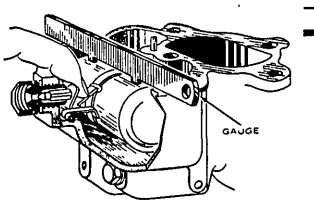
Vacuum Spark Port: Slot type, .041 x .125 (1.041 x 3.175 mm). Top of port .000 to .004 inch (.0 to .1016 mm) below valve.

Motor Tune-Up—Be Accurate!

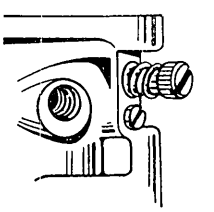


CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .040"



Breaker Point Setting .018"



Ignition Timing
Breaker Points to Open:
5° B.T.D.C.

Valve Setting (Hot)
Intake .006" to .008"
Exhaust .013" to .015"

Float Setting (Use Gauge)
1/32 to 1/16 Inch

Idle Adjustment Screw Setting 1/2 to 1 1/2 Turns Open

CARBURETER ADJUSTMENTS

To Secure a Good Idle: Set throttle lever adjusting screw so motor runs approximately 300 rpm. Then set idle adjustment screw so motor fires evenly. Correct setting will be found between 1/2 and 1 1/2 turns open. A richer mixture is obtained by backing out adjustment screw—a leaner mixture by turning screw in. If motor stalls while idling, remove idle passage tube and idle jet tube and clean with compressed air.

To Improve Acceleration: Examine pump link setting: For winter driving, link screw should be set in outer hole, giving long stroke; for hot weather, in high altitudes, pump link should be connected in inner hole, giving short stroke. If this does not give desired results, the main metering jet, pump metering jet, check valve assembly and pump valve assembly should be removed and cleaned with compressed air.

If Motor Loads—Check Float Level: Wear on lip of float lever will raise float level from factory setting, causing carbureter to load up. To lower float level, bend lip of float lever toward needle. To raise float level, bend lip away from needle. A very slight bend is sufficient. Be sure to bend lip of float, **not** bracket.

Economy: (a) Maximum economy is secured only when breaker points, spark plugs, valves and motor timing are set to manufacturer's specifications.
(b) Float level must be set as instructed above.

616S—FLEET ECONOMY MODEL

Casting No. 432 on face of flange.

CHEVROLET CARBURETER No. 616S 1946-1948

(2008S can also be used)

W-1 DOWN-DRAFT CARBURETER—**No. 616S**

CARBURETER SPECIFICATIONS

For Chevrolet Six Cylinder Engine: 3½ Inch Bore, 3¼ Inch Stroke

Dimensions: Flange size, 1¼ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1-1/16 inch I. D.

Float Level: Distance from float (at free end) to float chamber cover, when needle is seated, to be ½ inch plus or minus 1/64 inch.

Vents: Outside, none. Inside balance vent tube above choke valve.

Gasoline Intake: Square vertical needle. Size No. 48 drill hole in needle seat.

Low Speed Jet Tube: Vertical jet size .025 inch diameter.
By-pass in body, size No. 56 drill.
Economizer jet, size .0545 to .0555 inch diameter.

Idle Ports: Upper port diameter, .086 inch diameter. Lower port diameter, .055 inch diameter.

Idle Port Opening: Top of lower port .044 to .048 inch above top edge of valve, with valve closed tight.

Idle Screw Seat: Size No. 52 drill.

Set Idle Adjustment Screw: 1¼ to 2¼ turns open. For richer mixture, turn screw out. Do not attempt to idle engine below 350 r. p. m.

Outer Nozzle: In primary venturi, angle 30°. Discharge size, .125 inch diameter.

Inner Nozzle: (Seats in outer nozzle) .120 inch I. D.

Nozzle Retainer Plug: Jet size, .0595 inch diameter.

Metering Rod: Economy step .0645 inch diameter. Second step .063 inch diameter. Third step tapers to .061 inch diameter. Power step .046 inch diameter. Length 3⅜ inches.

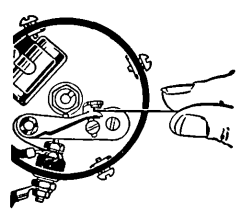
Metering Rod Jet: Size, .0835 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-25 (2.795 inches).

Accelerating Pump: Low pressure type with non-adjustable stroke.
Discharge (pump) jet, size .025 inch diameter.
Intake disk check plug, size No. 62 drill.
Discharge disk check plug, size No. 40 drill.

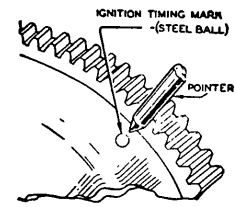
Choke: Manual—butterfly type, offset valve.

Throttle Lever: Restricts maximum speed to approximately 60 m. p. h.

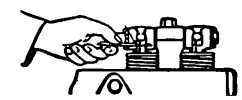


Vacuum Spark Port: Slot type: size, .041 to .125. Bottom of port .000 to .004 above top of valve.

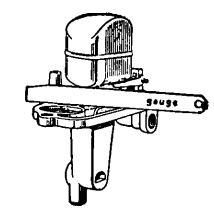
Motor Tune-Up—Be Accurate!



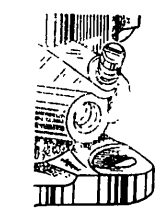
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .040"



Breaker Point Setting .018"



Ignition Timing Breaker Points to Open: 5° B.T.D.C.

Valve Setting HOT
Intake .006"-.008"
Exhaust .013"-.015"

Float Setting (Use Gauge) ½ Inch

Idle Adjustment Screw Setting 1¼ to 2¼ Turns Open

CARBURETER ADJUSTMENTS

If carpureter loads up after considerable service, float level should be checked Wear on lip of float lever will raise float level Float level may be reset by bending lip of float lever down to raise float level or bending lever up to lower float level Only a very slight bend is needed

If motor stalls while idling, reset idle adjustment screw and throttle lever adjusting screw If these adjustments do not correct the trouble, remove low speed jet tube and clean thoroughly with compressed air Examine and see that tube seats gasoline-tight in body casting, top and bottom If not, replace with a new tube of identical specifications NEVER CHANGE A LOW SPEED JET TUBE FROM ONE CARBURETER TO ANOTHER

Increased resistance on foot throttle indicates a clogged pump jet Pump jet should be removed and cleaned with compressed air, which, in many cases will remove the dirt or lint However, it is usually advisable to replace the pump jet, as its cost is nominal All jets and ball checks must be seated gasoline-tight

Poor acceleration may be due to damaged or worn plunger leather in accelerating pump corrosion in pump cylinder, loose or cracked cylinder, cracked plunger cup or bent pump arm (parts which may be replaced at small cost) When plunger is removed from cylinder, always use loading tool in reassembling to avoid damage to plunger leather

W-1 DOWN-DRAFT CARBURETERS **Nos. 483S-492S-515S-570S-574S**

CARBURETER SPECIFICATIONS

For Chevrolet Six Cylinder Engine: 3½ Inch Bore, 3¾ Inch Stroke (483S-492S-574S)
For Chevrolet Six Cylinder Engine: 3-9/16 Inch Bore, 3-15/16 Inch Stroke (515S-570S)

Dimensions: (All) Flange size, 1¼ inch S. A. E.
(All) Primary venturi, 11/32 inch I. D.
(All) Secondary venturi, 11/16 inch I. D.
(483S-515S-570S-574S) Main venturi, 1¼ inch I. D.
(492S) Main venturi 1-1/16 inch I. D.

Float Level: (483S-492S-574S) Distance from float (at free end) to float chamber cover, when needle is seated, to be ½ inch plus or minus 1/64 inch; (515S-570S) ⅜ inch.

Vents: (All) Outside, none. Inside balance vent tube above choke valve 13/64 inch I. D.

Gasoline Intake: (All) Square vertical needle. Size No. 48 drill hole in needle seat.

Low Speed Jet Tube: (483S-515S-570S-574S) Vertical jet size, .035 inch diameter.
(492S) Jet size, No. 72 drill.
(483S-515S-570S-574S) By-pass in body, size No. 51 drill.
(492S) By-pass in body, size No. 56 drill.
(All) Economizer jet; size .0545 to .0555 inch diameter.

Idle Ports: (All) Upper port diameter, No. 44 drill.
(483S-515S-570S-574S) Lower port diameter, No. 54 drill.
(492S) Lower port diameter, No. 52 drill (early production); No. 54 drill (late production).

Idle Port Opening: (483S-492S-515S-574S) Top of lower port .044 to .048 inch above top edge of valve, with valve closed tight.
(570S) Top of lower port .016 to .020 inch above top edge of valve with valve closed tight.

Idle Screw Seat: (All) Size No. 52 drill.

Set Idle Adjustment Screw: (All) 1¼ to 2¼ turns open. For richer mixture, turn screw out. Do not attempt to idle engine below 350 r. p. m.

Outer Nozzle: (All) In primary venturi, angle 30°. Discharge size, .125 inch diameter.

Inner Nozzle: (All) (Seats in outer nozzle) .120 inch I. D.

Nozzle Retainer Plug: (483S-515S-570S-574S) Jet size No. 31 drill (early production), No. 29 drill (late production).
(492S) Jet size, No. 53 drill.

Metering Rod: **(483S-574S—CIVILIAN VEHICLES)** Economy step .067 inch diameter. Second step tapers to .062 inch diameter. Third step tapers to .060 inch diameter. Power step .046 inch diameter. Length 3⅜ inches.
(483S-515S-570S-574S—MILITARY VEHICLES) Economy step 066 inch diameter. Second step tapers to .058 inch diameter. Power step .042 inch diameter. Length 3⅜ inches.
(492S) Economy step .0645 inch diameter. Second step .063 inch diameter. Third step tapers to .061 inch diameter. Power step .046 inch diameter. Length 3⅜ inches.

Metering Rod Jet: (483S-515S-570S-574S) Size .093 inch diameter. (492S) Size .0835 inch diameter.

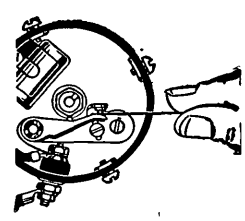
Metering Rod Setting: (All) Use gauge, part No. T109-25 (2.795 inches).

Accelerating Pump: (All) Low pressure type with non-adjustable stroke.
(All) Discharge jet, size No. 72 drill.
(All) Intake disk check plug, size No. 62 drill.
(All) Discharge disk check plug, size No. 40 drill.

Choke: Butterfly type, offset valve.

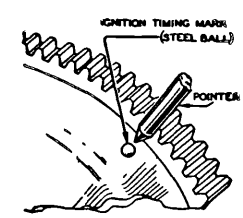
Throttle Valve: Opens to within 0° to 3° from perpendicular (483S-515S-570S-574S).

Throttle Lever: Restricts maximum speed to approximately 60 m.p.h. (492S).



Vacuum Spark Port: (483S-492S-515S-574S) Slot type: size, .041 to .125. Bottom of port .000 to .004 above top of valve. (570S) None.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, float level should be checked. Wear on lip of float lever will raise float level. Float level may be reset by bending lip of float lever down to raise float level or bending lever up to lower float level. Only a very slight bend is needed.

If motor stalls while idling, reset idle adjustment screw and throttle lever adjusting screw. If these adjustments do not correct the trouble, remove low speed jet tube and clean thoroughly with compressed air. Examine and see that tube seats gasoline-tight in body casting, top and bottom. If not, replace with a new tube of identical specifications. NEVER CHANGE A LOW SPEED JET TUBE FROM ONE CARBURETER TO ANOTHER.

Increased resistance on foot throttle indicates a clogged pump jet. Pump jet should be removed and cleaned with compressed air, which, in many cases, will remove the dirt or lint. However, it is usually advisable to replace the pump jet, as its cost is nominal. All jets and ball checks must be seated gasoline-tight.

Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, corrosion in pump cylinder, loose or cracked cylinder, cracked plunger cup or bent pump arm (parts which may be replaced at small cost). If plunger is removed from cylinder, always use loading tool in reassembling to avoid damage to plunger leather.

†Note: The use of flat or conical plug washers should be determined by shape of seat in casting.

NOTE: Figures in parentheses indicate number of pieces used in one carbureter. Where no figure shown, only one is used.

Model M-80
Two Carbureters
Per Engine

CHRYSLER MARINE 1959

YH Horizontal **Carbureter No. 2911S**

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder 318 Cu. In. Engine: Vacuum at Idle 19.5 Inches

Dimensions: Flange size 1¼ inch 3 bolt Primary venturi 11/32 inch I D Secondary venturi 11/16 inch I D Main venturi 1 5/16 inch I D

Vents: Outside none Inside balance vent tube to air horn ahead of choke valve

Low Speed Circuit: Jet size No 69 (.029 inch) drill By pass in body size No 56 (.0465 inch) drill Economizer size No 60 (.040 inch) drill Idle port slot type length .162 inch width .030 inch

Idle Port Opening: Top of port .124 to .128 inch above top edge of valve with valve tightly closed Lower port size .0615 to .0655 inch diameter (for idle adjusting screw)

Set Idle Adjustment Screw: ¼ to 1¾ turns open For richer mixture turn screw out Do not idle engine below 500 r p m

Main Nozzle: In primary venturi DO NOT REMOVE Anti percolating jet (in tube) to nozzle size No 70 (.028 inch) drill

Accelerating Pump: Diaphragm type vacuum and mechanically operated Discharge (pump) jet size No 70 (.028 inch) drill Intake ball check (in diaphragm housing) seat size 115 120 inch diameter Discharge needle check (in body) seat size .092 inch diameter Vacuum passage restriction (in body) size No 46 (.081 inch) drill Vacuum bleed (to throttle bore) size No 65 (.035 inch) drill

Choke: Manual, offset butterfly type with poppet valve

Vacuum Spark Port: None

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open: 10° B. T. C. At Vibration Damper	Valve Setting (Hot) Intake .010" Exhaust .018"	Float Setting 9/16 Inch (Use gauge T109-84)	Idle Adjustment Screw Setting ¼ to 1¾ Turns Open Idle Engine at 500 R.P.M. in Neutral

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: With gasket removed, bowl cover assembly inverted and float resting on pin in seated needle, the distance from the bowl cover to the top of float should be 9/16 inch (gauge T109-84). Do not depress float lip against spring loaded pin in needle, but let float rest of its own weight Adjust by bending float lever Float setting must be checked with bowl cover held at eye height in a level position

FLOAT DROP: With bowl cover assembly held in upright position, the distance between bottom of float (at free end) and bowl cover should be 2⅜" Adjust by bending stop tab on float arm

METERING ROD ADJUSTMENT: This adjustment is important and should be checked each time the carbureter is reassembled Insert gauge (T109-104) in place of metering rod, seating tapered end of gauge in metering rod jet Hold gauge vertical to insure seating in jet With throttle valve tightly closed, press down on diaphragm shaft until metering rod arm contacts lifter link at diaphragm stem With diaphragm shaft held in this position, metering rod pin must

AFB Four-Bore Down-Draft Climatic® Control Carbureters Nos. 2798S 2799S

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder (MCIX-3) 383; (MC3-S, C-300E) 413 Cu. In. Engine: Vacuum at Idle 19.5 Inches

Dimensions: Flange, four bore – 4 bolt type.
Throttle Bore, primary 1-7/16 inch.
Secondary 1-9/16 inch I.D.
Primary venturi size, primary side, 7/16 inch, secondary side, 11/32 inch I.D.
Main venturi size, primary side 1-1/16 inch, secondary side, 1-1/4 inch I.D.

Vents: Inside (4) in air horn. Outside (5) in air horn.

Low Speed Circuit: (Primary Side Only)
Jet, size No. 68 (.031 inch) drill.
By-pass, size (.0492 inch) diameter.
Economizer, size No. 57 (.043 inch) drill.
Idle Bleed, size No. 55 (.052 inch) drill.
Idle port, slot type, length .166 inch; width .030 inch.

Idle Port Opening: (2798S) .094 to .100 inch; (2799S) .085 to .091 inch above top edge of valve with valve tightly closed.

Set Idle Adjustment Screw: 1/2 to 2 turns open. For richer mixture turn screw out. Do not idle engine below 650 R.P.M. Transmission in neutral.

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolator bleed, primary, (tube in venturi assembly) size No. 68 (.031 inch) drill.
Secondary, drilled hole in venturi assembly siz No. 60 (.040 inch) drill.

Main Vent Tube: (In venturi assembly, primary side only). Side holes 11 – size No. 70 (.028 inch) drill, 1 – size No. 65 (.035 inch) drill.

Secondary Initial Discharge: (In venturi assembly). Pick up tube size No. 60 (.040 inch) drill. Air bleed size (.0275 inch) diameter. Discharge port size No. 53 (.0595 inch) drill.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 68 (.031 inch) drill. Intake ball check seat (screw plug), size .115 to .120 inch diameter. Discharge needle seat size No. 50 (.070 inch) drill.

Choke: (2799S) Carter Climatic® Control set 1 point rich. Butterfly type – offset choke valve, primary side only. Choke heat suction hole, bushing betw en body and piston housing, size No. 48 (.076 inch) drill.

Vacuum Spark Port: (2799S) Round type .060 inch diameter. Top of port .012 to .018 inch above upper edge of valve with valve tightly closed.

Motor Tune-Up – Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open: 10° B. T. C. At Vibration Damper	Float Setting	Idle Adjustment Screw Setting
.035"	.017"		(2798S) 9/32" (Use Gauge T109-126) (2799S) 7/32" (Use Gauge T109-106)	½ to 2 Turns Open 650 R. P. M. In Neutral

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: (2798S) 9/32 inch (gauge T109-126). (2799S) 7/32 inch (gauge T109-106) between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float bracket.

PUMP: 7/16 inch from the top of the bowl cover to the top of the plunger shaft with throttle conn ctor rod in center hole (medium stroke) of pump arm. To adjust, bend throttle connector rod.

CHOKE PISTON LEVER ADJUSTMENT: (2799S only) 1/8 inch (gauge T109-36) between choke lever and stop in piston housing with choke valve closed. To adjust, bend choke connector rod.

FAST IDLE LINKAGE ADJUSTMENT: (2799S only). With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: (2799S only) .012 inch (gauge T109-200) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: (2799S only) 1400 R.P.M. hot engine with fast idle screw on index mark of cam.

UNLOADER: (2799S only) 1/4 inch (gauge T109-31) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 23/64 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: At wide open throttle primary and secondary valves will reach full vertical position. 3. With primary and secondary valves in tightly closed position there should be .010" to .030" (gauge T109-29) between positive closing shoes on primary and secondary throttle lever. To adjust, bend shoe on secondary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: (2799S only). 1. Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever. 2. With lock-out dog held tight against stop on flange casting and secondary throttle valves partially open there should be .020 inch (gauge T109-29) between tang on secondary throttle lever and lock-out arm. To adjust, bend arm at slot on lock-out dog. NOTE: Fast idle cam may be removed to facilitate gauging and adjusting.

IDLE SPEED AND MIXTURE ADJUSTMENT (Normal Engine Temp): In making the idle adjustment on the engine, the air adjustment screw is used to adjust idle speed in a similar manner as the throttle speed screw used previously. Turning the air adjustment screw outward increases engine speeds, but also leans the mixture supplied to the manifold which must be compensated for by adjustment of the idle mixture adjusting screws.

TOOLS REQUIRED FOR SERVICING CARBURETERS:

–Parts so marked are new and listed for the first time.

NOTE: Figures in parentheses indicate number of pieces used in one carbureter. Where no figure is shown, only one is used.

CARTER MODEL AFB CARBURETER FOR CHRYSLER (SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the base of the carbureter, when requesting specification pages.

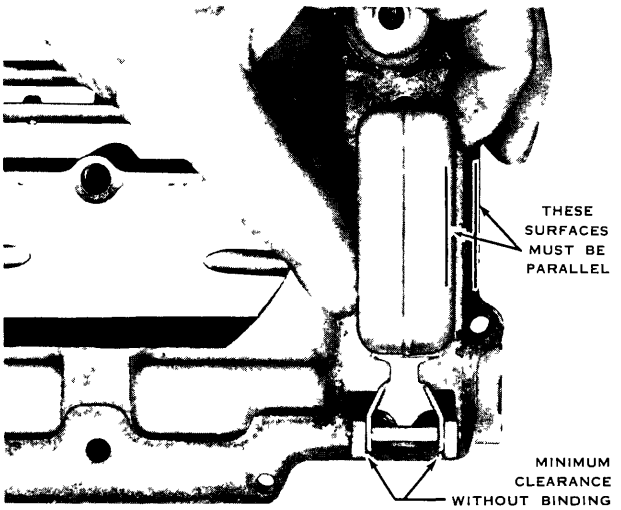

Figure 1

FLOAT ALIGNMENT ADJUSTMENT (Fig. 1):

1. Sight down the side of the float shell to determine if the side of the float is parallel to the outer edge of the air horn casting. TO ADJUST: Bend float lever by applying pressure to the end of the float shell with the fingers while supporting the float lever with the thumb.

   CAUTION: To avoid damaging the float, apply only enough pressure to bend float lever.

2. After aligning float, remove as much clearance as possible between arms of float lever and lugs on air horn by bending the float lever. Arms of float lever should be as parallel to the inner surfaces of lugs on air horn as possible.

   Floats must operate freely without excess clearance on its hinge pin.

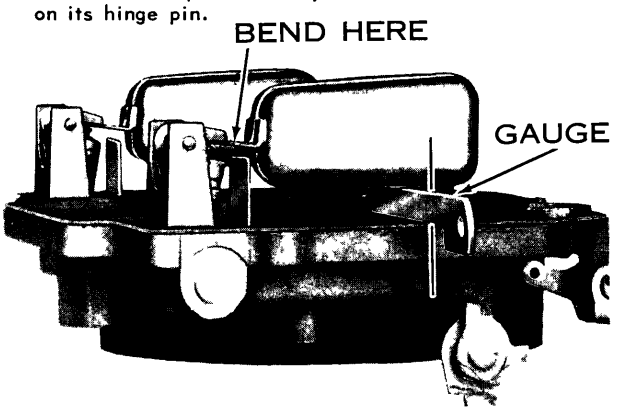

Figure 2

FLOAT LEVEL ADJUSTMENT (Fig. 2):

With air horn inverted, bowl cover gasket in place and needle seated, th clearance betwe n top f float (at outer end) and air horn gasket should be as listed on carbur ter specification page. To adjust, b nd float arm. Adjust both floats. Recheck float alignm nt.

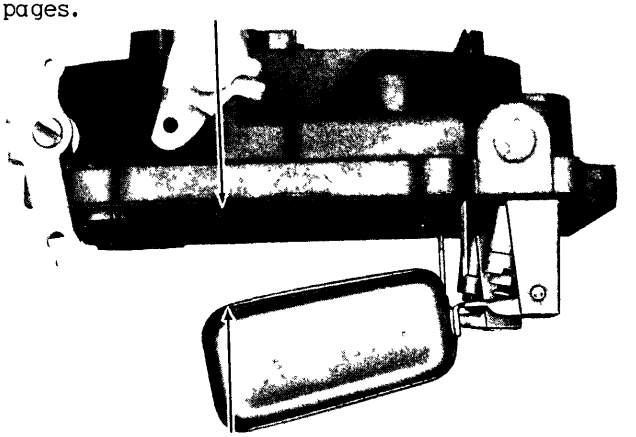

Figure 3

FLOAT DROP ADJUSTMENT (Fig. 3):

With bowl cover held in upright position and measuring from outer end of each float, the distance between top of floats and bowl cover gasket should b as listed on carbureter specification page. To adjust, b nd stop tabs on float brackets.

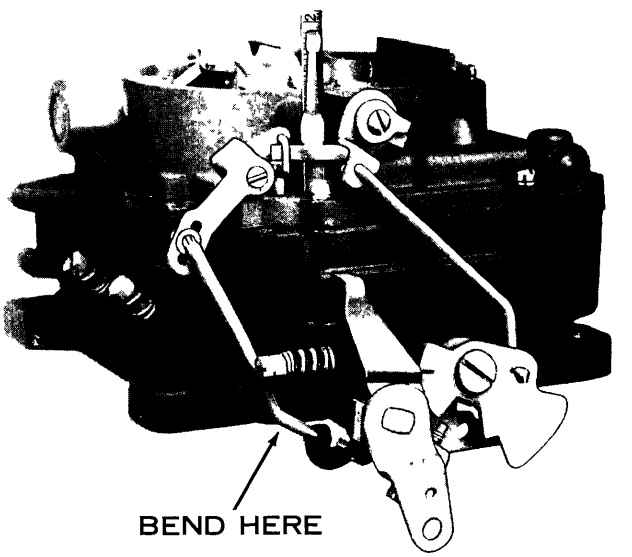

Figure 4

PUMP ADJUSTMENT (Fig. 4):

1. Back out idle speed screw until throttle valves seat in bores of carbureter. NOTE: Be sure fast idle adjusting screw does not contact fast idle cam and hold throttle valves open.
2. With throttle connector rod in cent r hole (medium stroke) of pump arm, the distanc fr m the top of the bowl cover to the top of the plunger shaft should b as list d on carbureter specification page.
3. Adjust by bending throttle connector rod at lower angle (use t ol T109-213).

All Rights Reserved

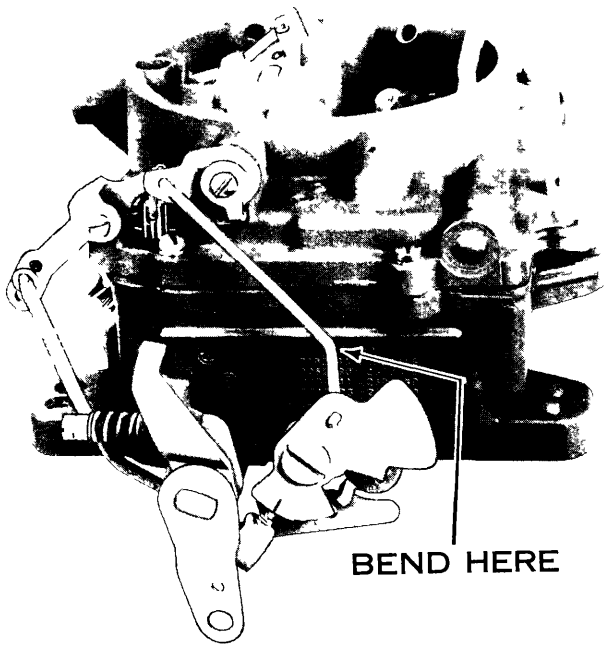

Figure 5

FAST IDLE LINKAGE ADJUSTMENT (Fig. 5):

With ch ke valv tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod. (Use tool T109-213.)

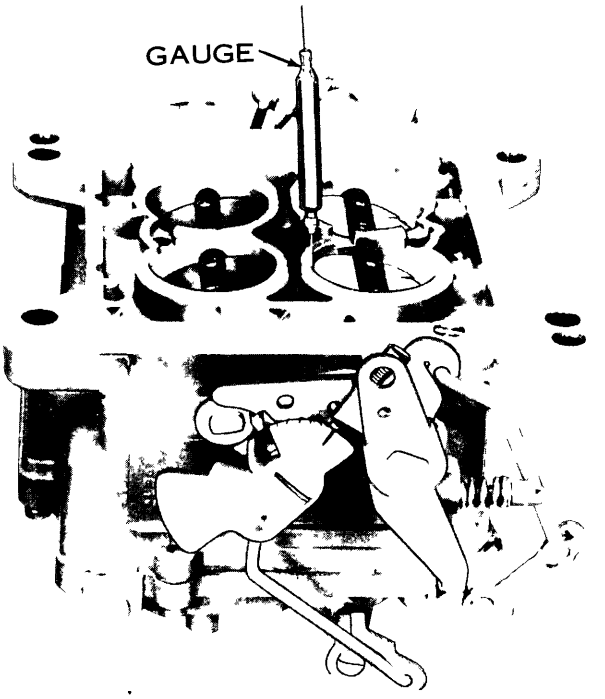

Figure 6

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 6):

With choke valve tightly closed, tighten fast idle adjusting screw (on index mark of cam) until the clearance between throttle valve and bore of carbureter, side opposite idle port, is as listed on carbureter specification page.

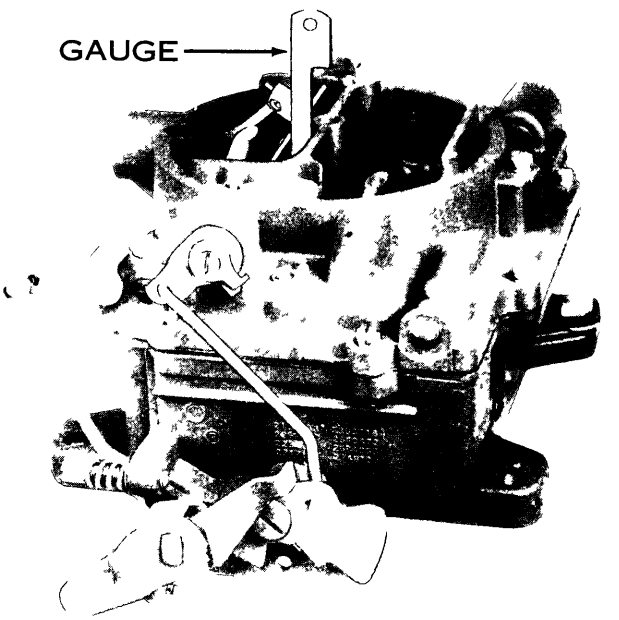

Figure 7

UNLOADER ADJUSTMENT (Fig. 7):

With throttle wid open, th cl arance betw n upper edge of choke valve and inner wall of air horn should be as listed on carbureter specification page. To adjust, bend unloader lip on throttle shaft lever. (Use tool T109-41.)

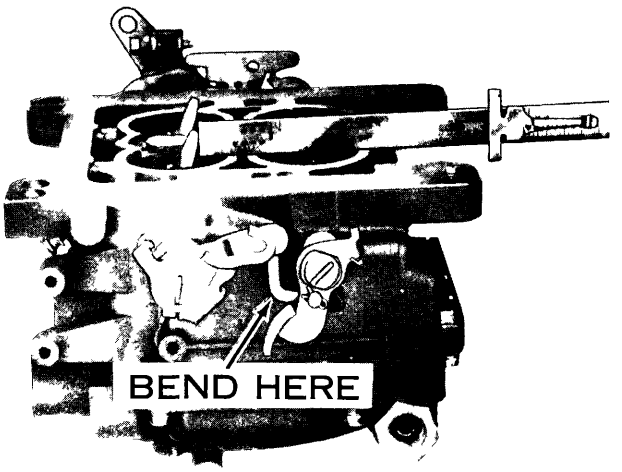

Figure 8A

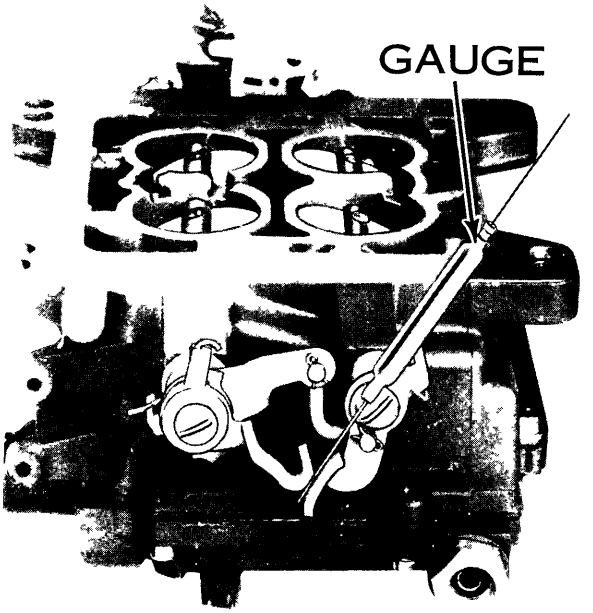

Figure 8B

SECONDARY THROTTLE LEVER ADJUSTMENT (Figs. 8A & 8B):

1. Block choke valve wide open.
2. Secondary throttle valves should just start to open when primary throttle valves are opened to the clearance as listed on specification page between lower edge of valve and bore (opposite idle port). To adjust, bend throttle operating rod. (Use bending tool T109-213). (See Fig. 8A) NOTE: Primary and secondary throttle valves should reach wide open position, full vertical, at the same time.
3. With primary and secondary throttle valves in tightly closed position, there should be the clearance as listed on specification page between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever. (See Fig. 8B)

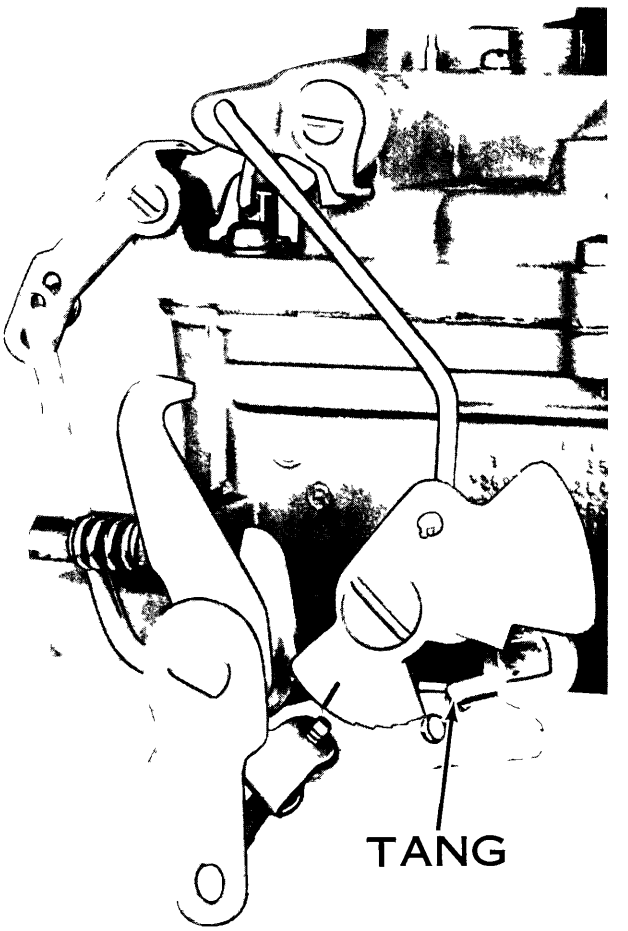

Figure 9

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 9):

Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. If necessary to adjust, bend tang on secondary throttle lever.

NOTE: See last page for pertinent service information.

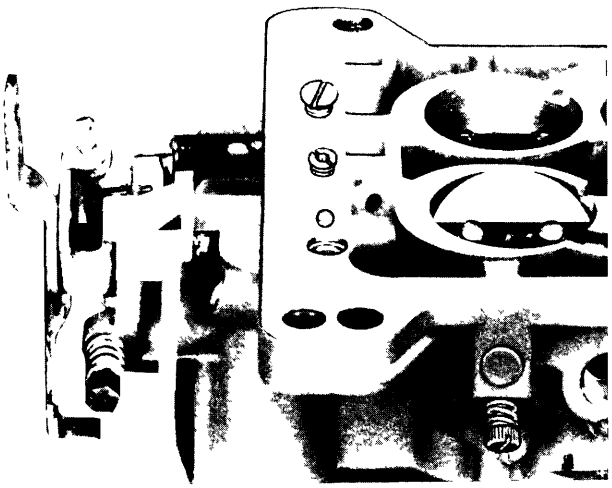

Figure 10

(Fig. 10):

Pump intake check ball, seat and screw plug are removed by inverting carbureter and removing from lower side of flange.

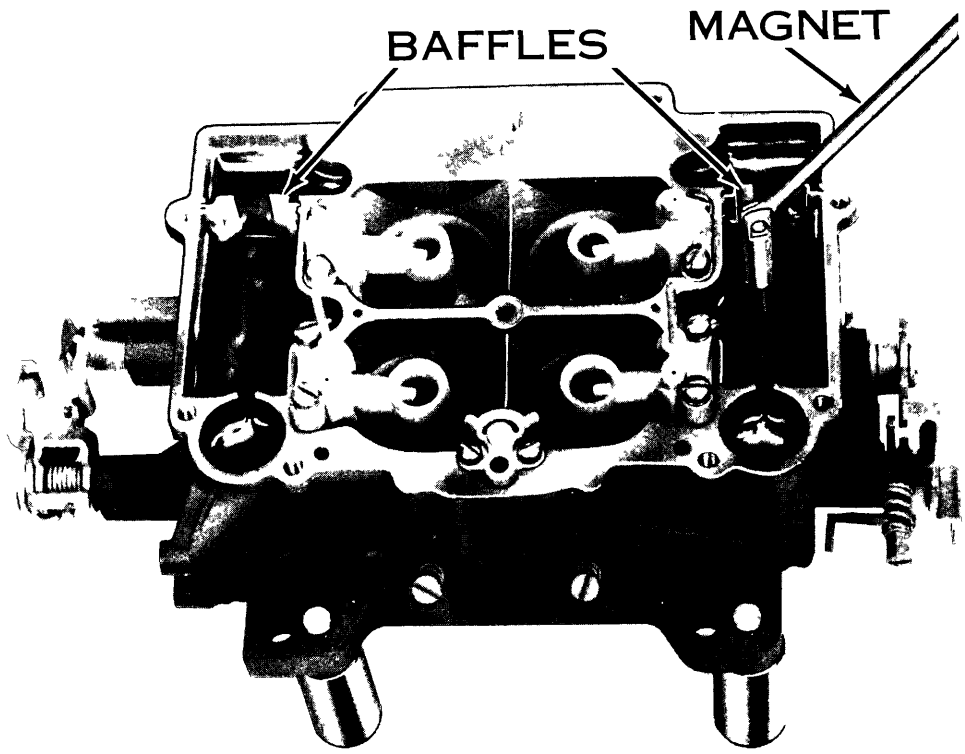

Figure 11

(Fig. 11):

Flooding, stumble on acceleration and other performance complaints are, in many instances, caused by the presence of dirt, water or other foreign matter in the carbureter. To aid in diagnosing the cause of the complaint, the carbureter should be carefully removed from the engine without draining the fuel from the bowl. The contents of the fuel bowl may then be examined for contamination as the carbureter is disassembled.

Check the fuel in the bowl for contamination by dirt, water, gum or other foreign matter. A magnet moved through the fuel in the bowl will pick up and identify any iron oxide dust that may have caused intake needle and seat leakage.

Inspect gasketed surfaces between body and air horn. Small nicks or burrs should be smoothed down to eliminate air or fuel leakage. Be especially particular when inspecting the top surface of the inner wall of the bowl around the vacuum piston passage. A poor seal at this location may contribute to a "cutting-out" on turns complaint.

Install fuel baffles as shown (Fig. 11) to prevent damage to floats. Use caution when installing air horn assembly. Baffles on air horn assembly must fit inside of fuel bowl baffles toward primary side of carbureter.

Fill the carbureter bowl with clean fuel before installing on the manifold. This will help prevent dirt trapped in the fuel system from being dislodged by the free flow of fuel as the carbureter is primed. The operation of the floats and intake needle and seats may be checked under pressure if a fuel pump is used at the bench to fill the carbureter bowl. Operate the throttle several times and visually check the discharge from the pump jets.

Before installing the carburetor, hold choke valve open and turn the idle speed screw until it just contacts the throttle lever, then 1/2 a turn more to open the throttle valves enough to keep the engine running until the idle mixture and final R.P.M. adjustment can be made.

CARTER CARBURETOR
DIVISION OF acf INDUSTRIES INCORPORATED
ST. LOUIS, MO., U. S. A.

CARTER MODEL BBD CARBURETER FOR CHRYSLER
(SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the brass identification tag, when requesting specification pages.

Figure 1

FLOAT ADJUSTMENT (Fig. 1):

This adjustment must be made with th bowl cov r gasket removed. Hold the lip on float arm against the seated intake needle, making sure th float pin is at the bottom of its guide slots. The distance (A) from the top surface of the body casting to the top of ach float (at free end) should be as listed on carbur t r specification page. If one float is low r than the other, equalize by bending the float arm. If both floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywhere against the inner walls of the bowl. If nec ssary, bend float arms slightly to provide clearanc on all sid s of floats.

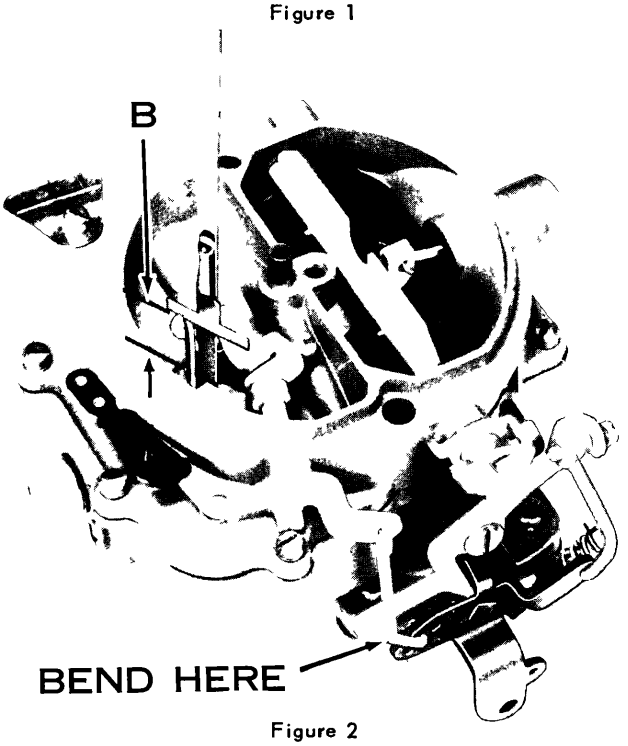

Figure 2

PUMP ADJUSTMENT (Fig. 2):

1. Back out throttle adjustment screw and open choke valve so that throttle valves seat in bores of carbureter.
2. Install throttle connector rod in the hole in the throttle lever specified on carbureter specification page.
3. The distance (B) from the top of the bowl c ver to the top of the plunger shaft should be as specifi d on carbureter sp cificati n pag .
4. Adjust by bending pump connector rod. (Use bending tool T109-213)

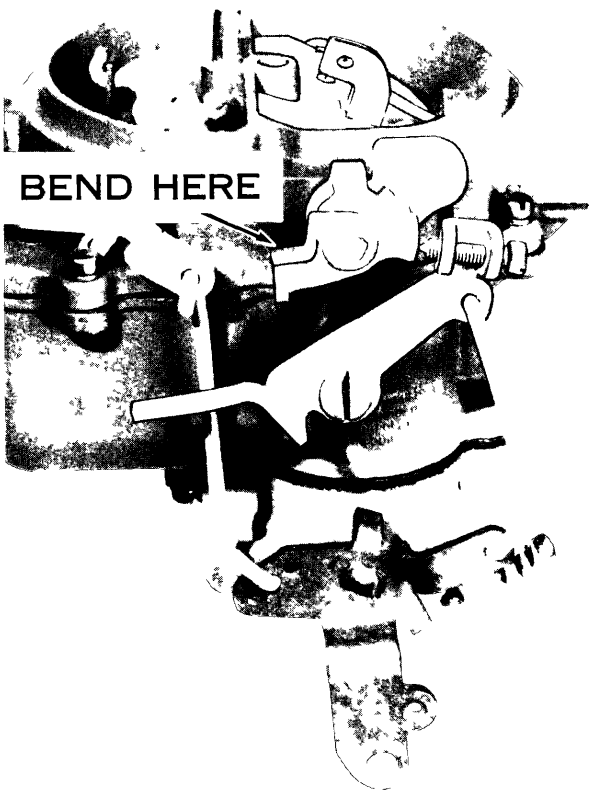

Figure 3

FAST IDLE LINKAGE ADJUSTMENT (Fig. 3):

With choke valve tightly closed and lug on fast idl cam contacting lip on choke shaft lever align c nter of fast idle screw with index mark on cam. To adjust bend lip on choke shaft lever (use t ol T109-22).

TRADE MARK RE . U. S. PAT. OFF.
MARCA REGISTRADA

S S PRINTED IN U.S.A.

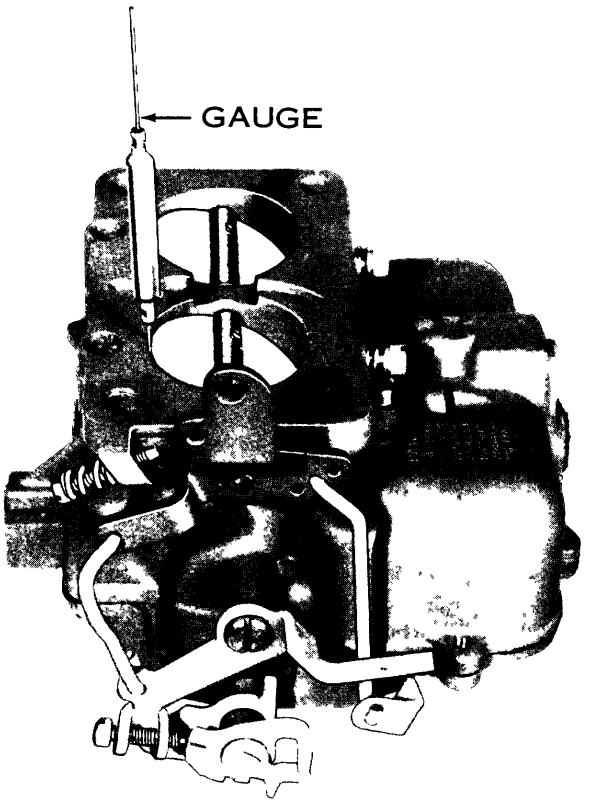

Figure 4

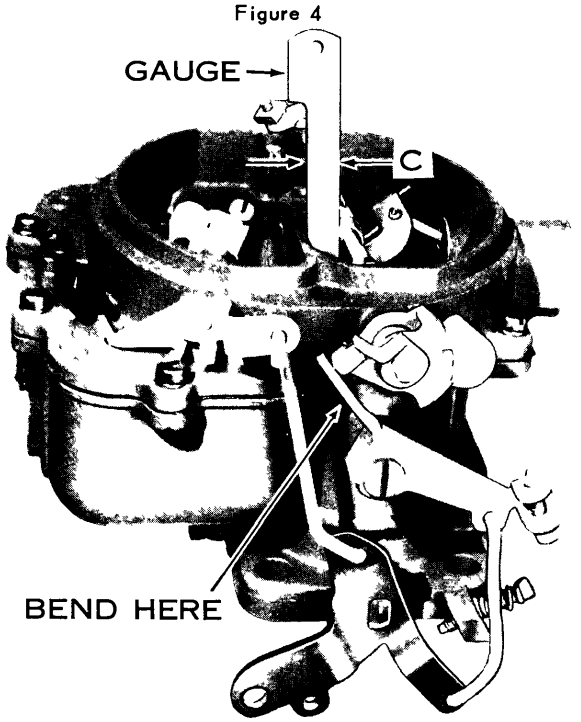

Figure 5

UNLOADER ADJUSTMENT (Fig. 5):

1. Hold throttle valves wide open.
2. Clos choke valve as far as possible without f rcing.
3. Clearance (C) between top dge of choke valve and inner wall of air horn should be as listed on carbureter specification page.
4. Adjust by bending unloader finger on fast idle arm. (Use tool T109-22).

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 4):

1. Be sure choke valve is closed.
2. Adjust fast idle adjusting screw against index mark of cam (revolve cam if necessary) until the clearance between throttle valve (side opposite port) and bore is as listed on carbureter specification page.

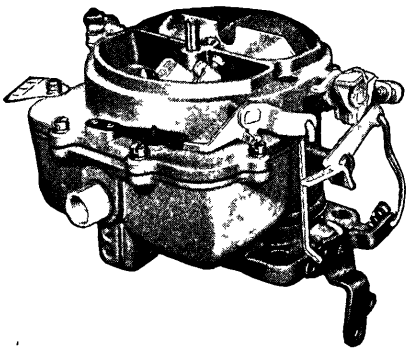

Figure 6

BOWL VAPOR VENT ADJUSTMENT (Fig. 6):

With throttle valve tightly closed the clearance between the heel of the rubber grommet and its seat on the bowl cover should be as listed on carbureter specification page. To adjust, bend lip on vapor vent arm (Use tool T109-22)

CAUTION:

When servicing carbureter use elevating legs (T109-289U) to prevent damaging throttle valves.

CHRYSLER
MODEL MC1
1959

BBD Dual Down-Draft Climatic® Control Carbureters Nos. 2795S-2872S

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder 383 Cu. In. Engine: Vacuum at Idle 19.5 Inches

Dimensions: Flange dual, 4 bolt type. Throttle bore, 1-9/16 inch I. D. Primary venturi, 15/32 inch I. D. Main venturi 1-5/16 inch I. D.

Vent: Inside, in air horn. Outside, none.

Low Speed Circuit: Jet, in venturi assembly, size (.0295 inch) diameter. Idle bleed, in venturi cluster screw, size (.055 inch) diameter. Idle restriction, in venturi cluster screw, size (.051 inch) diameter. Venturi idle bleed, in body, size (.040 inch) diameter. Idle port, slot type, length .198 inch; width .030 inch.

Idle Port Opening: .140 to .144 inch above upper edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size .055 inch diameter.

Set Idle Adjustment Screw: 3/4 to 2 1/4 turns open. For richer mixture, turn screw out. With gear shift in neutral position, idle engine at 500 R. P. M.

Main Nozzle: Nozzle is installed permanently. DO NOT REMOVE.

Main Vent Tube: Side holes 2—size .0292 inch, 1—size .038 inch diameter.

Accelerating Pump: Pump discharge jets (2—in venturi cluster), size .0275 inch diameter. Intake ball check seat, size .130 to .140 inch diameter. Discharge ball check seat, size .110 to .120 inch diameter.

Choke: Carter Climatic® cross over type, set at index. Butterfly type, offset valve. Choke heat suction hole, in air horn, size (.0905 inch) diameter.

Vacuum Spark Port: Horizontal, round end type, .030 by .090 inch. Top of port to be .015 to .025 inch, above upper edge of valve with valve closed tight.

Motor Tune-Up — Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open: 10° B. T. C. At Vibration Damper	Float Setting 5/16 Inch (Use Gauge T109-280)	Idle Adjustment Screw Setting 3/4 to 2 1/4 Turns Open Idle Engine at 500 R. P. M. In Neutral

NOTE: These cars are equipped with Hydraulic Valve Lifters — NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3765

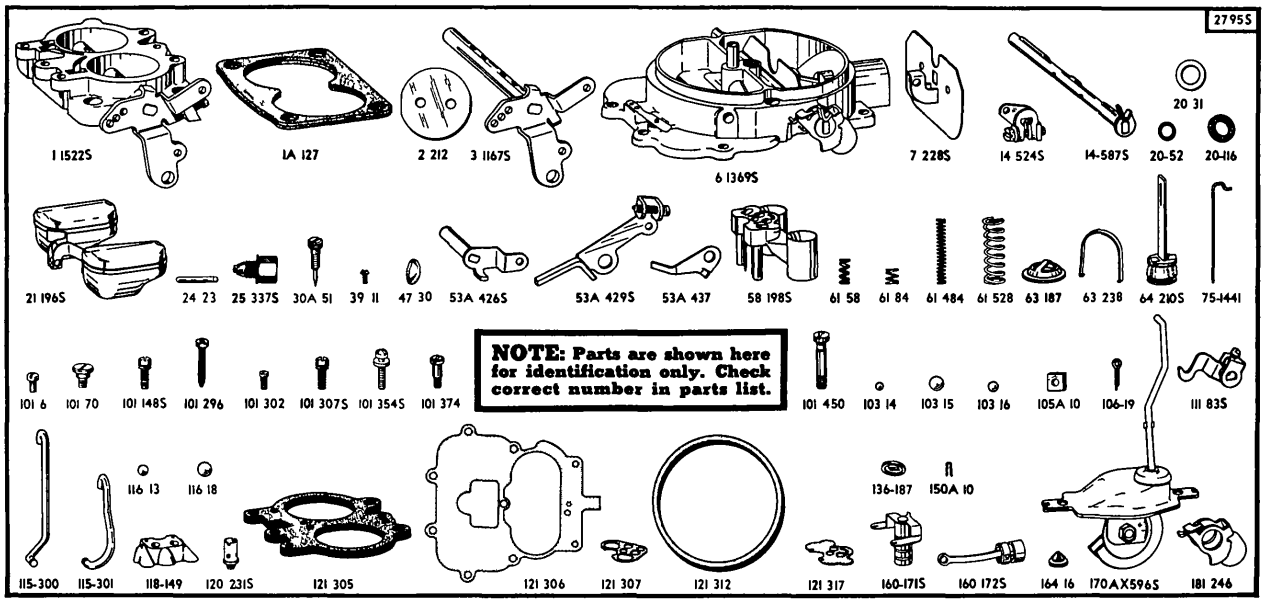
Float Level: 5/16 inch (gauge T109-280) between top of each float ridge (at free end of float) and top surface of body casting. To adjust, bend lip on float arm.

Pump: 1 inch from top of the bowl cover to the top of the plunger shaft. Install throttle connector rod in center hole (medium stroke) of throttle lever. To adjust, bend throttle connector rod. When throttle connector rod is installed in a different hole for seasonal operation the bowl vapor vent must be readjusted.

Fast Idle Linkage Adjustment: With choke valve tightly closed and lug on fast idle cam contacting lip on choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend lip on choke shaft lever.

Fast Idle Throttle Valve Clearance: .018 inch (gauge T109-44) between lower edge of valve and bore with adjusting screw on index mark of cam.

Fast Idle on Car: 1400 R. P. M. hot engine, with fast idle screw on index mark of cam.



Unloader: 15/64 inch (gauge T109-32) between top edge of choke valve and inner wall of air horn with throttle valve wide open. To adjust, bend unloader finger on fast idle arm.

Bowl Vapor Vent Adjustment: .062" to .093" (gauge T109-234) between the heel of the rubber grommet and its seat on the

AFB Four-Bore Down-Draft Climatic® Control Carbureter No. 2797S

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder 383 (MC2); 413 (MC3-H), (MY1) Cu. In. Engine: Vacuum at Idle 19.5 Inches

Dimensions: Flange, four bore—4 bolt type.
Throttle bore, primary, 1-7/16 inch; secondary 1-9/16 inch.
Primary venturi size, primary side, 7/16 inch, secondary side, 11/32 inch I. D.
Main venturi, primary, 1-3/16 inch; secondary, 1-5/16 inch.

Vents: Inside (4) in air horn: Oustide (5) in air horn.

Low Speed Circuit: (Primary side only)
Jet, size No. 66 (.033 inch) drill.
By-pass, size (.0492 inch) diameter.
Economizer, size (.0452 inch) diameter.
Idle bleed, size (.0492 inch) diameter.
Idle port, slot type, length .198 inch, width .030 inch.

Idle Port Opening: .167 to .173 inch above top edge of valve with valve tightly closed.

Set Idle Adjustment Screw: ½ to 2 turns open. For richer mixture turn screw out. Do not idle engine below 500 R. P. M. Transmission in neutral.

Main Nozzle: Install permanently. DO NOT REMOVE. Antipercolator bleed, primary (tube in venturi assembly), size No. 68 (.031 inch) drill. Secondary (drilled hole in venturi assembly) size No. 60 (.040 inch) drill.

Main Vent Tube: (In venturi assembly) Side holes primary side 11—size No. 70 (.028 inch) 1—size No. 65 (.035 inch) drill; secondary side 2—size No. 57 (.043 inch) 1—size No. 70 (.028 inch) drill.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 68 (.031inch) drill. Intake ball check seat (screw plug) size .115 to .120 inch diameter. Discharge needle seat size No. 50 (.070 inch) drill.

Choke: Carter Climatic® Control Cross Over type, set on index. Butterfly type offset valve, primary side only. Choke heat suction hole, in air horn, size No. 44 (.086 inch) drill.

Vacuum Spark Port: Slot type (round end) .045 x .110 inch. Top of port .026 to .034 inch above top edge of valve with valve tightly closed.

Motor Tune-Up — Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open:	Float Setting	Idle Adjustment Screw Setting
.035"	.017"	10° B. T. C. At Vibration Damper	(See Adjustments)	½ to 2 Turns Open Idle Engine at 500 R. P. M. In Neutral

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3767

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 7/32 inch (gauge T109-106) plus or minus 1/64 inch, between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch plus or minus 1/16 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 7/16 inch from the top of the bowl cover to the top of the plunger shaft with throttle connector rod in center hole (medium stroke) of pump arm. To adjust, bend throttle connector rod.

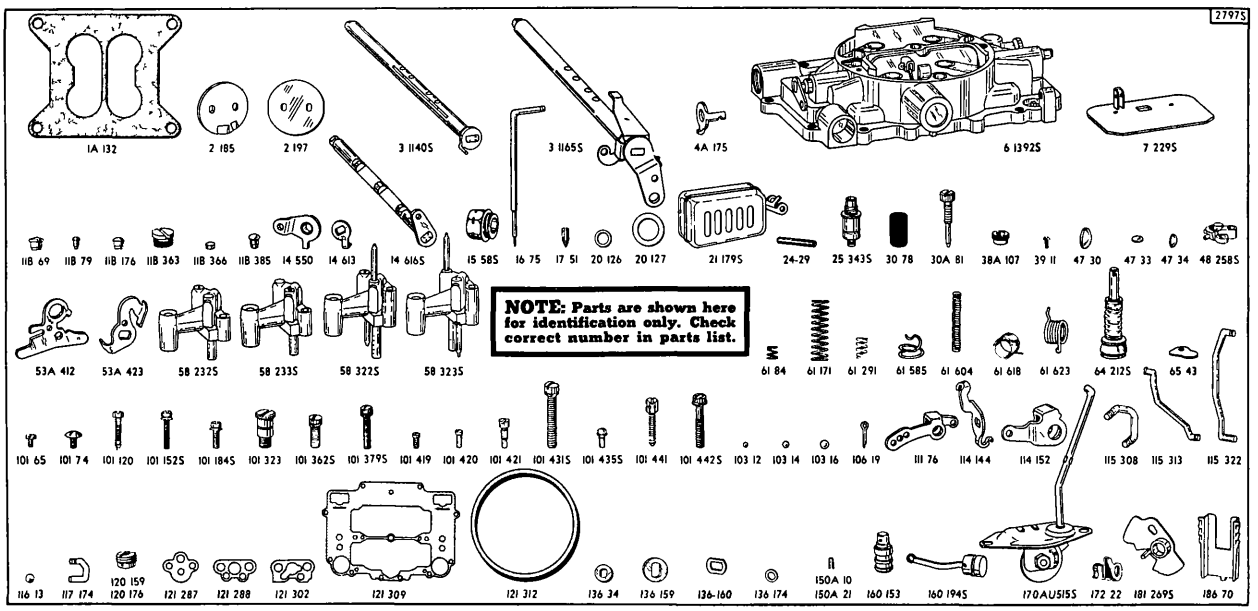
FAST IDLE LINKAGE ADJUSTMENT: With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .015 inch (gauge T109-44) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 1400 R. P. M. hot engine with fast idle screw on index mark of cam.

UNLOADER: 1/4 inch (gauge T109-31) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 3/8 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: At wide open throttle primary and secondary valves will reach full vertical position. 3. With primary and secondary throttle valves in tightly closed position there should be .010" to .030" (gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.



SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.

CHOKE ADJUSTMENT (CROSS OVER TYPE) SEE FORM 3657 FILED UNDER PLYMOUTH: 1. Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page. Hold in this position with screw driver and tighten lock nut. NOTE: Screw driver may be held in vise so that one hand may be used to support housing while tightening nut. 2. After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover. If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without affecting calibration.

GENERAL BULLETIN

CARBURETER CONTRACT ACCOUNTS
FACTORY, P.I. AND P.C.T. GRADUATES

BULLETIN NO. 57 Chrysler

DATE March 26, 1958

SUBJECT: 1958 CHRYSLER AND IMPERIAL STALLING AND STUMBLE COMPLAINTS

STALLING AND STUMBLE ON ACCELERATION DURING ENGINE WARM-UP AFB-2650S, 2651S, 2805S AND 2806S (4 BORE) CARBURETERS

Complaints have been received of the engine stalling after the initial start and upon the first few accelerations during the warm-up period. This difficulty has been traced to the choke valve being pulled open too far by the choke piston.

The following adjustment corrects this condition by reducing the amount of opening of the choke valve caused by the pull of vacuum on the piston during the warm-up period. This adjustment replaces the choke piston lever adjustment shown on the carbureter catalog specification page.

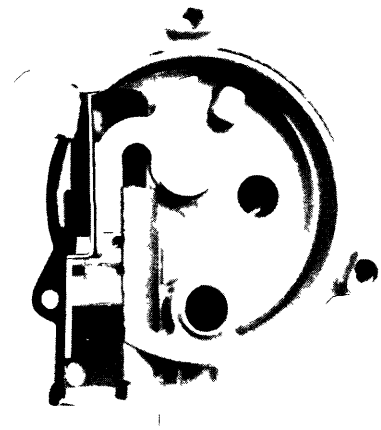

Figure 1.

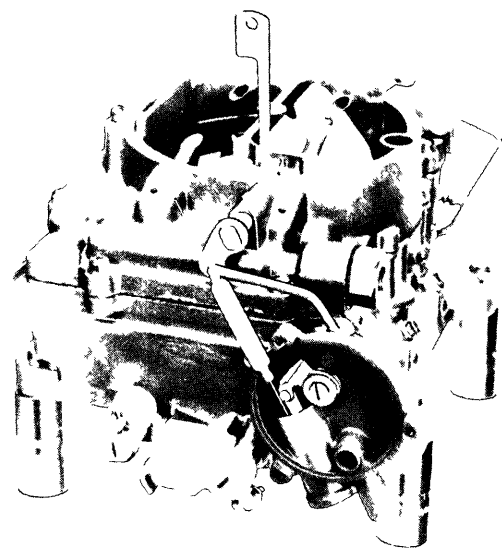

Figure 2.

1. Bend a .026" wire gauge (Carter tool T109-189) at a 90° angle approximately 1/8" from its end (See Fig. 1).

2. Remove the choke housings, gasket and baffle plate and block the throttle about half open so the fast idle cam does not contact its adjusting screw.

3. Open the choke valve and insert the wire gauge so that the bent portion is between the top of the slot in the choke piston cylinder and the bottom of the slot in the piston (See Fig. 1). Hold the wire gauge in position and close the choke valve by pressing on the piston lever in the choke housing until resistance is felt. There

IMPORTANT: THIS BULLETIN CONTAINS INFORMATION OF VALUE TO YOU AND WAS PREPARED AT CONSIDERABLE EXPENSE TO BE OF SERVICE TO YOU FAILURE TO USE THIS INFORMATION MAY COST YOU MONEY. WE SUGGEST THAT YOU ISSUE COPIES OF IT TO TH SE OF YOUR STAFF INTERESTED. SO THAT THEY CAN BE FILED IN REGULAR CARTER SALES AND SERVICE MANUAL.

PRINTED IN U.S.A

should now be 11/64 (Carter gauge T109-166) between the top of the choke valve and the air horn (See Fig. 2).

4. To adjust, bend the choke connector rod.

5. When reassembling, set the climatic control one notch rich.

ACCELERATION COMPLAINTS (ENGINE AT OPERATING TEMPERATURE)

A few complaints have been received concerning a lag or flat spot in part throttle acceleration on cars equipped with either the BBD-2685S, 2733S Dual or AFB-2650S, 2651S, 2805S and 2806S Four Bore carbureters. The engine tune-up adjustments and the proper functioning of both the cooling system and manifold heat control thermostats should be checked first. Placing the accelerator pump connector rod in the long stroke position, in some cases, will overcome this complaint. The following carbureter changes will provide a slightly richer mixture if the complaint persists.

BBD-2685S, 2733S DUAL CARBURETERS

Install two (2) 75-1370 (.028") step-up rods in place of the original 75-1414 (.030") rods.

AFB-2650S, 2651S, 2805S and 2806S FOUR BORE CARBURETERS

Install two (2) 16-45 (.0635"X.055") step-up rods in place of the original 16-43 (.065"X.060") rods.

Parts 16-45 and 75-1370 have been used in other model carbureters and should be available in field stocks, however, an initial shipment of a limited number of each part is being made to Carter Central distributors.

Carter warranty is not involved in either the choke or metering correction.

CHRYSLER "V-8"

2741S Front Carburetor — MODEL LC3 "C300D" 1958 — 2742S Rear Carbureter

WCFB Four-Bore Down-Draft Climatic® Control Carbureters Nos. 2741S-2742S

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder 392 Cu. In. Engine

Dimensions: Flange size, 1-1/4 inch. Four Bore - 4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi (primary) size, 1-1/16 inch.
Main venturi (secondary) size, 1-1/4 inch I. D.

Vents: Outside, (4) in flange, (4) in air horn, Inside (7) in air horn.

Low Speed Circuit: (Primary side only). Jet, size No. 67 (032 inch) drill.
By-pass, size (.057 inch) diameter.
Economizer, size No. 54 (.055 inch) drill.
Idle bleed, size No. 44 (.086 inch) drill.
Idle port, slot type, length .156 inch, width .030 inch.

Idle Port Opening: .094 to .100 inch above top edge of valve with valve tightly closed.

Lower Port: (For idle adjustment screw), size No. 53 (.0595 inch) drill.

Set Idle Adjustment Screw: 1 to 2 turns open. For richer mixture turn screw out. Do not idle engine below 650 r.p.m. in neutral.

Idle Air Adjusting Screw: Seat size .187 inch diam t r.

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating bleed (primary, in plug) size No. 70 (.028 inch) drill, (secondary in plug) size No. 70 (.028 inch) drill.

Accelerating Pump: Discharge jet (twin) primary side nly size No. 74 (.0225 inch) drill.
Intake ball check seat, size .115 to .120 inch diam ter.
Discharge needle seat, size .070 inch diameter.

Choke: (2742S only) Carter Climatic® Contr l, set ne point rich. Butterfly type - offset choke valve, primary side only. Choke heat suction hole, restriction in bushing betw en air horn and piston housing size No. 50 (.070 inch) drill.

Vacuum Spark Port: (2742S only) Horiz ntal slot (round end) .064 x .120 inch. Top of port .006 to .014 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION. Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter..

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open:	Valve Setting (Hot)	Float Setting	Idle Adjustment Screw Setting
.035"	.017"	6° B.T.C. At Vibration Damper	Intake .015" Exhaust .024"	Primary 9/32 Inch (Use Gauge T109-284) Secondary 11/32 Inch (Use Gauge T109-285)	1 t 2 Turns Open Idl Engin at 650 R.P.M. In N utral

NOTE: These cars are equipped with Hydraulic Valve Lifters – NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made - lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. **VERTICAL ADJUSTMENT:** With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top center of float and machined surface of casting must be 9/32 inch (gauge T109-284) for primary floats and 11/32 inch (gauge T109-285) for secondary floats. Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be 23/32 inch. Adjust by bending stop tabs on float brackets.

PUMP ADJUSTMENT: Install pump connector link in center hole (medium stroke) of pump arm, with ends extending toward c untershaft arm. Back out throttle lever stop scr w until throttl valves seat in bores of carbureter. Hold straight edge across t p of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod. (Use tool T109-213).

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Pr cedure is as follows: 1. Back out throttle lever stop screw t all w throttle valves to seat in bores of carbureter and l osen m tering rod arm clamp screw. 2. With metering rods in place, pr ss down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

FAST IDLE ADJUSTMENT: (2742S only) (a) Loosen choke lever clamp screw on choke shaft. Insert. 010 inch feeler gauge (T109-200) between lip of fast idle cam and b ss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards cl sed p siti n hold in place and tighten clamp screw. (b) With choke valve tightly closed bend fast idle adjusting tang until there is .015 inch (gauge T109-44) opening between throttle valv and bore of carbureter side opposit idle port. Be sure fast idle adjusting tang is on high step f cam whil making this adjustment.

FAST IDLE ON CAR: (2742S only) 1450 R.P.M. hot engin with idle adjusting tang on high step of cam.

MARCA REGISTRADA

LITHO IN USA

UNLOADER ADJUSTMENT: (2742S only) With throttle wid open there should be 1/8 inch (gauge T109-36) clearance Between upper edg of ch ke valve and inner wall f air horn. Adjust by bending unloader lip on thr ttle shaft lever (us bending to l T109-41).

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be mad after completing pump and metering rod adjustments. Install dust c ver and dust cover gasket. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbur t r. There should be 1/16 inch (gauge T109-197) between lower edge f bowl vapor vent valve and dust cover. To adjust, r mov dust cover and bend vapor vent arm.

SECONDARY THROTTLE LEVER ADJUSTMENT: Primary and secondary throttle valves should reach wide open position at th same tim . To adjust, bend throttle operating rod at angle. (Use b nding tool T109-213). With primary and secondary throttle valv s in tightly closed position there should be .010 - .030 inch (gauge T109-29) cl arance between positive closing sh es n primary and sec ndary levers. To adjust, bend sh e n secondary lever.

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT: (2742S only) This adjustment should be made after completing fast idle and secondary throttle lever adjustments. Crack throttle valves and hold ch ke valve tightly closed. Then close thr ttle. L ck-out dog on auxiliary throttle shaft should freely engage in notch of lock-out arm. If necessary to adjusts, bend lock-out dog on auxiliary throttle shaft.

IDLE SPEED AND MIXTURE ADJUSTMENT (NORMAL ENGINE TEMP.): In making the idle adjustment on the engine the air adjustment screw is used to adjust idle speed in a similar manner as the throttle speed screw used previously. Turning the air adjustment screw outward increases engine speed, but also leans the mixture supplied to the manifold which must be compensated for by adjustment of the idle mixture adjusting screws.

Chrysler "V-8" – 1958 – Carbureters Nos. 2741S-2742S

WHEN SERVICING, USE GASKET ASSORTMENT NO. 310

CHRYSLER "V-8"

MODEL LC1

1958

(2733S Car Cooling)

BBD Dual Down-Draft Climatic® Control Carbureters Nos. 2685S-2733S

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder 354 Cu. In. Engine: Vacuum at Idle 19 5 Inches

Dimensions: Flange size 1¼ inch dual 4 bolt type Throttle bore 1 7/16 inch I D Primary venturi 3/8 inch I D Main venturi, 1 3/16 inch I D

Vent: Inside balance vent tube to bowl in air horn above choke valve Outside (2) in flange above throttle valve

Low Speed Circuit: Jet (in venturi assembly) size 0255 inch diameter Idle bleed (in venturi cluster screw) size 051 inch diameter Idle restriction (in venturi cluster screw) size 055 inch diameter Venturi idle bleed (in body) size 0472 inch diameter Idle port slot type length 189 inch width 030 inch

Idle Port Opening: 144 to 148 inch above upper edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw). Size 055 inch diameter

Set Idle Adjustment Screw: ½ to 1½ turns open For richer mixture turn screw out With gear shift lever in neutral position idle engine at 500 R P M

Main Nozzle: Nozzle is installed permanently DO NOT REMOVE

Main Vent Tube: Side holes 10—size 0433 inch I—size 0393 inch diameter Main vent in bottom of tube size 0393 inch diameter

Accelerating Pump: Pump discharge jets (2—in venturi cluster) size 0275 inch diameter Intake ball check seat size 130 to 140 inch diameter Discharge ball check seat size 110 to 120 inch diameter

Choke: Carter Climatic® Control set 1 point rich Butterfly type offset valve Choke heat suction hole in body size 075 inch diameter NOTE Thermostatic coil should not be removed from delayer mounting post If defective replace with complete thermostatic coil and housing assembly

Vacuum Spark Port Horizontal round end type 045 by 110 inch Top of port to be 025 to 035 inch above upper edge of valve with valve closed tight

Motor Tune-Up — Be Accurate!

CAUTION· Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open: 8° B. T. C. At Vibration Damper	Float Setting 9/32 Inch (Use Gauge T109-239)	Idle Adjustment Screw Setting ½ to 1½ Turns Open Idle Engine at 500 R. P. M. In Neutral

NOTE: These cars are equipped with Hydraulic Valve Lifters — NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

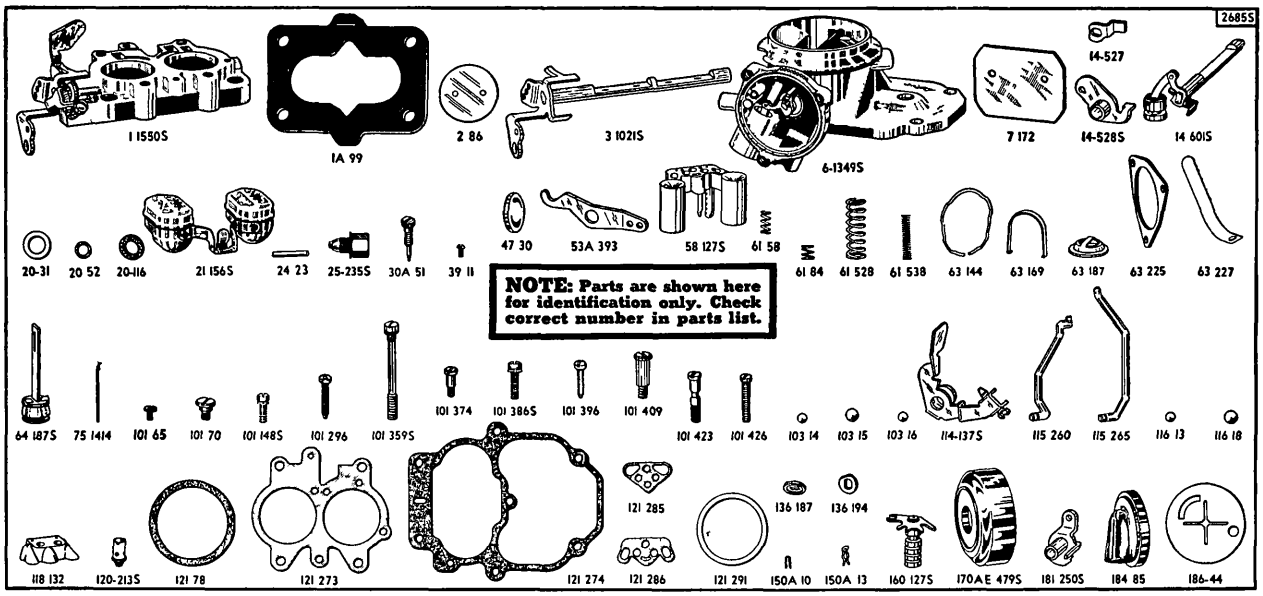
Adjustments Illustrated on Service Adjustment Procedure Form 3655

Float Level: 9/32 inch (gauge T109-239) between top of each float ridge (at center of float) and top surface of body casting To adjust bend lip on float arm

Pump: 1 1/32 inch from the top of the bowl cover to the top of the plunger shaft Install throttle connector rod in center hole (medium stroke) of throttle lever and inner hole of pump arm To adjust bend throttle connector rod

Fast Idle Cam Clearance: With choke valve closed and lip on inner choke shaft lever contacting lug on outer lever, align index mark on cam with adjusting screw To adjust. bend lip on inner choke lever

Fast Idle Throttle Valve Clearance: 015 inch (gauge T109 44) between lower edge of valve and bore with adjusting screw on high step of cam



Fast Idle on Car: 1400 R P M hot engine with adjusting screw on index mark of cam

Unloader. ¼ inch (gauge T109-31) between top edge of choke valve and inner wall of air horn with throttle valves wide open To adjust bend unloader arm on throttle lever

AFB Four-Bore Down-Draft Climatic® Control Carbureters Nos. 2651S-2806S

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder 392 Cu. In. Engine: Vacuum at Idle 19.5 Inches

Dimensions: Flange four bore—4 bolt type
Throttle bore, 1-7/16 inch.
Primary venturi size primary side 7/16 inch secondary side, 11/32 inch I D
Main venturi size, 1-3/16 inch

Vents: Inside (4) in air horn Outside (5) in air horn (4) in body

Low Speed Circuit (Primary Side only): Jet size No 68 (.031 inch) drill By-pass, size (.0492 inch) diameter Economizer size (.0452 inch) diameter Idle bleed size (.0492 inch) diameter Idle port slot type length .198 inch width .030 inch

Idle Port Opening: .142 to .148 inch above top edge of valve with valve tightly closed

Set Idle Adjustment Screw: 1/4 to 1 3/4 turns open For richer mixture turn screw out Do not idle engine below 500 r p m Transmission in neutral

Main Nozzle: Installed permanently DO NOT REMOVE Anti-percolator bleed primary, (tube in venturi assembly) size No 68 (.031 inch) drill Secondary, (drilled hole in venturi assembly) size No 60 (.040 inch) drill

Main Vent Tube: (In venturi assembly) Side holes primary side 1—size No 70 (.028 inch) 1—size No 65 (.035 inch) drill; secondary side 2—size No 57 (.043 inch) drill

Accelerating Pump: Discharge jet (twin primary side only size No 70 (.028 inch) drill Intake ball check seat (screw plug) size 115 to 120 inch diameter Discharge needle seat size No 50 (.070 inch) drill

Choke: Carter Climatic® Control set 1 point rich Butterfly type offset choke valve primary side only Choke heat suction hole restriction in body size No 50 (.070 inch) drill

Vacuum Spark Port: Slot type (round end) .045 x .110 inch Top of port .026 to .034 inch above top edge of valve with valve tightly closed

Motor Tune-Up — Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3725

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 5/16 inch (gauge T109-107) for 21-188S floats (identify by smooth sides); 7/32 inch (gauge T109-106) for 21-179S floats (identify by ribs on floats) between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 7/16 inch from the top of the bowl cover to the top of the plunger shaft, with throttle connector rod in center hole (medium stroke) of pump arm. To adjust, bend throttle connector rod.

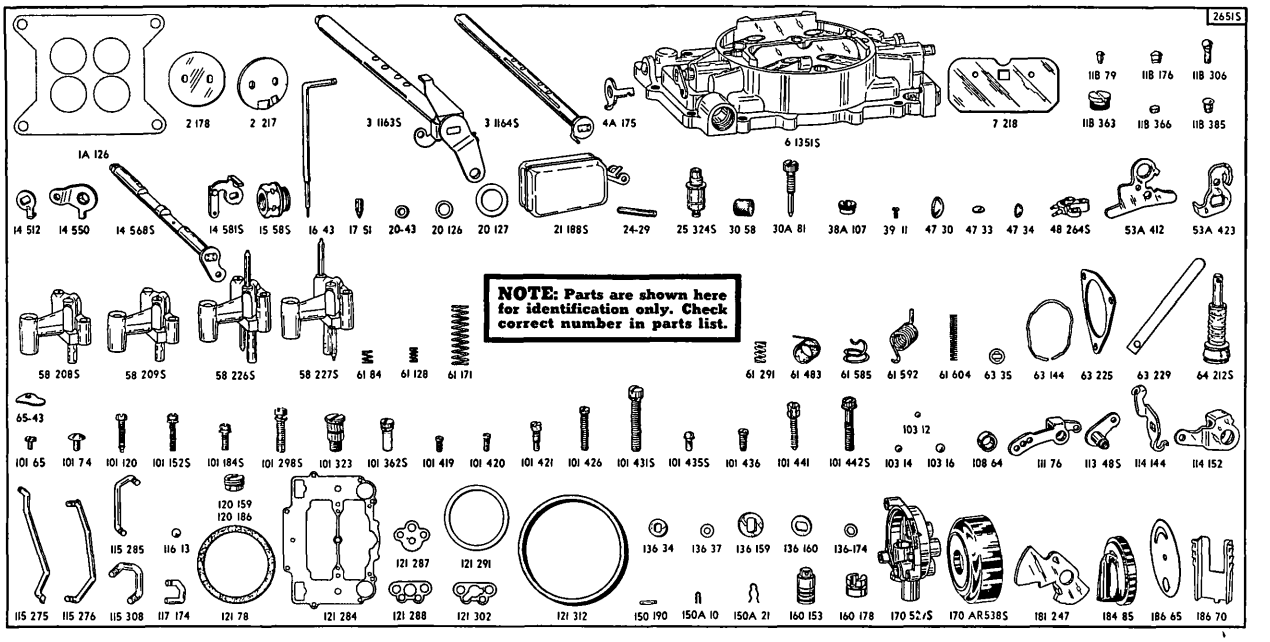
CHOKE PISTON LEVER ADJUSTMENT: .040 inch (gauge T109-193) between choke lever and stop in piston housing with choke valve closed. To adjust, bend choke connector rod.

FAST IDLE LINKAGE ADJUSTMENT: With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .012 inch (gauge T109-200) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 1400 R. P. M. hot engine with fast idle screw on index mark of cam.

UNLOADER: 1/4 inch (gauge T109-31) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.



SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 3/8 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: At wide open throttle primary and secondary valves will reach full vertical position. 3. With primary and secondary throttle valves in tightly closed position there should be .010" to .030" (gauge T109-29) between positive closing shoes on primary and secondary throttle lever. To adjust, bend shoe on secondary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.

TOOLS REQUIRED FOR SERVICING CARBURETERS:

T109-29 .020" Wire gauge	T109-107 5/16" Float gauge (early)
T109-31 1/4" Unloader gauge	T109-193 .040" Wire gauge
T109-41 Bending tool	T109-200 .012" Wire gauge
T109-106 7/32" Float gauge (late)	T109-213 Bending tool

CHRYSLER "V-8"

(Also used on Canadian De Soto, Model LS2 and Canadian Dodge, Model LD3)

MODEL LC2

(Power Pak)

1958

(Use 2805S and 15-58S to replace 2650S)

AFB Four-Bore Down-Draft Climatic® Control Carbureters Nos. 2650S-2805S

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder 354 Cu. In. Engine. Vacuum at Idle 19.5 Inches

Dimensions: Flange four bore — 4 bolt type
Throttle bore 1 7/16 inch
Primary venturi size primary side, 7/16 inch secondary side 11/32 inch I D
Main venturi size 1 3/16 inch

Vents: Inside (4) in air horn, Outside (5) in air horn (4) in body

Low Speed Circuit: (Primary side only) Jet, size No 68 (.031 inch) drill
By pass size (.0492 inch) diameter
Economizer size (.0452 inch) diameter
Idle bleed size (.0492 inch) diameter
Idle port slot type length .198 inch, width .030 inch.

Idle Port Opening .142 to .148 inch above top edge of valve with valve tightly closed

Set Idle Adjustment Screw: 1/4 to 1 3/4 turns open For richer mixture turn screw out Do not idle engine below 500 r p m Transmission in neutral

Main Nozzle: Installed permanently DO NOT REMOVE Anti percolator bleed primary (tube in venturi assembly) size No 68 (.031 inch) drill
Secondary (drilled hole in venturi assembly) size No 60 (.040 inch) drill.

Main Vent Tube: (In venturi assembly) Side holes primary side 1 1—size No. 70 (.028 inch) 1—size No 65 (.035 inch) drill secondary side 2—size No 57 (.043 inch) drill.

Accelerating Pump: Discharge jet (twin primary side only size No 70 (.028 inch) drill Intake ball check seat (screw plug) size .115 to .120 inch diameter Discharge needle seat size No 50 (.070 inch) drill.

Choke: Carter Climatic® Control set 1 point rich Butterfly type offset choke valve primary side only Choke heat suction hole restriction in body size No 50 (.070 inch) drill

Vacuum Spark Port: Slot type (round end) .045 x .110 inch Top of port .026 to .034 inch above top edge of valve with valve tightly closed

Motor Tune-Up — Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open. 6° B. T. D. C. At Vibration Damper	Float Setting (See Adjustments)	Idle Adjustment Screw Setting 1/4 to 1 3/4 Turns Open 500 R. P. M. In Neutral

NOTE: These cars are equipped with Hydraulic Valve Lifters — NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3725

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bent float lever.

FLOAT LEVEL: 5/16 inch (gauge T109-107) for 21-188S floats (identify by smooth sides); 7/32 inch (gauge T109-106) for 21-179S floats (identify by ribs on floats) between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 7/16 inch from the top of the bowl cover to the top of the plunger shaft, with throttle connector rod in center hole (medium stroke) of pump arm. To adjust, bend throttle connector rod.

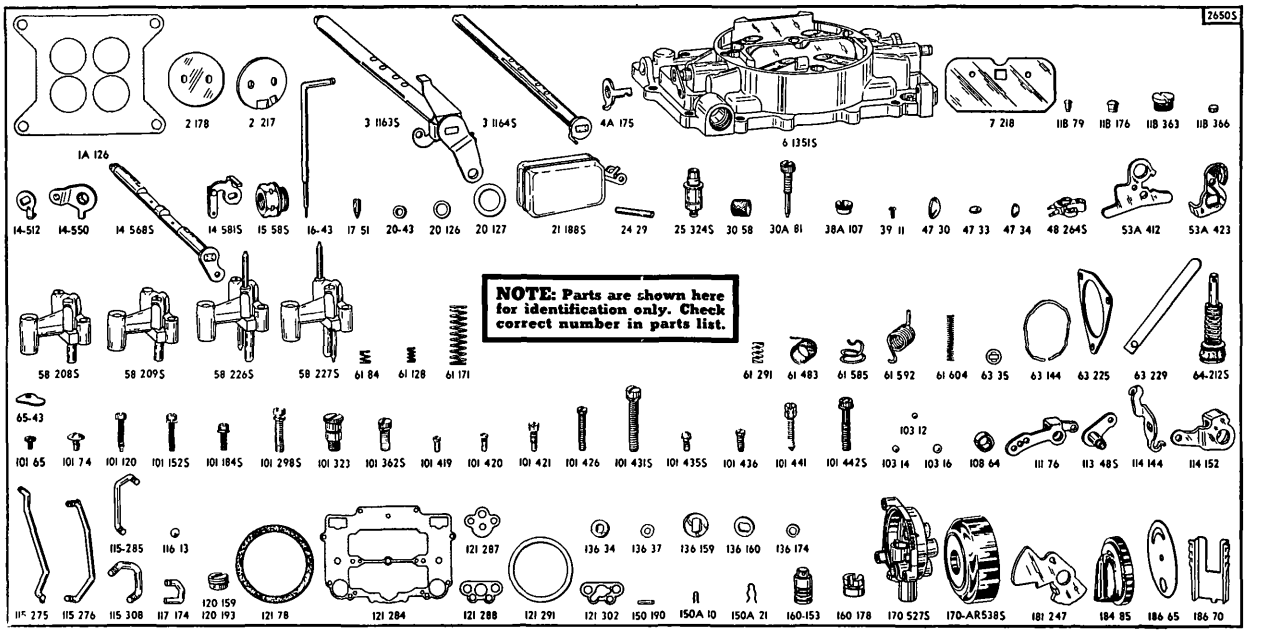
CHOKE PISTON LEVER ADJUSTMENT: .040 inch (Gauge T109-193) between choke lever and stop in piston housing with choke valve closed. To adjust, bend choke connector rod.

FAST IDLE LINKAGE ADJUSTMENT: With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .012 inch (Gauge T109-200) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 1400 R. P. M. hot engine with fast idle screw on index mark of cam.

UNLOADER: 1/4 inch (Gauge T109-31) between upper edge of choke valve and inner wall or air horn. To adjust, bend unloader lip on throttle lever.



SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 3/8 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: At wide open throttle primary and secondary valves will reach full vertical position. 3. With primary and secondary throttle valves in tightly closed position there should be .010" to .030" (Gauge T109-29) between positive closing shoes on primary and secondary throttle lever. To adjust, bend shoe on secondary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.

TOOLS REQUIRED FOR SERVICING CARBURETERS:

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder 354 Cu. In. Engine: Vacuum at Idle 19 Inches (C-75-2, LC2)

For Chrysler 8 Cylinder 392 Cu. In. Engine: Vacuum at Idle 19 Inches (C-76, IM-1, 2 & 3)

Dimensions: Flange, four bore — 4 bolt type
Throttle bore, 1 7/16 inch
Primary venturi size, primary side, 7/16 inch secondary side, 11/32 inch I D
Main venturi size 1-3/16 inch

Vent: Inside (4) in air horn, Outside (4) in body, (5) in air horn (2836 only).

Low Speed Jet Tube: (In venturi assembly, primary side only)
Jet, size No 68 (.031 inch) drill
By-pass, size (.0492 inch) diameter.
Economizer, size (.0452 inch) diameter
Idle bleed, size (.0492 inch) diameter

Idle Port: (Upper) slot type Primary, length .198 inch, width .030 inch. Secondary, none.

Idle Port Opening: Primary, .142 to .148 inch above top edge of valve with valve tightly closed Secondary, none

Set Idle Adjustment Screw: 1/4 to 1 3/4 turns open. For richer mixture turn screw out. Do not idle engine below 500 r p m Transmission in neutral

Main Nozzle: Installed permanently DO NOT REMOVE Anti-percolator bleed, primary (tube in venturi assembly), size No 68 (.031 inch) drill.
Secondary (drilled hole in venturi assembly), size No 60 (.040 inch) drill

Main Vent Tube: (In venturi assembly) Side holes primary side 1—size No 70 (.028 inch), 10—size No 65 (.035 inch) drill; secondary side 2—size No. 57 (.043 inch) drill

Accelerating Pump: Discharge jet (twin) primary side only, size No. 70 (.028 inch) drill. Intake ball check seat (screw plug) size .115 to .120 inch diameter. Discharge needle seat size No 50 (.070 inch) drill

Choke: Carter Climatic® Control set 1 point rich. Butterfly type offset choke valve, primary side only. Choke heat suction hole, restriction in body size No 50 (.070 inch) drill

Vacuum Spark Port: Slot type (round end) .045 x .110 inch Top of port .026 to .034 inch above top edge of valve with valve tightly closed

Motor Tune-Up — Be Accurate!

CAUTION. Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3725

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 5/16 inch (gauge T109-107) for 21-188S floats (identify by smooth sides): 7/32 inch (gauge T109-106) for 21-179S floats (identify by ribs on floats) between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 7/16 inch from the top of the bowl cover to the top of the plunger shaft with throttle connector rod in center hole (medium stroke) of pump arm. To adjust, bend throttle connector rod.

CHOKE PISTON LEVER ADJUSTMENT: (2448S-2686S) .040 inch (Gauge T109-193) (2836S) .067 inch (Gauge T109-234) between choke lever and stop in piston housing with choke valve closed. To adjust, bend choke connector rod.

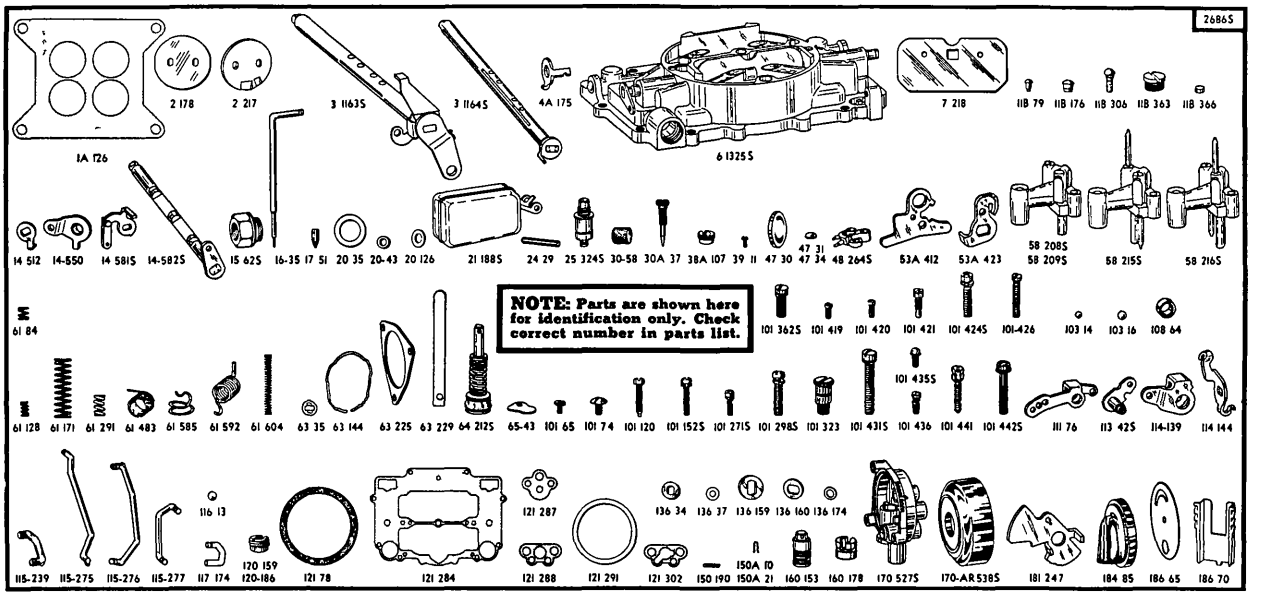
FAST IDLE LINKAGE ADJUSTMENT: With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .012 inch (Gauge T109-200) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: (2448S) 1450 to 1500, (2686S) 1300 to 1350, (2836S) 1400 R. P. M. hot engine with fast idle screw on index mark of cam.

UNLOADER: 1/4 inch (Gauge T109-31) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 19/64 inch (2448S-2686S), 3/8 inch (2836S) between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. **NOTE:** At wide open throttle primary and secondary valves will reach full vertical position. 3. With primary and secondary throttle valves in tightly closed position there should be .010" to .030" (gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.



SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.

TOOLS REQUIRED FOR SERVICING CARBURETERS:

T109-29	.020" Wire gauge	T109-107	5/16" Float gauge (early)
T109-31	1/4" Unloader gauge	T109-193	.040" Wire gauge
T109-41	Bending tool	T109-200	.012" Wire gauge
T109-106	7/32" Float gauge (late)	T109-213	Bending tool

T109-234 .067" Wire gauge

AFB Four-Bore Down-Draft Climatic® Control Carbureter No. 2448S

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder 392 Cu. In. Engine: Vacuum at Idle 19 Inches

Dimensions: Flange, four bore — 4 bolt type.
Throttle bore, 1-7/16 inch.
Primary venturi size, primary side, 7/16 inch, secondary side, 11/32 inch I. D.
Main venturi size, 1-3/16 inch.

Vents: Inside (4) in air horn; Outside (4) in body.

Gasoline Intake: Size No. 40 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: (In venturi assembly, primary side only.)
Jet, size No. 68 (.031 inch) drill.
By-pass, size (.0492 inch) diameter.
Economizer, size (.0452 inch) diameter.
Idle bleed, size (.0492 inch) diameter.

Idle Port: (Upper) slot type. Primary, length .198 inch; width .030 inch. Secondary, none.

Idle Port Opening: Primary, .142 to .148 inch above top edge of valve with valve tightly closed. Secondary, none.

Set Idle Adjustment Screw: 1/4 to 1 3/4 turns open. For richer mixture turn screw out. Do not idle engine below 500 r.p.m. Transmission in neutral.

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolator bleed, primary, (tube in venturi assembly) size No. 68 (.031 inch) drill.
Secondary, (drilled hole in venturi assembly) size No. 60 (.040 inch) drill.

Main Vent Tube: (In venturi assembly) Side holes primary side 1—size No. 70 (.028 inch), 10—size No. 65 (.035 inch) drill; secondary side 2—size No. 57 (.043 inch) drill.

Step-Up Rod: (Vacumeter type) see parts list for size.

Metering Jet: Primary, size .089 inch diameter (for step-up rod). Secondary size .0649 inch diameter (no step-up rod).

Accelerating Pump: Discharge jet (twin primary side only, size No. 70 (.028 inch) drill. Intake ball check seat (screw plug) size .115 to .120 inch diameter. Discharge needle seat size No. 50 (.070 inch) drill.

Choke: Carter Climatic® Control set 1 point rich. Butterfly type offset choke valve, primary side only. Choke heat suction hole, restriction in body size No. 50 (.070 inch) drill.

Vacuum Spark Port: Slot type (round end) .045 x .110 inch. Top of port .026 to .034 inch above top edge of valve with valve tightly closed.

Motor Tune-Up — Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open: 6° B. T. D. C. At Vibration Damper	Float Setting 5/16 Inch (Use Gauge T109-107)	Idle Adjustment Screw Setting 1/4 to 1 3/4 Turns Open 500 R. P. M. In Neutral

NOTE: These cars are equipped with Hydraulic Valve Lifters — NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3725

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 5/16 inch (gauge T109-107) between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 7/16 inch from the top of the bowl cover to the top of the plunger shaft, with throttle connector rod in center hole (medium stroke) of pump arm. To adjust, bend throttle connector rod.

CHOKE PISTON LEVER ADJUSTMENT: .040 inch (Gauge T109-193) between choke lever and stop in piston housing with choke valve closed. To adjust, bend choke connector rod.

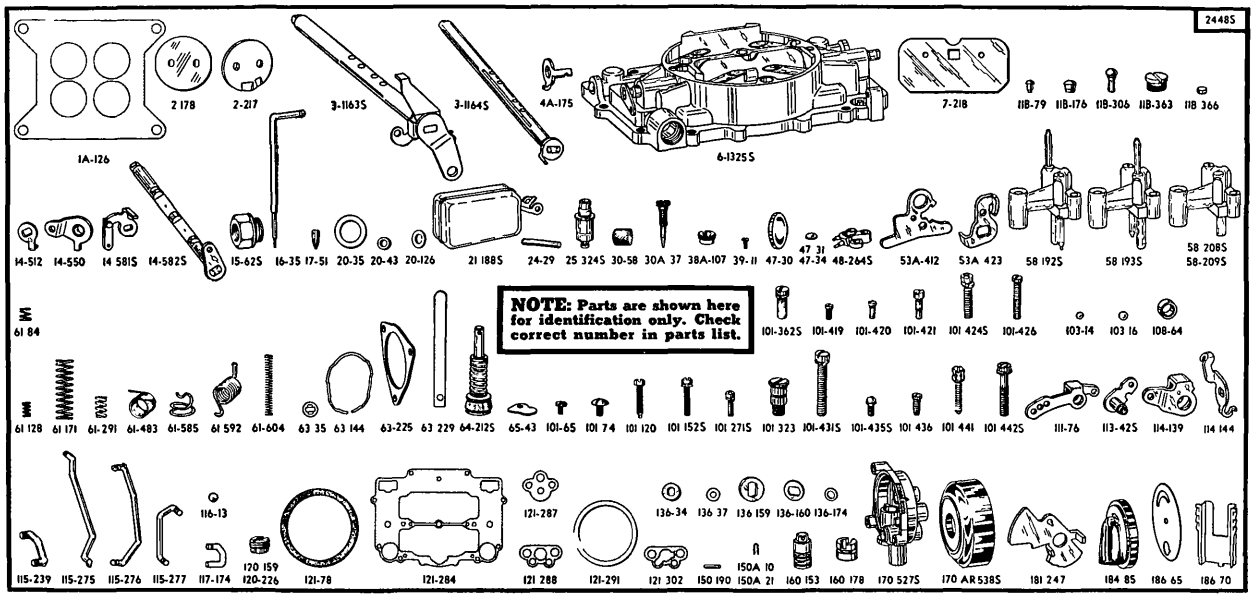
FAST IDLE LINKAGE ADJUSTMENT: With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .015 inch (Gauge T109-44) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 1450 to 1500 R.P.M. hot engine with fast idle screw on index mark of cam.

UNLOADER: 1/4 inch (Gauge T109-31) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 19/64 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: At wide open throttle primary and secondary valves will reach full vertical position. 3. With primary and secondary throttle valves in tightly closed position there should be .017" to .022" (gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.



SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.

TOOLS REQUIRED FOR SERVICING CARBURETERS:

CARTER MODEL AFB CARBURETER FOR CHRYSLER (SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the base of the carbureter, when requesting specification pages.

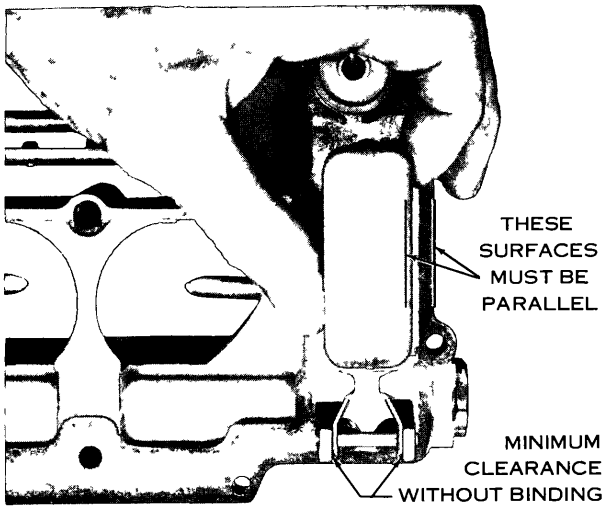

Figure 1

FLOAT ALIGNMENT ADJUSTMENT (Fig. 1):

1. Sight down the side of the float shell to determine if the side of the float is parallel to the outer edge of the air horn casting. TO ADJUST: Bend float lever by applying pressure to the end of the float shell with the fingers while supporting the float lever with the thumb.

   CAUTION: To avoid damaging the float, apply only enough pressure to bend float lever.

2. After aligning float, remove as much clearance as possible between arms of float lever and lugs on air horn by bending the float lever. Arms of float lever should be as parallel to the inner surfaces of lugs on air horn as possible.

   Floats must operate freely without excess clearance on its hinge pin.

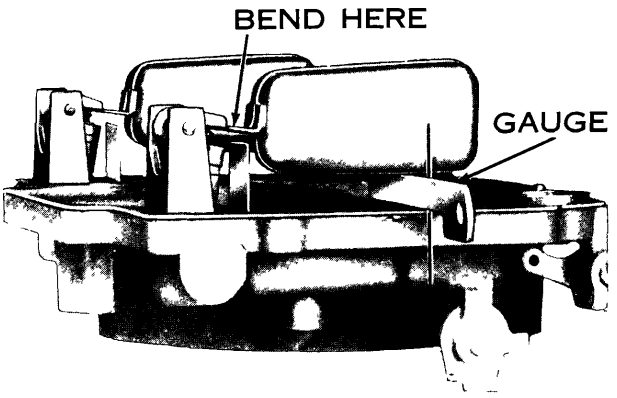

Figure 2

FLOAT LEVEL ADJUSTMENT (Fig. 2):

With air horn inverted, bowl cover gasket in place and needle seated, the clearance between top of float (at outer end) and air horn gask t should be as listed on carbureter specification page. To adjust, bend float arm. Adjust both floats. Rech ck float alignment.

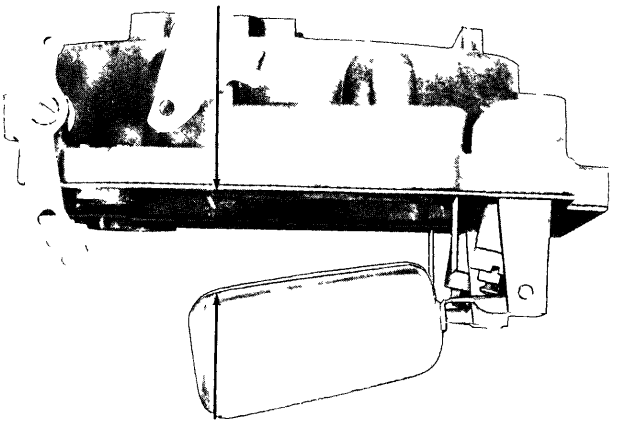

Figure 3

FLOAT DROP ADJUSTMENT (Fig. 3):

With bowl cover held in upright position and measuring from outer end of each float, the distance b tween top of floats and bowl cover gasket should be as listed on carbureter specification page. To adjust, bend stop tabs on float brackets.

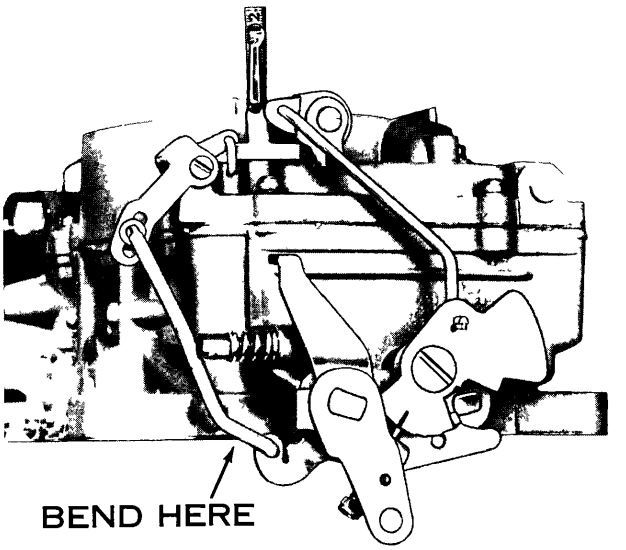

Figure 4

PUMP ADJUSTMENT (Fig. 4):

1. Back out idle speed screw until throttle valves seat in bores of carbureter. NOTE: Be sure fast idle adjusting screw does not contact fast idl cam and hold throttle valves open.
2. With throttle connector rod in center hole (medium stroke) of pump arm, the distance from the top of th bowl cover to the top of the plunger shaft should be as listed on carbureter specification page.
3. Adjust by bending throttl conn ctor rod at lower angl (use tool T109-213).

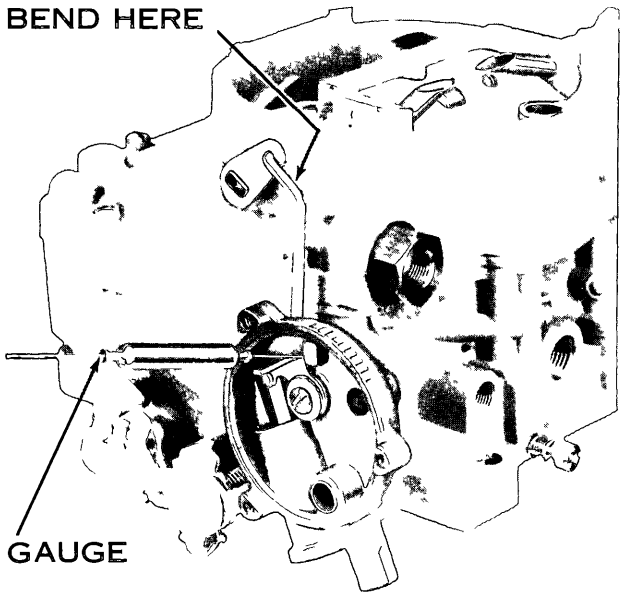

Figure 5

CHOKE PISTON LEVER ADJUSTMENT (Fig. 5):

With choke valve tightly closed, the clearance between choke lever and stop in piston housing should be as listed on carbureter specification page. To adjust, bend choke connect r rod (use tool T109-213).

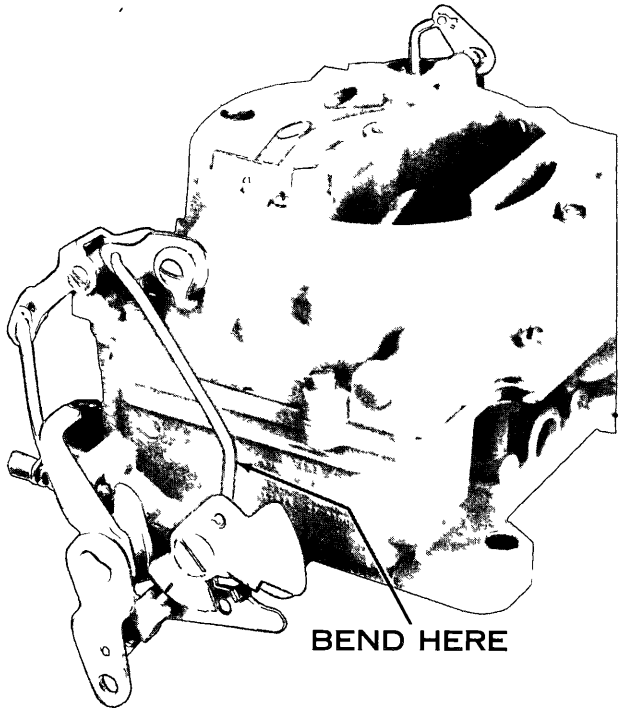

Figure 6

FAST IDLE LINKAGE ADJUSTMENT (Fig. 6):

With choke valve tightly clos d and lug on out r choke shaft lever contacting stop on inner choke shaft l v r align center of fast idle screw with index mark on cam. To adjust, b nd fast idl connector rod. (Us tool T109-213.)

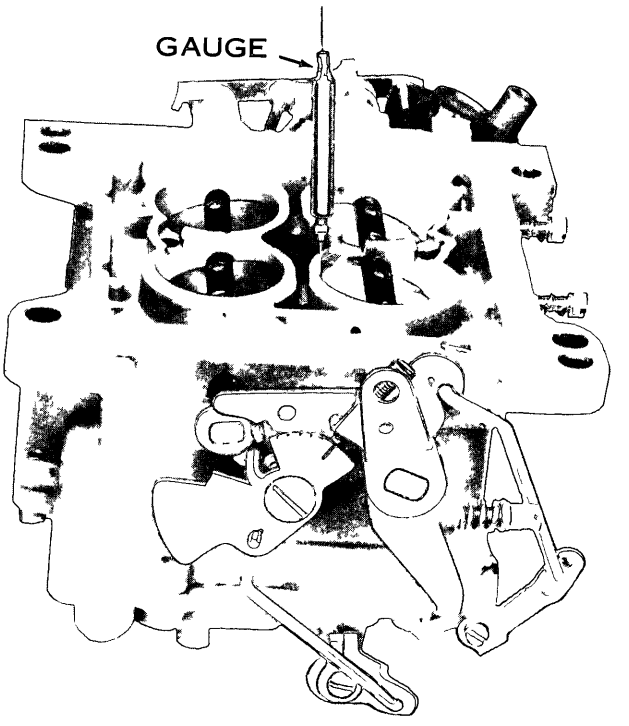

Figure 7

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 7):

With choke valve tightly closed, tighten fast idle adjusting screw (on index mark of cam) until the clearance between throttle valve and bore of carbureter, side opposite idle port, is as listed on carbureter specification page.

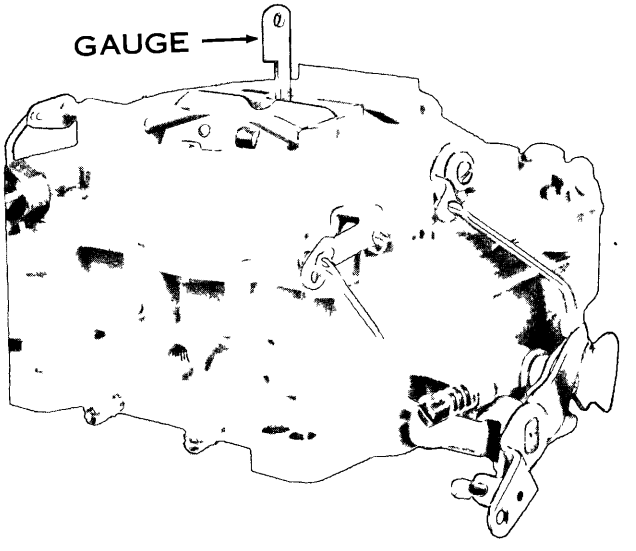

Figure 8

UNLOADER ADJUSTMENT (Fig. 8):

With throttl wide op n, the clearance betwe n upp r edg of choke valve and inner wall of air horn should b as list d on carbureter specification page. To adjust, b nd unload r lip on throttle shaft lever. (Use tool T109-41.)

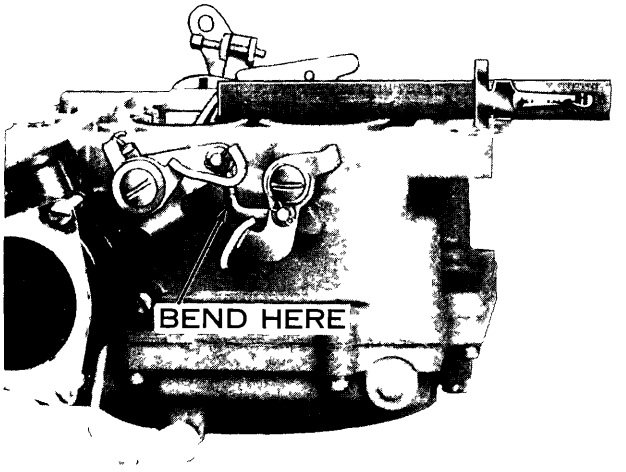

Figure 9A

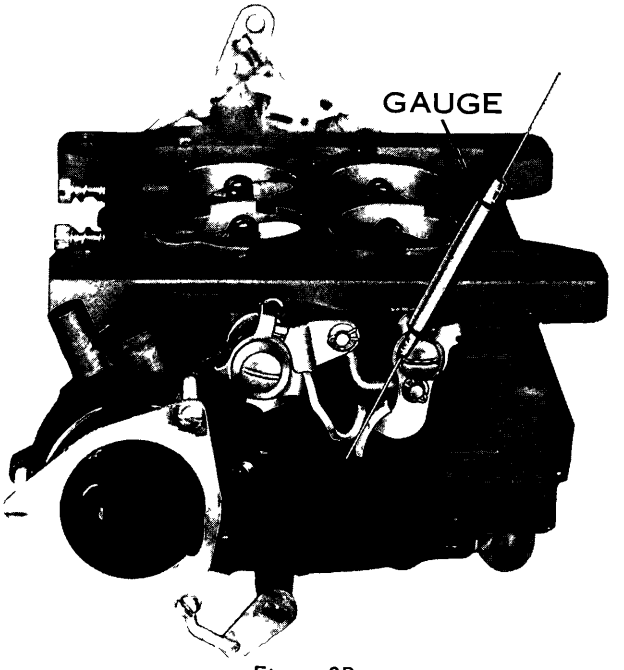

Figure 9B

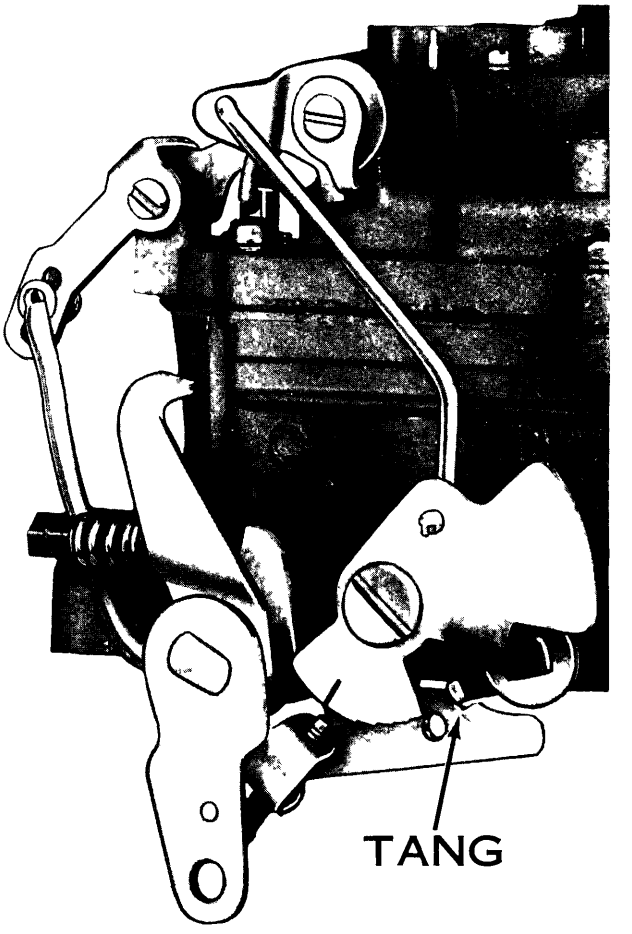
SECONDARY THROTTLE LEVER ADJUSTMENT (Figs. 9A and 9B):

1. Block choke valve wide open.

2. Secondary throttle valves should just start to open when primary throttle valves are opened to the clearance as listed on specification page between lower edge of valve and bore (opposite idle port). To adjust, bend throttle operating rod. (Use bending tool T109-213). (See Fig. 9A) NOTE: Primary and secondary throttle valves should reach wide open position, full vertical, at the same time.

3. With primary and secondary throttle valves in tightly closed position, there should be the clearance as listed on specification page between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever. (See Fig. 9B.)



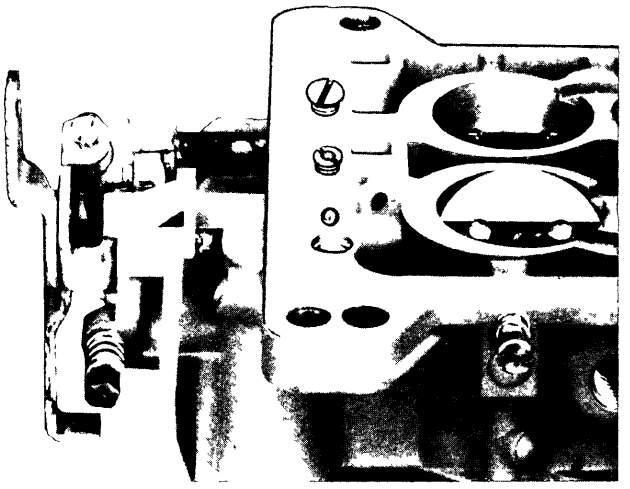


Figure 10

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 10):

Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. If necessary to adjust, bend tang on secondary throttle lever.

NOTE: See last page for pertinent service information.

(Fig. 11):

Pump intake check ball, seat and screw plug are removed by inverting carbureter and removing from lower side of flange.

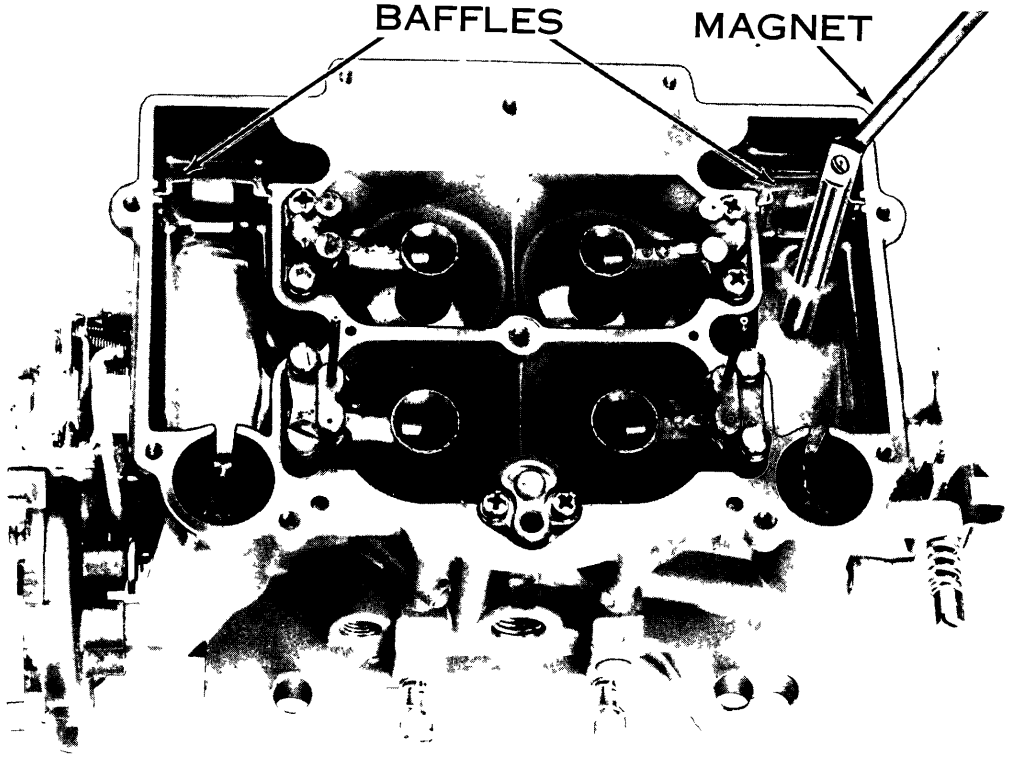

Figure 12

(Fig. 12):

Flooding, stumble on acceleration and other performance complaints are, in many instances, caused by the presence of dirt, water or other foreign matter in the carbureter. To aid in diagnosing the cause of the complaint, the carbureter should be carefully removed from the engine without draining the fuel from the bowl. The contents of the fuel bowl may th n be xamined for contamination as the carbureter is disassembled.

Check the fuel in the bowl for contamination by dirt, water, gum or other foreign matter. A magnet moved through the fuel in the b wl will pick up and identify any iron oxide dust that may have caused intake needle and seat leakage.

Inspect gasketed surfaces between body and air horn. Small nicks or burrs should be smoothed down to eliminate air or fuel leakage. Be especially particular when inspecting the top surface of the inner wall of the bowl around the vacuum piston passage. A poor seal at this location may contribute to a "cutting-out" on turns complaint.

Install fuel baffles as shown (Fig. 12) to prevent damage to floats.

Fill the carbureter bowl with clean fuel before installing on the manifold. This will help prevent dirt trapped in the fuel system from being dislodged by the free flow of fuel as the carbureter is primed. The operation of the floats and intake needle and s ats may be ch cked under pressur if a fuel pump is used at the bench to fill the carbureter bowl. Operate the throttle several times and visually check the discharge from the pump j ts.

Before installing the carbureter, hold choke valve open and turn th idle speed screw until it just contacts the throttle lever, then 1/2 a turn more to open the throttle valves en ugh to keep the engine running until the idle mixture and final R.P.M. adjustm nt can be made.

CHRYSLER MARINE "V-8" – 1957

Model M-45-3 Special

(Two Carbureters Per Engine)

WCFB FOUR-BORE DOWN-DRAFT **CARBURETER No. 2628S**

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder Engine 3.94 Inch Bore, 3 63 Inch Stroke

Dimensions Flange size 1⅛ inch Four Bore—4 Bolt type
Primary venturi size 11/32 inch I D
Main venturi size 1 1/16 inch I D

Vents Inside (5) Outside None

Gasoline Intake Size No 42 (0935 inch) drill, in needle seat

Low Speed Jet Tube Jet primary and secondary, size No 69 (0293 inch) drill By pass in body size primary No 52 (0635 inch) drill secondary (057 inch) diameter Econ omizer plug in body size (0452 inch) diameter Idle bleed in body size primary (059 inch) diameter secondary No 44 (086 inch) drill

Idle Port Upper slot type primary length 175 inch width 030 inch Secondary length 103 inch width 030 inch

Idle Port Opening Primary 116 to 122 inch secondary 059 to 065 inch above top edge of valve with valve tightly closed

Lower Port Primary (for idle adjustment screw) size No 55 (052 inch) drill
Secondary (no idle adjustment screw) size No 57 (043 inch) drill

Set Idle Adjustment Screw ¼ to 1¼ turns open For richer mixture turn screw out Do not idle engine below 500 R P M

Main Nozzle Installed permanently DO NOT REMOVE Anti percolating jet (4) size No 70 (028 inch) drill

Metering Rod Primary Economy step 078 inch diameter
Middle step tapers to 0/0 inch diameter
Power step 045 inch diameter
Secondary none

Metering Rod Jet Primary size 0935 inch diameter
Secondary size 055 inch diameter

Accelerating Pump Discharge jet (twin) primary side only size No 74 (0225 inch) drill Intake ball check seat size 115 to 120 inch diameter Discharge needle seat size No 50 (070 inch) drill Relief passage (vent) to fuel chamber size No 42 (0935 inch) drill

Choke Manual Butterfly type offset choke valve primary side only

Vacuum Spark Port None

Motor Tune-Up—Be Accurate!

CAUTION *Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter*

Spark Plug Gap .035"	Set Breaker Points 017"	Ignition Timing Breaker Points to Open T. D. C At Vibration Damper	Set Valves (Hot) Intake 015" Exhaust 028"	Float Setting Primary 5/32 Inch (Gauge T109-236) Secondary 7/32 Inch (Gauge T109-283)	Idle Adjustment Screw Setting ¼ to 1¼ Turns Open Idle engine at 500 R P M

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vertical **LATERAL ADJUSTMENT** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge Adjustment should be made by bending arms of floats
VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge Vertical distance between top of float and machined surface of casting must be 5/32 inch (gauge T109 236) for primary floats and 7/32 inch (gauge T109-283) for secondary floats Adjust by bending float arms
FLOAT DROP ADJUSTMENT With bowl cover held in upright position and measuring from center of floats, the distance between top of floats and bowl cover should be 21/32 inch for primary floats and 23/32 inch for secondary floats Adjust by bending stop tabs on float bracket
PUMP ADJUSTMENT Install pump connector link in center hole (medium stroke) of pump arm with ends extending toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at upper angle (Use tool T109-213)
METERING ROD ADJUSTMENT Metering rod adjustment is important and must be made after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacuumeter link until metering rods bottom in carburetor body casting 3 Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw
BOWL VAPOR VENT ADJUSTMENT This adjustment should be made after completing pump and metering rod adjustments Install dust cover and dust cover gasket Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent and dust cover To adjust remove dust cover and bend vapor vent arm

AUXILIARY THROTTLE VALVE ADJUSTMENT (a) Disconnect secondary throttle operating rod (b) Adjust stop lug on secondary throttle lever (use bending tool T109-214) until there is 27/64 inch clearance (gauge T109-242) between lower edge of auxiliary throttle valve and bore when lug is against stop on flange

SECONDARY THROTTLE LEVER ADJUSTMENT. The stop lug on both primary and secondary throttle levers should contact boss on flange at the same time To adjust bend secondary throttle operating rod at angle (use bending tool T109-213) NOTE Secondary throttle valves will be a few degrees from wide open position

Three Speed Automatic Transmission

BBS DOWN-DRAFT **CARBURETER No. 2624S**

CARBURETER SPECIFICATIONS

For Chrysler Ind Six Cylinder Engine· 3.25 Inch Bore, 4.63 Inch Stroke

Dimensions· Flange size 1½ inch S A E
Throttle bore 1-11/16 inch I D
Main venturi 1 11/32 inch I D

Vents Outside none Inside balance vent tube

Gasoline Intake· Size No 44 (.086 inch) drill in needle seat

Idle Tube. Jet size 0315 inch diameter Idle passage air bleed in body, size (.061 inch) diameter Restriction in body 057 inch diameter

Idle Port Upper slot type length 195 inch width 030 inch

Idle Port Opening. Top of port located 140 to 144 inch above top edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw) Size 053 to 057 inch diameter

Set Idle Adjustment Screw ½ to 1½ turns open For richer mixture turn screw out Idle engine between 450 500 r p m (transmission in neutral)

Main Metering Jet: Calibrated to flow 406 cc per minute (Do not gauge for size, if in doubt replace with new part)

Main Vent Tube: Side holes 6—.0354 inch diameter Bleed in top of tube .0236 inch diameter

Step-Up Rod: (Vacuum operated) .022 inch diameter

Accelerating Pump. Pump intake passage ball check seat size 110 to 120 inch diameter
Pump discharge passage restriction (under ball check) size 110 to 120 inch diameter in body
Pump (discharge) jet size 0275 inch drill

Choke Manual—butterfly type with poppet valve

Vacuum Spark Port· Slot type Size 030 x 110 inch Top of port 044 to 050 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .020"	Ignition Timing Breaker Points to Open· 2° B. T. C. At Vibration Damper	Valve Setting (Hot) Intake .010" Exhaust .014"	Float Setting 7/32 Inch (Use Gauge T109-239)	Idle Adjustment Screw Setting ½ to 1½ Turns Open Idle engine at 450 to 500 R.P.M.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: This adjustment must be made with the bowl cover gasket and float pin retainer removed Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots The distance from the top surface of the body casting to the top of each float should be 7/32 inch (gauge T109-239) If one float is lower than the other, equalize by bending the float arm If both floats require the same correction, adjust by bending lip

WCFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2590S**

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder Engine: 4.0 Inch Bore, 3.9 Inch Stroke

Dimensions Flange size 1¼ inch Four Bore—4 bolt type
Primary venturi size, 11/32 inch I D
Main venturi size 1-3/16 inch I D

Vents: Inside, (5)

Gasoline Intake Primary size No 38 (1015 inch) secondary, size No 42 (0935 inch) drill hole in needle seat

Low Speed Jet Tube: Jet (4) size 032 inch diameter
By pass in body (4) size No 52 (0635 inch) drill
Economizer (4) size No 56 (0465 inch) drill
Idle bleed, (4) in body size No 52 (0635 inch) drill.

Idle Port: Upper, slot type Primary, length 175 inch; width 030 inch Secondary, length 101 inch, width .030 inch.

Idle Port Opening: Primary 130 to 134 inch above top edge of valve with valve tightly closed Secondary, 071 to .077 inch

Lower Port: Primary (for idle adjustment screw) size No 53 (0595 inch) drill Secondary constant feed size 040 inch diameter

Set Idle Adjustment Screw: 1 to 2 turns open For richer mixture turn screw out Do not idle engine below 500 R P M in neutral

Main Nozzle: Installed permanently DO NOT REMOVE Anti percolating bleed (to nozzle well), primary side (to idle well), secondary side size No 70 (028 inch) drill

Metering Rod: (Vacumeter type) see parts list for size

Metering Rod Jet: Primary, size 0935 inch diameter (for metering rod).
Secondary, size 0635 inch diameter (no metering rod)

Accelerating Pump: Discharge jet (twin) primary side only size No 72 (025 inch) drill
Intake ball check seat, size 115 to 120 inch diameter
Discharge needle seat, size 070 inch diameter
Relief passage (vent) to fuel chamber No 42 (0935 inch) drill.
Discharge relief plug size No 55 (052 inch) drill

Choke: Carter Climatic® Control, set one point rich Butterfly type, offset choke valve primary side only Choke heat suction hole bushing between piston housing and air horn size No 50 (070 inch) drill

Vacuum Spark Port: Horizontal slot (round end) 045 by 110 inch Top of port 032 to 042 inch above valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open: 6° B. T. C. MARCA REGISTRADA

S S PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vertical **Lateral Adjustment** Side of floats should just clear the vertical uprights of float gauge Adjustment should be made by bending arms of floats **Vertical Adjustment** With bowl gasket removed vertical distance between top of float and machined surface of casting must be 5/32 inch (gauge T109 236) for primary floats and 9/32 inch (gauge T109 284) for secondary floats Adjust by bending float arms

FLOAT DROP ADJUSTMENT With bowl cover held in upright position and measuring from center of floats the distance between top of floats and bowl cover should be 21/32 inch for primary floats and 25/32 inch for secondary floats Adjust by bending stop tabs on float bracket

PUMP ADJUSTMENT Install pump connector link in center hole (medium stroke) of pump arm with ends extending outward toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109 213)

METERING ROD ADJUSTMENT Metering rod adjustment must be made after pump adjustment 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throtle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

BOWL VAPOR VENT ADJUSTMENT This adjustment should be made after completing pump and metering rod adjustments Install dust cover and dust cover gasket Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter There should be 1/16 inch (gauge T109 197) between lower edge of bowl vapor vent valve and dust cover To adjust remove dust cover and bend vapor vent arm

FAST IDLE ADJUSTMENT (a) Loosen choke lever clamp screw on choke shaft Insert 020 inch wire gauge (T109 29) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (b) With choke valve tightly closed tighten fast idle adjusting screw until there is 012 inch (gauge T109 200) opening between throttle valve and bore of carbureter side opposite idle port Be sure fast idle adjusting screw is on high step of cam while making this adjustment

FAST IDLE ON CAR 1450 to 1500 R P M with fast idle screw on high step of cam

UNLOADER ADJUSTMENT With throttle wide open there should be 15/64 inch (gauge T109 32) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109 41)

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT This adjustment should be made after completing fast idle adjustment Crack throttle valves and manually open and close the choke valve Tang on secondary throttle lever should freely engage in notch of lock out dog It necessary to adjust bend tang on secondary throttle lever

PRIMARY THROTTLE SHAFT DOG ADJUSTMENT

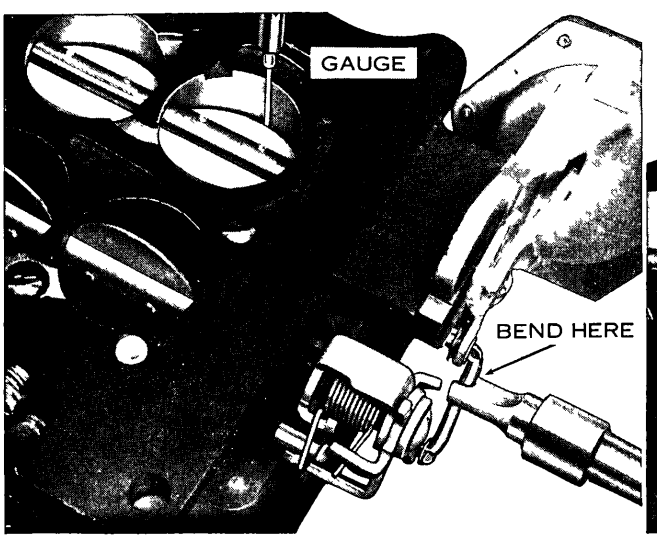

Figure 1

With primary throttle valves in wide open position adjust (use tool T109 213) secondary operating rod so there is 054" to 064" clearance (gauge T109 193) between upper edge of secondary throttle valves (next to idle port) and bore of carbureter (Fig 1)

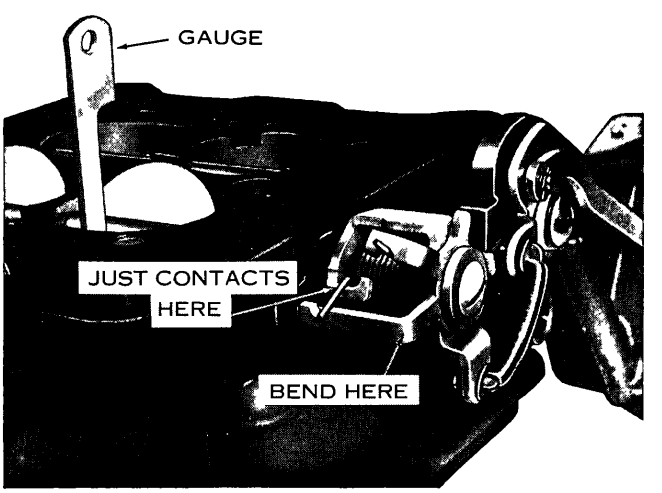

Figure 2

Place 1/4" gauge (tool T109 31) between upper edge of primary throttle valve and bore (next to idle port) and adjust (use tool T109 214) long tang on primary throttle shaft dog so that inner arm of spring just contacts inner lug of secondary operating lever and secondary throttle valves just start to open (Fig 2)

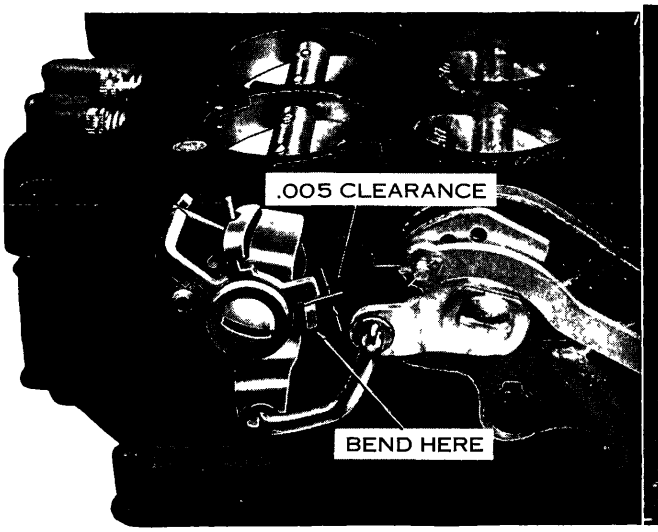

Figure 3

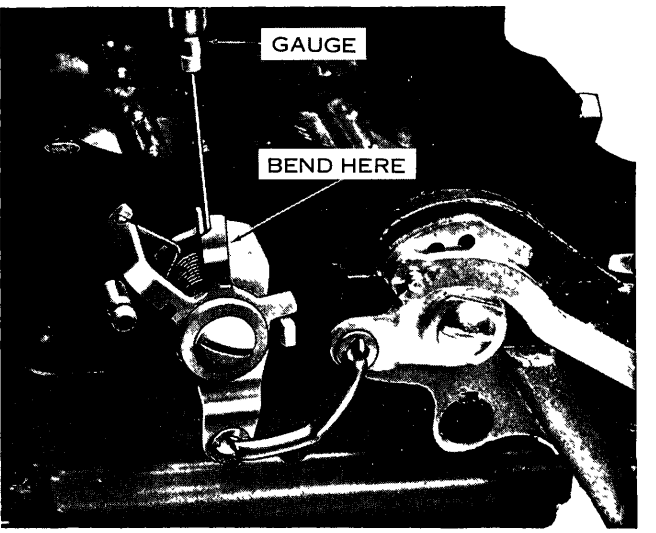
With primary and secondary throttle valves tightly seated, there should be .005" clearance (gauge T109-237) between outer lip on secondary operating lever and stop lug on primary throttle shaft dog.

TO ADJUST: Bend outer lip on secondary operating lever (use tool T109-214).

CAUTION: After bending, be sure secondary operating lever operates freely and does not bind in any position (Fig. 3).



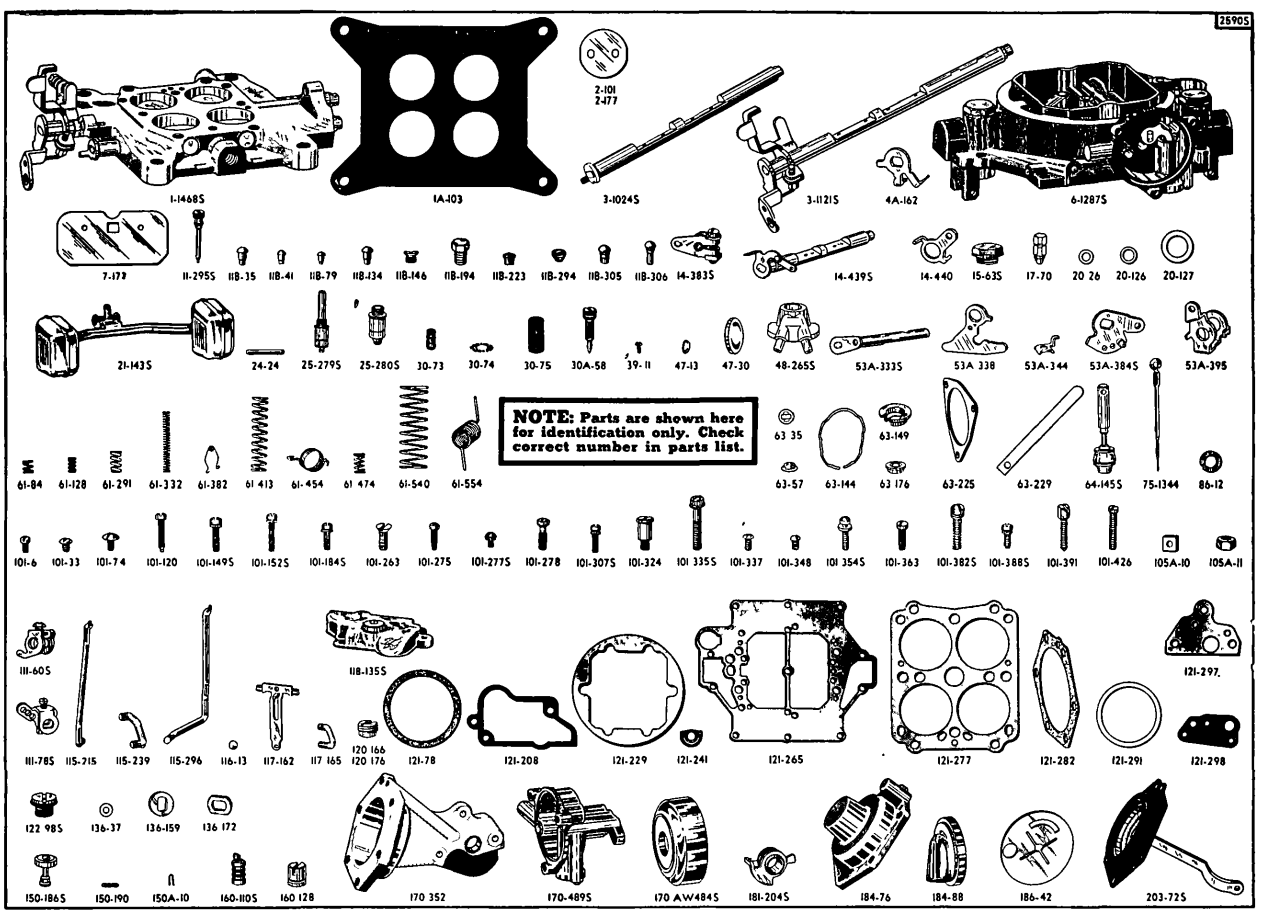


Figure 4

With primary and secondary throttle valves tightly closed, there should be .040" clearance (gauge T109-193) between short tang on primary throttle shaft dog and outer arm of spring.

TO ADJUST: Bend short tang on primary throttle shaft dog (use tool T109-214) (Fig. 4).

Chrysler "V-8"—1957—Carbureter No. 2590S

(See Page 4 for above parts group identification.)

Chrysler "V-8"—1957—Carbureter No. 2590S

WHEN SERVICING, USE GASKET ASSORTMENT No. 297; REPAIR PACKAGE No. 1869

PART NAMES IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No.	PART NAME	
1-1468S	Body flange assembly	
1A-103	FLANGE GASKET	
2-101	Primary throttle valve	(2)
2-177	Secondary throttle valve	(2)
3-1024S	Secondary throttle shaft and dog assembly	
3-1121S	Primary throttle shaft and lever assembly	
4A-162	Primary throttle shaft dog	
6 1287S	Air horn assembly

63-225	Coil housing retainer	
63-229	Heat tube retainer	
64-145S	PUMP PLUNGER AND ROD ASSEMBLY	
75-1344	METERING ROD—STANDARD 071"x 062" x 048"	(2)
75-1336	Metering rod 2 sizes lean 072" x 065" x 058"	(2)
75-1365	Metering rod 1 size lean 072" x 064" x 055"	(2)

Part No.	PART NAME	
86-12	Flange stud lock washer	(4)
101-6	Pump arm clamp screw	
101-33	Metering rod arm clamp screw	
101-74	Throttle shaft screw	(2)
101-120	Fast idle adjustment screw	
101-149S	Body flange attaching screw and washer assembly	
101-152S	Air horn attaching screw and washer assembly	
101-184S	Dust cover attaching screw and washer assy	(2)
101-263	Diaphragm housing attaching screw	(3)
101-275	Piston housing attaching screw	
101-277S	Vent arm attaching screw and washer assembly	
101-278	Pump jet housing attaching screw	
101-307S	Air horn attaching screw and washer assembly	(8)
101-324	Fast idle cam attaching screw	
101-335S	Air horn attaching screw and washer assembly	(7)
101-337	Secondary throttle valve attaching screw	(4)
101-348	Primary throttle valve attaching screw	(4)
101-354S	Choke lever clamp screw assembly	
101-363	Piston housing attaching screw	(2)
101-382S	Body flange attaching screw and washer assy	(3)
101-388S	Diaphragm housing cover attaching screw and washer assembly	(6)
101-391	Throttle lever adjusting screw	
101-426	Coil housing attaching screw	(3)
103-14	Lead shot (late prod)	(3)
105A-10	Choke lever clamp screw nut	
105A-11	Flange stud nut	(4)
111-60S	Metering rod arm and screw assembly	
111-78S	Pump arm and screw assembly	
115-215	Choke connector rod	
115-239	Throttle operating rod	
115-296	THROTTLE CONNECTOR ROD	
116-13	PUMP INTAKE CHECK BALL	
117-162	Vacumeter piston link	
117-165	Pump connector link	
118-102S	Dust cover assembly	
118-135S	Dust cover assembly (Sup by 118 102S)	
120-166	PRIMARY METERING ROD JET	(2)
120-176	SECONDARY METERING JET	(2)
121-78	COIL HOUSING GASKET	
121-208	DUST COVER GASKET	
121-229	AIR CLEANER GASKET	
121-241	PUMP JET HOUSING GASKET	
121-265	AIR HORN GASKET	
121-277	BODY FLANGE GASKET	
121-282	GASKET (DIAPHRAGM TO LOWER HOUSING	
121-291	HEAT TUBE CAP GASKET	
121-297	DIAPHRAGM HOUSING TO FLANGE GASKET	
121-298	PISTON HOUSING GASKET	
122-98S	PUMP RELIEF PLUG ASSEMBLY	
136-37	Throttle connector rod and operating rod washer	(5)
136-159	Primary throttle shaft washer	
136-172	Secondary throttle shaft washer	
150-186S	Pin and valve cap assembly	
150-190	Choke piston pin	
150A-10	PIN SPRING	(5)
160-110S	Vacuum piston and pin assembly	
160-128	Choke piston	
170-352	Diaphragm housing	
170-489S	Piston housing and plug assembly	
170AW-484S	Thermostatic coil and housing assembly	
181-204S	Fast idle cam assembly	
184-76	Diaphragm housing cap	
184-88	Choke heat tube cap	
186-42	Choke baffle plate	
203-72S	Secondary throttle shaft diaphragm assembly	

NOTE Figures in parentheses indicate number of pieces used in one carbureter. Where no figure is shown, only one is used.

CHRYSLER "V-8"

MODEL C-75-2

(POWER PACKAGE)

1957

WCFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2589S**

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder Engine 3 94 Inch Bore, 3 63 Inch Stroke

Dimensions Flange size 1¼ inch Four Bore—4 bolt type
Primary venturi size 11/32 inch I D
Main venturi size 1 3/16 inch I D

Vents Inside (5)

Gasoline Intake Primary size No 38 (1015 inch) secondary size No 42 (0935 inch) drill hole in needle seat

Low Speed Jet Tube Jet (4) size 032 inch diameter
By pass in body (4) size No 52 (0635 inch) drill
Economizer (4) size No 56 (0465 inch) drill
Idle bleed (4) in body size No 52 (0635 inch) drill

Idle Port Upper slot type Primary length 175 inch width 030 inch Secondary length 101 inch width 030 inch

Idle Port Opening Primary 130 to 134 inch above top edge of valve with valve tightly closed Secondary 071 to 077 inch

Lower Port Primary (for idle adjustment screw) size No 53 (0595 inch) drill Secondary constant feed size 040 inch diameter

Set Idle Adjustment Screw ¾ to 1¾ turns open For richer mixture turn screw out Do not idle engine below 500 R P M in neutral

Main Nozzle Installed permanently DO NOT REMOVE Anti-percolating bleed (to nozzle well) primary side (to idle well) secondary side size No 70 (028 inch) drill

Metering Rod (Vacumeter type) see parts list for size

Metering Rod Jet Primary size 0935 inch diameter (for metering rod)

Secondary size 061 inch diameter (no metering rod)

Accelerating Pump Discharge jet (twin) primary side only size No 72 (025 inch) drill

Intake ball check seat size 115 to 120 inch diameter

Discharge needle seat size 070 inch diameter

Relief passage (vent) to fuel chamber No 42 (0935 inch) drill

Discharge relief plug size No 55 (052 inch) drill

Choke Carter Climatic® Control set one point rich Butterfly type offset choke valve primary side only Choke heat suction hole bushing between piston housing and air horn size No 50 (070 inch) drill

Vacuum Spark Port Horizontal slot (round end) 045 by 110 inch Top of port 032 to 042 inch above valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap 035"	Breaker Point Setting 017"	Ignition Timing Breaker Points to Open 6° B T C. At Vibration Damper	Float Setting Primary 5/32 Inch (Use Gauge T109-236) Secondary 9/32 Inch (Use Gauge T109-284)	Idle Adjustment Screw Setting ¾ to 1¾ Turns Open Idle Engine at 500 R P M. In Neutral

NOTE These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. **Lateral Adjustment:** Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. **Vertical Adjustment:** With bowl gasket removed, vertical distance between top of float and machined surface of casting must be 5/32 inch (gauge T109-236) for primary floats; and 9/32 inch (gauge T109-284) for secondary floats. Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of floats, the distance between top of floats and bowl cover should be 21/32 inch for primary floats and 25/32 inch for secondary floats. Adjust by bending stop tabs on float bracket.

PUMP ADJUSTMENT: Install pump connector link in center hole (medium stroke) of pump arm, with ends extending outward toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment must be made after pump adjustment. 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020 inch wire gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw. (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is .012 inch (gauge T109-200) opening between throttle valve and bore of carbureter, side opposite idle port. Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

FAST IDLE ON CAR: 1350 to 1400 R.P.M. hot engine, with fast idle screw on high step of cam.

UNLOADER ADJUSTMENT: With throttle wide open there should be 15/64 inch (gauge T109-32) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle adjustment. Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. If necessary to adjust, bend tang on secondary throttle lever.

PRIMARY THROTTLE SHAFT DOG ADJUSTMENT:

Block choke valve wide open.

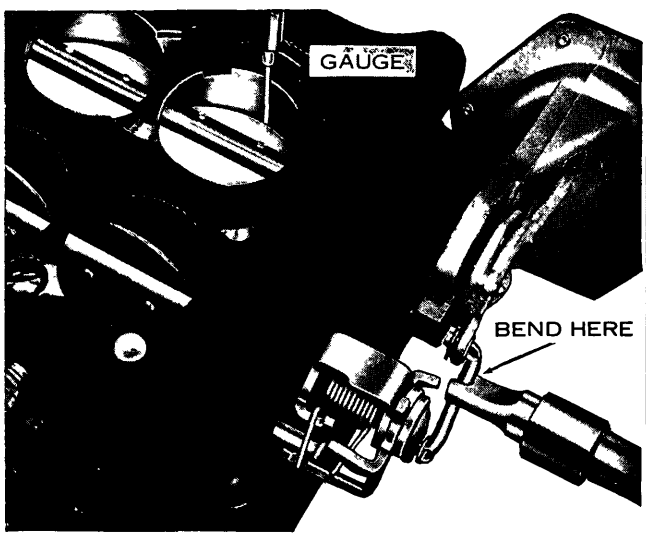

Figure 1

With primary throttle valves in wide open position, adjust (use tool T109-213) secondary operating rod so there is .054" to .064" clearance (gauge T109-193) between upper edge of secondary throttle valve (next to idle port) and bore of carbureter (Fig. 1).

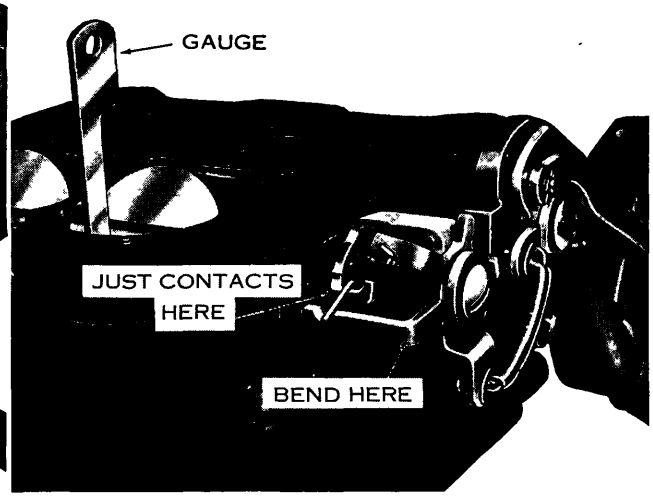

Figure 2

Place 1/4" gauge (tool T109-31) between upper edge of primary throttle valve and bore (next to idle port) and adjust (use tool T109-214) long tang on primary throttle shaft dog so that inner arm of spring just contacts inner lug of secondary operating lever and secondary throttle valves just start to open (Fig. 2).

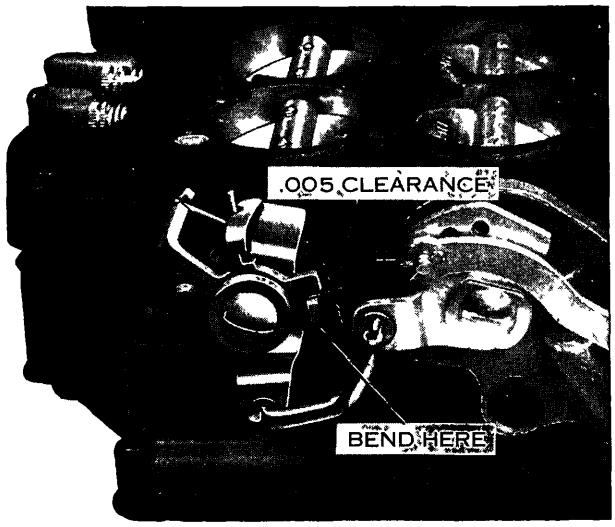

Figure 3

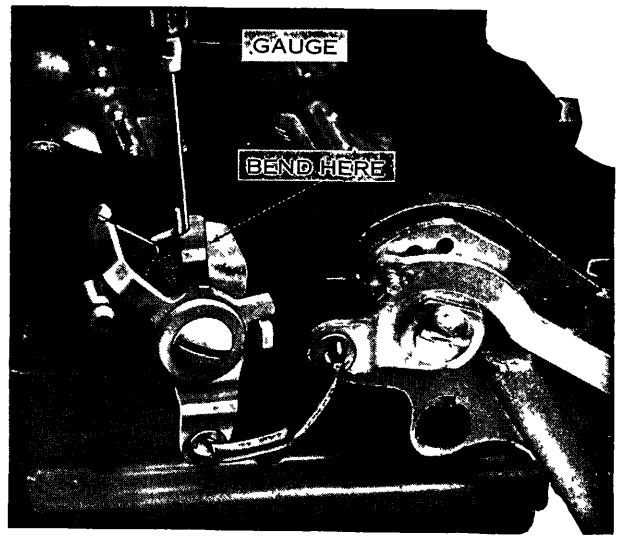
With primary and secondary throttle valves tightly seated there should be 005" clearance (gauge T109-237) between outer lip on secondary operating lever and stop lug on primary throttle shaft dog

TO ADJUST Bend outer lip on secondary operating lever (use tool T109-214)

CAUTION After bending, be sure secondary operating lever operates freely and does not bind in any position (Fig 3)



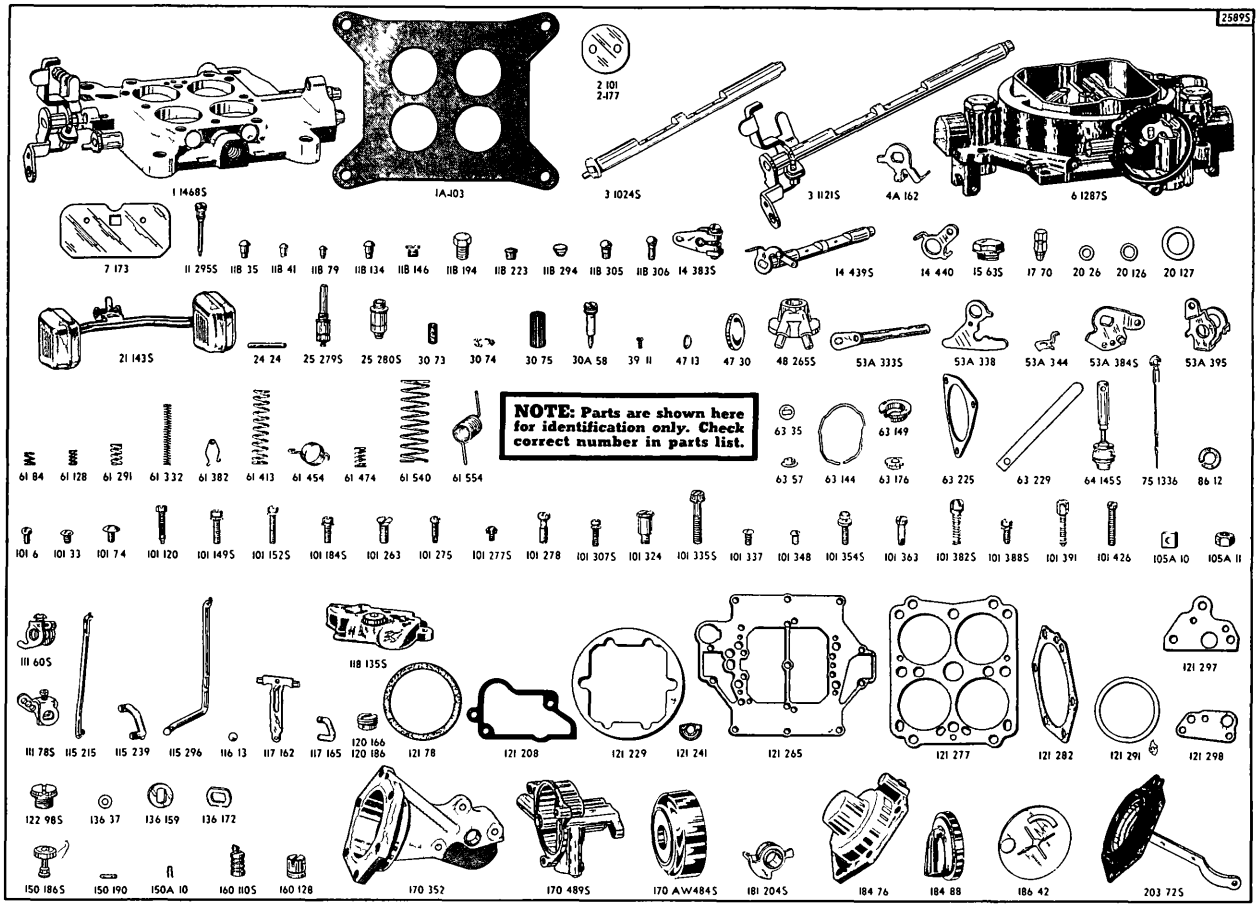


Figure 4

With primary and secondary throttle valves tightly closed there should be 040" clearance (gauge T109-193) between short tang on primary throttle shaft dog and outer arm of spring

TO ADJUST Bend short tang on primary throttle shaft dog (use tool T109 214) (Fig 4)

1957

BBD Dual Down-Draft Climatic® Control **Carbureter No. 2527S**

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder Engine 3 94 Inch Bore 3 63 Inch Stroke

Dimensions Flange size 1¼ inch dual 4 bolt type Throttle bore 1 7/16 inch I D Primary venturi ⅜ inch I D Main venturi 1 3/16 inch I D

Vent Inside balance vent tube to bowl in air horn above choke valve

Gasoline Intake Size No 38 (1015 inch) drill hole in needle seat

Idle Tube Jet in venturi assembly size 0255 inch diameter Idle bleed (in venturi cluster screw) size 051 inch diameter Idle restriction (in venturi cluster screw) size 055 inch diam eter Venturi idle bleed in body size 0472 inch diameter

Idle Port Upper slot type length 189 inch width 030 inch

Idle Port Opening 144 to 148 inch above upper edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw) Size 053 to 057 inch diameter

Set Idle Adjustment Screw ½ to 1½ turns open For richer mixture turn screw out With gear shift lever in neutral position idle engine at 500 R P M

Main Nozzle Nozzle is installed permanently DO NOT RE MOVE

Main Vent Tube Side holes 10—size 0433 inch 1—size 0393 inch diameter Main vent in bottom of tube size 0393 inch diameter

Step-Up Rod (Vacuum operated) See parts list for size

Metering Jet See parts list for calibrated flow per minute

Accelerating Pump Pump discharge jets (2—in venturi cluster) size 0275 inch diameter Intake ball check seat size 130 to 140 inch diameter Discharge ball check seat size 110 to 120 inch diameter

Choke Carter Climatic® Control set 1 point rich Butterfly type offset valve Choke heat suction hole in body size 063 inch diameter NOTE Thermostatic coil should not be removed from delayer mounting post If defective replace with complete thermostatic coil and housing assembly

Vacuum Spark Port Horizontal round end type (early prod) 030 by 110 (late prod) 045 by 110 inch Top of port to be (early prod) 035 to 045 inch (late prod) 025 to 035 inch above upper edge of valve with valve closed tight

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

Spark Plug Gap 035"	Breaker Point Setting 017"	Ignition Timing Breaker Points to Open 6° B T. C At Vibration Damper	Float Setting See Adjustments	Idle Adjustment Screw Setting ½ to 1½ Turns Open Idle Engine at 500 R.P.M

NOTE These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3655

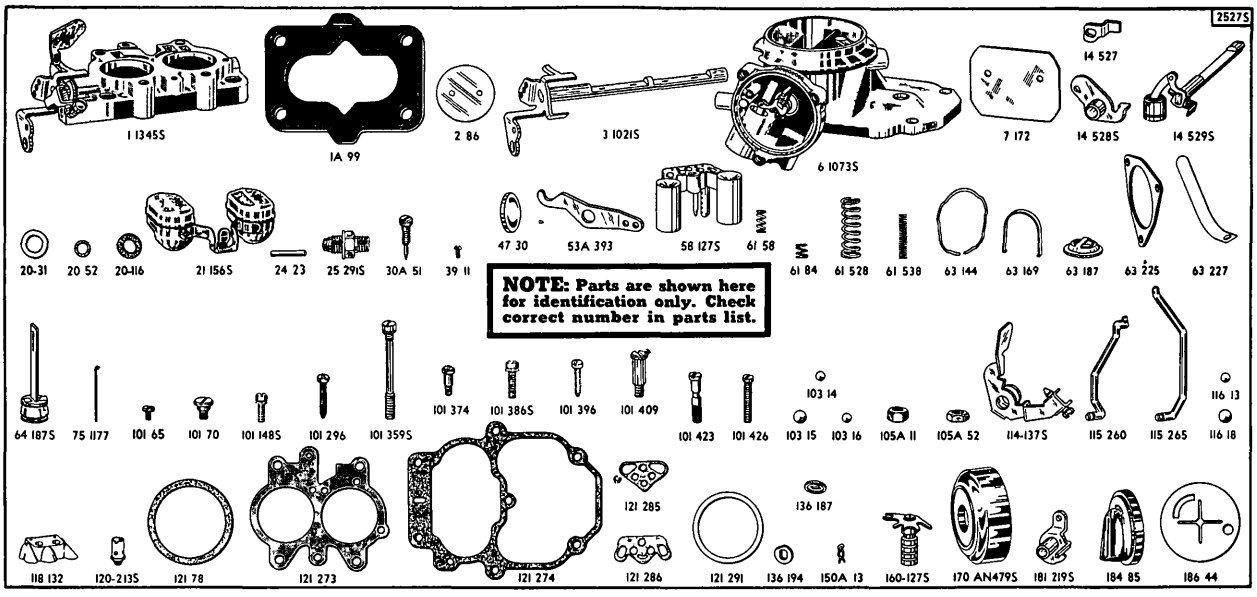
Float Level 9/32" (gauge T109 239) between top of each float ridge (at center of float) and top surface of body casting
To adjust bend lip on float arm

Pump 1 1/32" from the top of the bowl cover to the top of the plunger shaft Install throttle connector rod in center hole (medium stroke) of throttle leve and inner hole of pump arm
To adjust bend throttle connector rod

Fast Idle Cam Clearance With choke valve closed and lip on inner choke shaft lever contacting lug on outer lever align index mark on cam with adjusting screw
To adjust bend lip on inner choke shaft lever

Fast Idle Throttle Valve Clearance 015" (gauge T109 44) be tween lower edge of valve and bore with adjusting screw on high step of cam

Fast Idle on Car 1300 to 1350 R P M



Unloader 3/16" (gauge T109 28) between top edge of choke valve and inner wall of air horn with throttle valves wide open

To adjust bend unloader arm on throttle lever

WHEN SERVICING, USE GASKET ASSORTMENT No. 298; REPAIR PACKAGE No. 1858

PART NAMES IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No	PART NAME	
1-1345S	Body flange assembly	
1A 99	FLANGE GASKET	
2-86	Throttle valve	(2)
3-1021S	Throttle shaft and lever assembly	
6-1073S	Air horn assembly	
7-172	Choke valve	
14-527	Choke shaft lever	
14-528S	Choke lever assembly	
14-529S	Choke piston lever link and shaft assembly	
20-31	Needle seat gasket	
20-52	STEP UP PISTON GASKET	
20-116	Main metering jet gasket	(2)
21-156S	Float and lever assembly	
24-23	Float lever pin	
25-291S	NEEDLE AND SEAT ASSEMBLY	
30A-51	Idle adjustment screw	(2)
39-11	Choke and throttle valve attaching screw	(6)
47-30	Welsh plug	
53A-393	Pump arm	
58-127S	—Venturi cluster and nozzle assembly	
61-58	Throttle adjusting screw spring	
61-84	Idle adjustment screw spring	(2)
61-528	PUMP SPRING	
61-538	STEP UP PISTON SPRING	
63-144	Delayer plate retainer ring	
63-169	FLOAT LEVER PIN RETAINER	
63-187	INTAKE CHECK BALL RETAINER	
63-225	—Coil housing retainer	
63-227	—Heat tube retainer	
64-187S	PUMP PLUNGER AND ROD ASSEMBLY	
75-1177	Step up rod 026" (Sup by 75 1370)	(2)
75-1370	—Step up rod 028"	
101-65	Choke lever attaching screw	
101-70	Pump arm screw	
101-148S	Air horn attaching screw and washer assembly	(4)
101-296	Throttle adjusting screw	

Part No.	PART NAME	
101-359S	Body attaching screw and washer assembly	(2)
101-374	Step up piston plate guide screw	
101-386S	Body flange attaching screw and washer assembly	(2)
101-396	Fast idle adjusting screw	
101-409	Fast idle cam attaching screw	
101-423	—Venturi cluster screw	(2)
101-426	—Coil housing attaching screw	(3)
103-14	Lead shot	
103-15	Lead shot	(2)
103-16	Lead shot	(2)
105A-11	Flange stud nut	(4)
114-137S	Dash pot lever assembly	
115-260	Choke connector rod	
115-265	Throttle connector rod	
116-13	DISCHARGE CHECK BALL	
116-18	INTAKE CHECK BALL	
118-132	—Venturi cover	
120-212S	Main metering jet assembly 317 to 323 cc 2 sizes lean	(2)
120-213S	MAIN METERING JET ASSEMBLY 337 to 343 cc 1 size lean	(2)
120-214S	MAIN METERING JET ASSEMBLY 356 to 364 cc Standard	(2)
121-78	COIL HOUSING GASKET	
121-273	BODY FLANGE GASKET	
121-274	BODY GASKET	
121-285	—VENTURI HOUSING GASKET	
121-286	—VENTURI COVER GASKET	
121-291	—HEAT TUBE CAP GASKET	
136-187	Pump spring retainer washer	
136-194	Choke shaft washer	
150A-13	PIN SPRING	(3)
160-127S	STEP UP PISTON AND PLATE ASSEMBLY	
170AN479S	—Thermostatic coil and housing assembly	
181-219S	Fast idle cam assembly	
184-85	—Choke heat tube cap	
186-44	Choke baffle plate	

—Parts so marked are new and listed for the first time

NOTE Figures in parentheses indicate number of pieces used in one carbureter **Where no figure is shown, only one is used.**

CHRYSLER "V-8" MARINE

MODEL M-45S

1956

Two Carbureters Per Engine

BBS DOWN-DRAFT **CARBURETER No. 2360S**

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder Engine: 3.81 Inch Bore, 3.63 Inch Stroke

Dimensions: Flange size 1½ inch S A E

Throttle bore, 1-11/16 inch
Main venturi, 1-11/32 inch I D.

Vents. Outside none Inside, balance vent tube

Gasoline Intake. Size No 38 (1015 inch) drill in needle seat

Idle Tube: Jet size 0315 inch diameter Idle passage air bleed in body size No 68 (031 inch) drill Restriction in body 0394 inch diameter

Idle Port. Upper slot type length 149 inch; width 030 inch

Idle Port Opening: Top of port located 118 to 122 inch above top edge of valve, with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size 053 to 057 inch diameter.

Set Idle Adjustment Screw. ½ to 1½ turns open For richer mixture turn screw out Idle engine between 450 500 r p m

Main Metering Jet· Calibrated to flow 457 cc per minute (Do not gauge for size, if in doubt replace with new part)

Main Vent Tube. Side holes 6—0354 inch diameter Bleed in top of tube 0315 inch diameter

Step-Up Rod· (Vacuum operated) 026 inch diameter

Accelerating Pump Pump intake passage ball check seat size 115 to 120 inch diameter
Pump discharge passage restriction (under ball check) size 115 to 120 inch diameter in body
Pump (discharge) jet size 0393 inch drill

Choke. Manual—butterfly type offset valve

Vacuum Spark Port: None

Motor Tune-Up—Be Accurate!

CAUTION· Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open 4° B. T. D. C. At Vibration Damper	Valve Setting (Hot) Intake .008" Exhaust .020"	Float Setting 7/32 Inch (Use Gauge T109-239)	Idle Adjustment Screw Setting ½ to 1½ Turns Open Idle Engine at 450-500 R.P.M. In Neutral

FLOAT ADJUSTMENT This adjustment must be made with the bowl cover gasket and float pin retainer removed Hold the lip on float arm against the seated intake needle making sure the float pin is at the bottom of its guide slots The distance from the top surface of the body casting to the top of each float should be 7/32 inch (gauge T109 239) If one float is lower than the other equalize by bending the float arm If both floats require the same correction adjust by bending lip on float arm The floats must not rub anywhere against the inner walls of the bowl If necessary bend float arm slightly to provide clearance on all sides of floats

PUMP ADJUSTMENT Back out throttle adjusting screw and open choke valve so that throttle valve seats in bore of carbureter Install throttle connector rod in outer hole (long stroke) of throttle lever The distance from the top of the bowl cover to the top of the plunger shaft (not pump arm) should be 54/64 inch Adjust by bending pump connector rod at lower angle (use tool T109 213)

TWO CARBURETERS PER ENGINE

BBS DOWN-DRAFT CLIMATIC® CONTROL **CARBURETER No. 2478S**

CARBURETER SPECIFICATIONS

For Chrysler Ind. Eight Cylinder Engine: 3.81 Inch Bore, 3.63 Inch Stroke

Dimensions: Flange size 1½ inch S A E
Throttle bore, 1-11/16 inch
Main venturi, 1-11/32 inch I D

Float Setting: See adjustments

Vents: Outside, none Inside, balance vent tube

Gasoline Intake: Size No 44 (.086 inch) drill in needle seat

Idle Tube: Jet, size 0354 inch diameter Idle passage air bleed in body size 061 inch drill Restriction in body size 057 inch diameter.

Idle Port. Upper, slot type, length 195 inch width 030 inch

Idle Port Opening. Top of port located 140 to 144 inch above top edge of valve, with valve tightly closed

Lower Port (For Idle Adjustment Screw) Size, 053 to 057 inch diameter

Set Idle Adjustment Screw: ¾ to 1¾ turns open For richer mixture turn screw out Idle engine between 450 500 r p m gear shift lever in neutral

Main Metering Jet. Calibrated to flow 453 cc per minute (Do not gauge for size if in doubt, replace with new part)

Main Vent Tube. Side holes, 6—0354 inch diameter Bleed in top of tube 0315 inch diameter

Step-Up Rod. (Vacuum operated) size, 027 inch diameter

Accelerating Pump Pump intake passage, ball check seat, size 110 to 120 inch diameter
Pump discharge passage, ball check seat 110 to 120 inch diameter in body
Pump (discharge) jet size 0276 inch drill
Bleed hole in pump plunger, size 063 inch diameter

Pump Adjustment· See adjustments

Choke. Carter Climatic® Control set on index Choke heat suction hole in body size No 38 (.1015 inch) drill NOTE Thermostatic coil should not be removed from delayer mounting post If defective replace with complete thermostatic coil and housing assembly

Vacuum Spark Port Slot (round end) type Size 030 by 110 inch Top of port 044 to 050 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open: 8° B. T. C. At Vibration Damper	Float Setting (See Adjustments)	Idle Adjustment Screw Setting ¾ to 1¾ Turns Open Idle engine at 450 to 500 R.P.M.

NOTE: These engines are equipped with hydraulic valve lifters. NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: This adjustment must be made with the bowl cover gasket and float pin retainer removed Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots The distance from the top surface of the body casting to the top of each float should be 7/32 inch (gauge T109-239) If one float is lower than the other, equalize by bending the float arm If both floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywhere against the inner walls of the bowl If necessary, bend float arms slightly to provide clearance on all sides of floats

PUMP ADJUSTMENT· Back out throttle adjusting screw and open choke valve so that throttle valve seats in bore of carbureter Install throttle connector rod in center hole of throttle lever The distance from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 54/64 inch. Adjust by bending throttle connector rod at lower angle (use tool T109-213)

CARBURETER
TRADE MARK REG U. S. PAT. OFF.
MARCA REGISTRADA

S S PRINTED IN U.S.A.

FAST IDLE ADJUSTMENT Remove thermostatic coil housing assembly, gasket and baffle plate With throttle adjusting screw backed out, crack throttle valve and hold choke valve in fully closed position Then close throttle This will allow fast idle cam to revolve to fast idle position There should now be 016- 020 inch clearance (use gauge T109-44) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle (use tool T109-213)

UNLOADER ADJUSTMENT This adjustment must be made after the fast idle adjustment Hold throttle valve wide open and close choke valve as far as possible without forcing There should now be 9/64 inch clearance (use gauge T109-34) between upper edge of choke valve and inner wall of air horn Adjust by bending arm on choke trip lever (use tool T109-214) When fast idle and unloader adjustments have been made assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn Set Climatic® Control as specified making sure that hook on coil has picked up coil shaft lever

CHRYSLER MARINE "V-8" – 1956

Model M-45 Special

(Two Carbureters Per Engine)

WCFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2365S**

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder Engine 3 81 Inch Bore, 3 63 Inch Stroke

Dimensions Flange size 1⅛ inch Four Bore—4 Bolt type
Primary venturi size 11/32 inch I D
Main venturi size 1 1/16 inch I D

Vents Inside (5) Outside None

Gasoline Intake Size No 42 (0935 inch) drill in needle seat

Low Speed Jet Tube Jet primary and secondary size No 69 (0293 inch) drill By pass in body size primary No 52 (0635 inch) drill secondary (057 inch) diameter Econ omizer plug in body size (0452 inch) diameter Idle bleed n body size primary (059 inch) diameter secondary No 44, (086 inch) drill

Idle Port Upper slot type primary length 175 inch width 030 inch Secondary length 103 inch width 030 inch

Idle Port Opening Primary 116 to 122 inch secondary 059 to 065 inch above top edge of valve with valve tightly closed

Lower Port Primary (for idle adjustment screw) size No 55 (052 inch) drill
Secondary (no idle adjustment screw) s ze No 57 (043 inch) drill

Set Idle Adjustment Screw ¼ to 1¼ turns open For richer mixture turn screw out Do not idle engine below 450 500 R P M

Main Nozzle Installed permanently DO NOT REMOVE Anti percolating jet (4) size No 70 (028 inch) drill

Metering Rod Primary Economy step 073 inch d ameter
Middle step tapers to 062 inch diameter
Power step 048 inch diameter
Secondary none

Metering Rod Jet Primary size 089 inch diameter
Secondary size 053 inch diameter

Accelerating Pump Discharge jet (twin) primary side only size No 74 (0225 inch) drill Intake ball check seat size 115 to 120 inch diameter Discharge needle seat size No 50 (070 inch) drill Relief passage (vent) to fuel chamber s ze No 42 (0935 inch) drill

Choke Manual Butterfly type offset choke valve primary side only

Vacuum Spark Port None

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

Spark Plug Gap	Set Breaker Points	Ignition Timing Breaker Points to Open	Set Valves (Hot)	Float Setting	Idle Adjustment Screw Setting
.035"	017"	2° B T C	Intake 015" Exhaust 026"	Primary ⅛ Inch (Gauge T109-232) Secondary 3/16 Inch (Gauge T109-222)	¼ to 1¼ Turns Open 450 to 500 R.P.M.

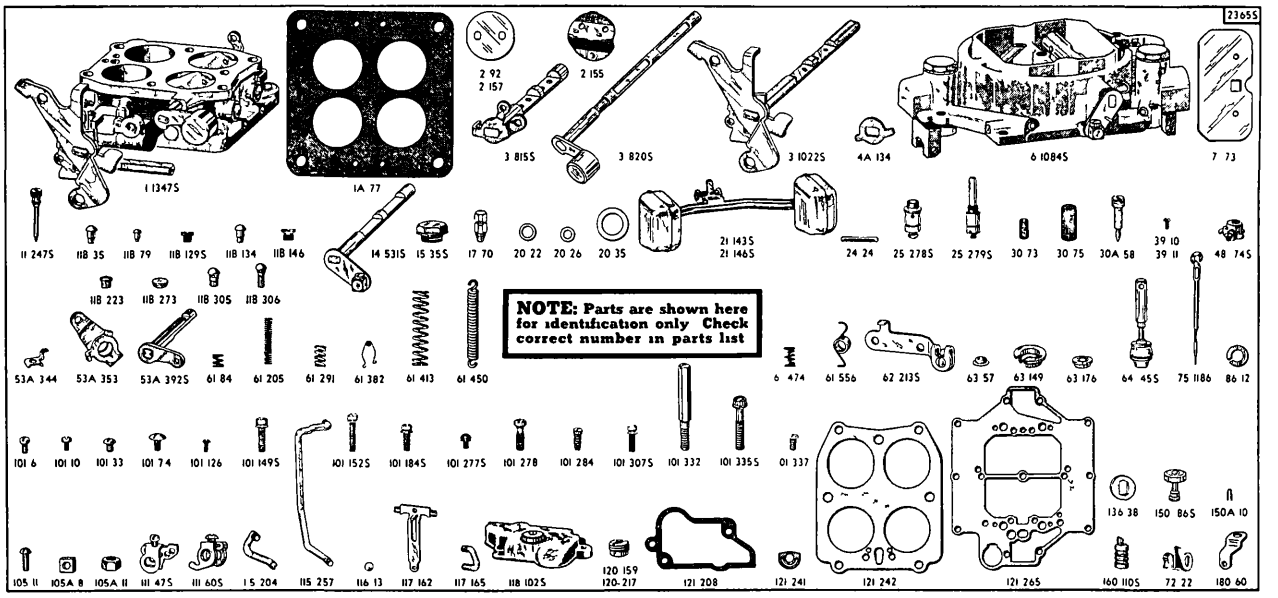
CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vertical **LATERAL ADJUST MENT** With bowl cover assembly inverted bowl cover gas ket removed and float resting on seated needle place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge Adjustment should be made by bending arms of floats **VERTICAL ADJUST MENT** With float gauge in same position floats should just clear the horizontal portion of gauge Vertical distance be tween top of float and machined surface of casting must be ⅛ inch (gauge 1109 232) for primary floats and 3/16 inch (gauge T109 222) for secondary floats Adjust by bending float arms

FLOAT DROP ADJUSTMENT With bowl cover held in up right position and measuring from center of floats the dis tance between top of floats and bowl cover should be ⅝ inch for primary floats and 11/16 inch for secondary floats Adjust by bending stop tabs on float bracket

PUMP ADJUSTMENT Install pump connector link in outer hole (long stroke) of pump arm with ends extending toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at upper angle (Use tool T109 213)

METERING ROD ADJUSTMENT Metering rod adjustment is important and must be made after completing the pump adjustment No metering rod gauges are necessary Pro cedure is as follows 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in down ward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw



BOWL VAPOR VENT ADJUSTMENT This adjustment should be made after completing pump and metering rod adjustments Install dust cover and dust cover gasket Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter There should be 1/16 inch (gauge T109 197) between lower edge of bowl vapor vent and dust cover To adjust remove dust cover and bend vapor vent arm

CHRYSLER "V-8" 1956

WCFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2367S-2367SA**

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder Engine 3 81 Inch Bore, 3.63 Inch Stroke

Dimensions Flange size 1¼ inch Four Bore—4 bolt type
Primary venturi size 11/32 inch I D
Main venturi size 1 3/16 inch I D

Vents Outside (4) Inside (5)

Gasoline Intake Size No 42 (0935 inch) drill hole in needle seat

Low Speed Jet Tube Jet (4) size 035 inch diameter
By Pass in body (4) size No 52 (0635 inch) drill
Economizer (4) size 0452 inch diameter
Idle bleed (4) in body size No 52 (0635 inch) drill

Idle Port Upper slot type Primary length 175 inch width 030 inch Secondary length 101 inch width 030 inch

Idle Port Opening Primary 130 to 134 inch above top edge of valve with valve tightly closed Secondary 071 to 077 inch

Lower Port Primary (for idle adjustment screw) size No 53 (0595 inch) drill Secondary constant feed size 040 inch diameter

Set Idle Adjustment Screw ¾ to 1¾ turns open For richer mixture turn screw out Do not idle engine below 500 R P M in neutral

Main Nozzle Installed permanently DO NOT REMOVE Anti-percolating jet (to nozzle well) primary side (to idle well) secondary side size No 70 (028 inch) drill

Metering Rod Primary economy step 075 inch diameter Middle step tapers to 065 inch diameter Power step 042 inch diameter Secondary none

Metering Rod Jet Primary size 096 inch diameter (for metering rod)
Secondary size 055 inch diameter (no metering rod)

Accelerating Pump Discharge jet (twin) primary side only size No 74 (0225 inch) drill
Intake ball check seat size 115 to 120 inch diameter
Discharge needle seat size 070 inch diameter
Relief passage (vent) to fuel chamber No 42 (0935 inch) drill
Discharge relief plug size No 55 (052 inch) drill

Choke Carter Climatic® Control set one point rich Butterfly type offset choke valve primary side only Choke heat suction hole restriction in piston housing size No 47 (0785 inch) drill

Vacuum Spark Port Horizontal slot (round end) 045 by 110 inch Top of port 032 to 042 inch above valve with valve tightly closed

Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

Spark Plug Gap .035"	Breaker Point Setting 017"	Ignition Timing Breaker Points to Open 4° B T C At Vibration Damper	Float Setting Primary 1/8 Inch (Use Gauge T109-232) Secondary 3/16 Inch (Use Gauge T109-222)	Idle Adjustment Screw Setting ¾ to 1¾ Turns Open Idle Engine at 500 R P M. In Neutral

NOTE These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT

CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

S S PRINTED IN U S A

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vertical **Lateral Adjustment** Side of floats should just clear the vertical uprights of float gauge Adjustment should be made by bending arms of floats **Vertical Adjustment** With bowl gasket removed vertical distance between top of float and machined surface of casting must be 5/32 inch (gauge T109 236) for primary floats and 7/32 inch (gauge T109 283) for secondary floats Adjust by bending float arms

FLOAT DROP ADJUSTMENT With bowl cover held in upright position and measuring from center of floats the distance between top of floats and bowl cover should be 21/32 inch for primary floats and 23/32 inch for secondary floats Adjust by bending stop tabs on float bracket

PUMP ADJUSTMENT Install pump connector link in outer hole (long stroke) of pump arm with ends extending outward toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109 213)

METERING ROD ADJUSTMENT Metering rod adjustment must be made after pump adjustment 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

BOWL VAPOR VENT ADJUSTMENT This adjustment should be made after completing pump and metering rod adjustments Install dust cover and dust cover gasket Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter There should be 1/16 inch (gauge T109 197) between lower edge of bowl vapor vent valve and dust cover To adjust remove dust cover and bend vapor vent arm

FAST IDLE ADJUSTMENT (a) Loosen choke lever clamp screw on choke shaft Insert 020 inch wire gauge (T109 29) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (b) With choke valve tightly closed tighten fast idle adjusting screw until there is 012 inch (gauge T109 200) opening between throttle valve and bore of carbureter side opposite idle port Be sure fast idle adjusting screw is on high step of cam while making this adjustment

UNLOADER ADJUSTMENT With throttle wide open there should be 3/16 inch (gauge T109 28) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109 41)

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT This adjustment should be made after completing fast idle adjustment Crack throttle valves and hold choke valve tightly closed Then close throttle Tang on secondary throttle lever should freely engage in notch of lock out dog If necessary to adjust bend tang on secondary throttle lever

PRIMARY THROTTLE SHAFT DOG ADJUSTMENT

Block choke valve wide open

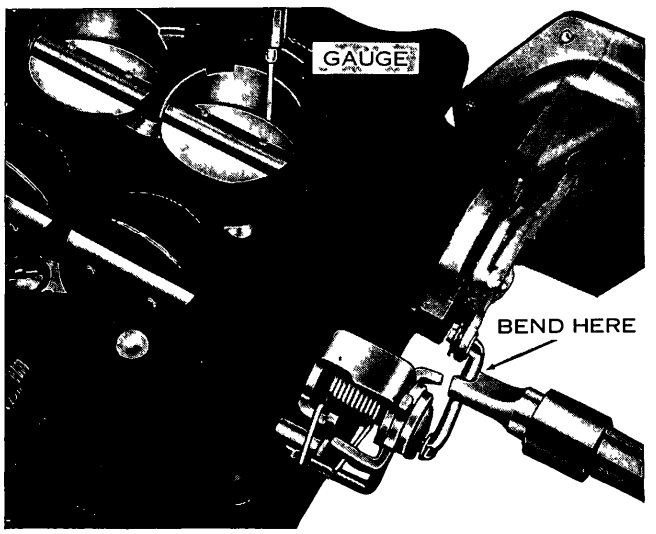

Figure 1

With primary throttle valves in wide open position adjust (use tool T109 213) secondary operating rod so there is 054" to 064" clearance (gauge T109 193) between upper edge of secondary throttle valves (next to idle port) and bore of carbureter (Fig 1)

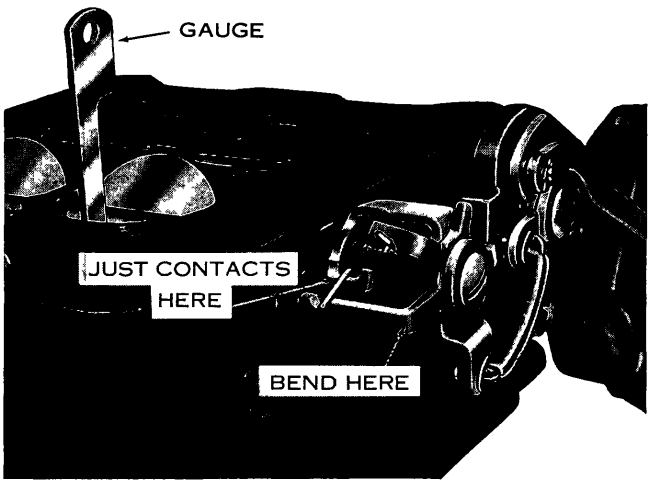

Figure 2

Place 1/4" gauge (tool T109 31) between upper edge of primary throttle valve and bore (next to idle port) and adjust (use tool T109 214) long tang on primary throttle shaft dog so that inner arm of spring just contacts inner lug of secondary operating lever and secondary throttle valves just start to open (Fig 2)

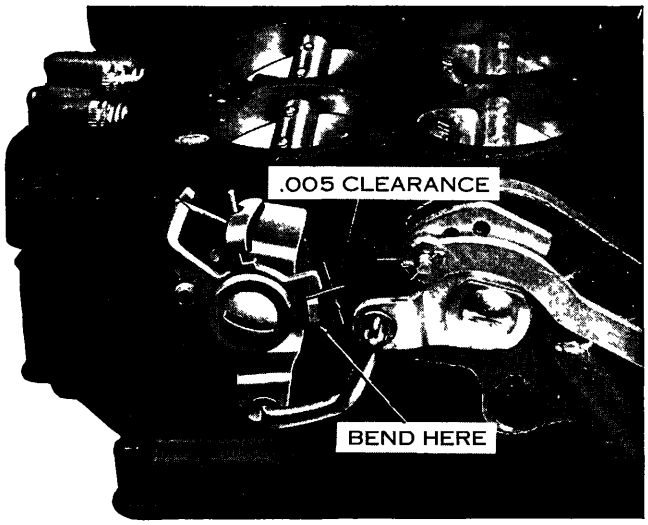

Figure 3

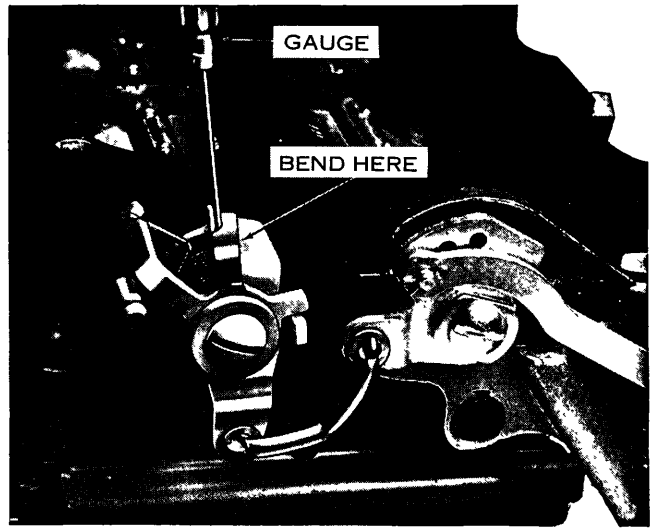
With primary and secondary throttle valves tightly seated, there should be .005" clearance (gauge T109-237) between outer lip on secondary operating lever and stop lug on primary throttle shaft dog.

TO ADJUST: Bend outer lip on secondary operating lever (use tool T109-214).

CAUTION: After bending, be sure secondary operating lever operates freely and does not bind in any position (Fig. 3).



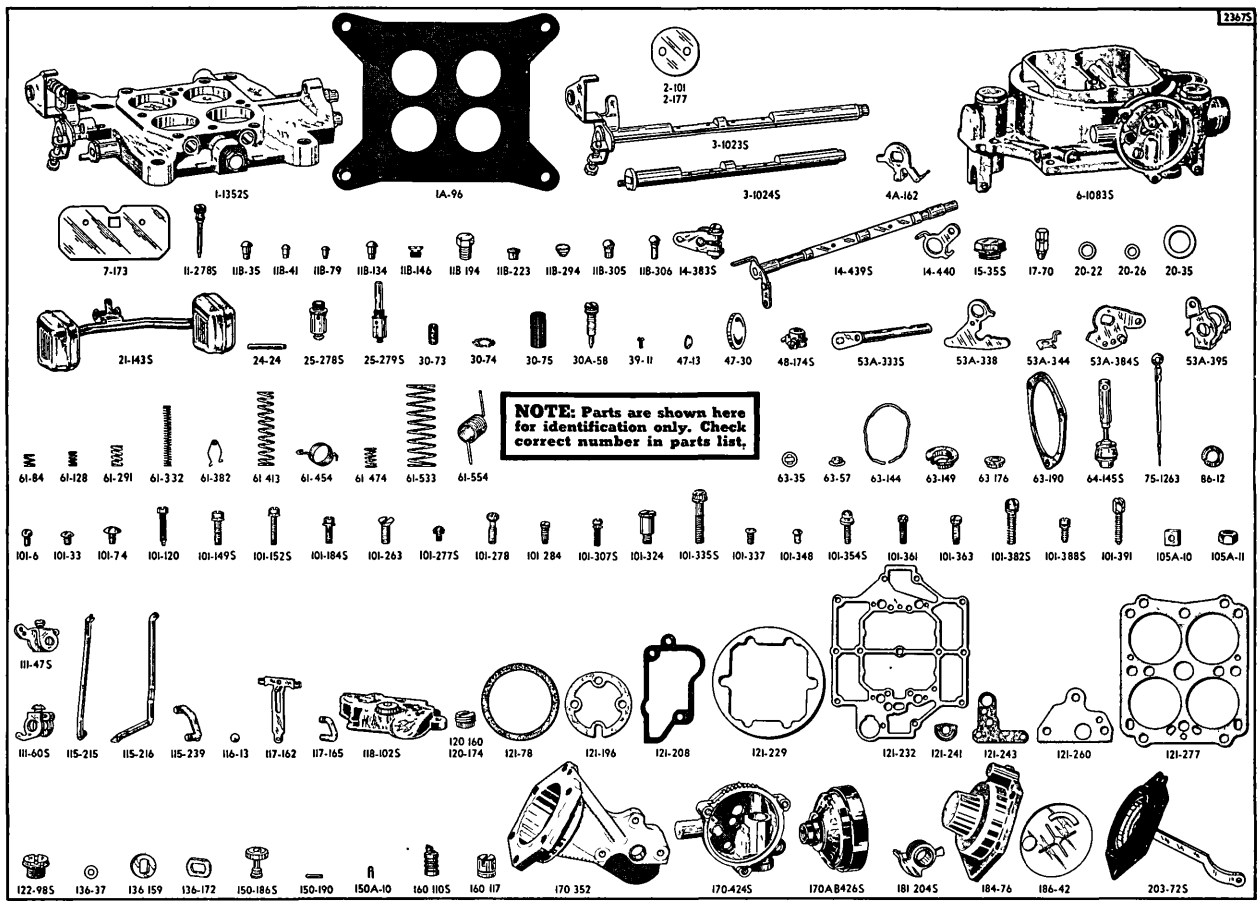


Figure 4

With primary and secondary throttle valves tightly closed, there should be .040" clearance (gauge T109-193) between short tang on primary throttle shaft dog and outer arm of spring.

TO ADJUST: Bend short tang on primary throttle shaft dog (use tool T109-214) (Fig. 4).

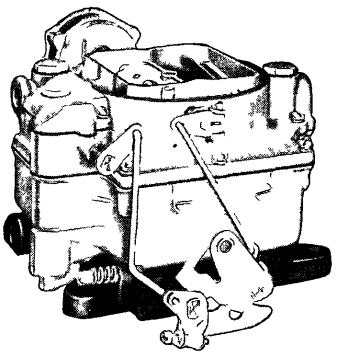
WHEN SERVICING, USE GASKET ASSORTMENT No. 282A; REPAIR PACKAGE No 1833A



PART NAMES IN CAPITAL LETTERS LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No.	PART NAME	
1-1352S	—Body flange assembly	
1A-96	Flange gasket (Sup by 1A 103)	
1A-103	FLANGE GASKET	
2-101	Primary throttle valve	(2)
2-177	—Secondary throttle valve	(2)
3-1023S	—Primary throttle shaft and lever assembly	
3-1024S	—Secondary throttle shaft and dog assembly	
4A-162	—Primary throttle shaft dog	
6-1083S	—Air horn assembly (Casting No 6 1020)	
6-1174S	—Air horn assembly (Casting No 6 1147)	
7-173	Choke valve	
11-278S	—LOW SPEED JET ASSEMBLY	(4)
11B-35	Rivet plug	(4)
11B-41	Rivet plug (6 1083S (2), (6 1174S (1)	
11B-79	Rivet plug	(5)
11B-134	Rivet plug	
11B-146	Level sight plug	(2)
11B-194	Pipe plug	
11B-223	Nozzle passage rivet plug	(4)
11B-294	Idle port rivet plug	(4)
11B-305	Rivet plug (6 1083S (1) (6 1174S (2)	
11B-306	Rivet plug (6-1083S (2) (6 1174S (1)	
14-383S	Choke lever and screw assembly	
14-439S	Choke piston lever link and shaft assembly	
14-440	Cam trip lever	
15-35S	Strainer nut assembly	(2)
17-70	PUMP CHECK NEEDLE	
20-22	Needle seat gasket	(2)
20-26	Pump relief plug gasket	
20-35	BOWL STRAINER GASKET	(2)
21-143S	Float and lever assembly	(2)
24-24	Float lever pin	(2)
25-278S	PRIMARY NEEDLE AND SEAT ASSEMBLY	
25-279S	SECONDARY NEEDLE AND SEAT ASSEMBLY	
30-73	PRIMARY NEEDLE SEAT STRAINER	
30-74	SECONDARY FUEL INLET STRAINER	
30-75	BOWL STRAINER	
30A-58	Idle adjustment screw	(2)
39-11	Choke valve attaching screw	(2)
47-13	Welsh plug (spark port passage)	
47 30	Welsh plug (choke housing)	
48-174S	Pump jet and housing assembly	
53A-333S	Pump operating lever and countershaft assembly	
53A-338	Lockout arm	
53A-344	VENT ARM	
53A-384S	Secondary throttle operating lever assembly	
53A-395	—Primary throttle operating lever	
61-84	Idle adjustment screw spring	(2)
61-128	Connector rod spring	
61-291	Throttle adjusting screw spring	
61-332	VACUUM PISTON SPRING	
61-382	METERING ROD SPRING	
61-413	UPPER PUMP SPRING	
61-454	Fast idle cam spring	
61-474	Bowl vent spring	
61-533	Diaphragm return spring	
61-554	—Throttle flex spring	
63-35	Connector rod spring retainer	
63-57	INTAKE CHECK BALL RETAINER	
63-144	Delayer plate retainer ring	
63-149	Bowl vent spring retainer	
63-176	Pump spring retainer	
63-190	Coil housing retainer	
64-145S	PUMP PLUNGER AND ROD ASSEMBLY	
75-1180	Metering rod—1 size lean	(2)
75-1181	Metering rod—2 sizes lean	(2)
75-1210	—Metering rod—standard (2367S) (Sup by 75-1263)	(2)
75-1263	—METERING ROD—STANDARD	(2)
75-1278	—Metering rod—1 size rich	(2)
86-12	Flange stud lock washer	(4)
101-6	Pump arm clamp screw	
101-33	Metering rod arm clamp screw	
101-74	Throttle shaft screw	(2)
101-120	Fast idle adjustment screw	
101-149S	Body flange attaching screw and washer assembly	
101-152S	Air horn attaching screw and washer assembly	
101-184S	Dust cover attaching screw and washer assembly	(2)
101-263	Diaphragm housing attaching screw	(3)
101-275	Piston housing attaching screw (Use with 6 1174S)	
101-277S	Vent arm attaching screw and washer assembly	
101-278	Pump jet housing attaching screw	
101-284	Piston housing attaching screw (6 1083S)	(2)
101-307S	Air horn attaching screw and washer assembly	(8)
101-324	Fast idle cam attaching screw	
101-335S	Air horn attaching screw and washer assembly	(7)
101-337	Secondary throttle valve attaching screw	(4)
101-348	Primary throttle valve attaching screw	(4)
101-354S	Choke lever clamp screw assembly	
101-361	Coil housing attaching screw	(3)
101-363	Piston housing attaching screw (6 1083S (1), (6 1174S (2)	
101-382S	Body flange attaching screw and washer assembly	(3)
101-388S	Diaphragm housing cover attaching screw and washer assembly	(6)
101-391	Throttle lever adjusting screw	
105A-10	Choke lever clamp screw nut	
105A-11	Flange stud nut	(4)
111-47S	Pump arm and screw assembly	
111-60S	Metering rod arm and screw assembly	
115-215	Choke connector rod	
115-216	THROTTLE CONNECTOR ROD	
115-239	Throttle operating rod	
116-13	PUMP INTAKE CHECK BALL	
117-162	Vacumeter piston link	
117-165	Pump connector link	
118-102S	Dust cover assembly	
120-160	PRIMARY METERING ROD JET	(2)
120-174	SECONDARY METERING JET	(2)
121-78	COIL HOUSING GASKET	
121-196	Delayer plate gasket (2367S)	
121-208	DUST COVER GASKET	
121-229	AIR CLEANER GASKET	
121-232	AIR HORN GASKET	
121-241	PUMP JET HOUSING GASKET	
121-243	PISTON HOUSING GASKET (Use with 6 1083S)	
121-256	Body flange gasket (Sup by 121 277)	
121-260	DIAPHRAGM HOUSING GASKET	
121-277	—BODY FLANGE GASKET	
121-283	PISTON HOUSING GASKET (Use with 6 1174S)	
122-98S	PUMP RELIEF PLUG ASSEMBLY	
136-37	Throttle connector rod and operating rod washer	(5)
136-159	Primary throttle shaft washer	
136-172	Secondary throttle shaft washer	
150-186S	Pin and valve cap assembly	
150-190	Choke piston pin	
150A-10	PIN SPRING	(5)
160-110S	Vacuum piston and pin assembly	
160-117	Choke piston	
170-301S	Piston housing and plug assembly (2367S) (Sup by 170 424S)	
170-352	Diaphragm housing	
170-424S	—Piston housing and plug assembly (Use with 6 1083S)	
170-443S	—Piston housing and plug assembly (Use with 6-1174S)	
170AB323S	Thermostatic coil and housing assembly (2367S) (Sup by 170AB 426S)	
170AB-426S	—Thermostatic coil and housing assembly	
181-204S	Fast idle cam assembly	
184-76	Diaphragm housing cap	
186-42	Choke baffle plate	
203-72S	Secondary throttle shaft diaphragm assembly	

—Parts so marked are new and listed for the first time

WCFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2314S-2314SA**

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder Engine 3 94 Inch Bore, 3.63 Inch Stroke

Dimensions Flange size 1¼ inch Four Bore—4 bolt type
Primary venturi size 11/32 inch I D
Main venturi size 1 3/16 inch I D

Vents Outside (4) Inside (5)

Gasoline Intake Size No 42 (0935 inch) drill hole in needle seat

Low Speed Jet Tube Jet (4) size 035 inch diameter
By Pass in body (4) size No 52 (0635 inch) drill
Economizer (4) size 0452 inch diameter
Idle bleed (4) in body size No 52 (0635 inch) drill

Idle Port Upper slot type Primary length 175 inch width 030 inch Secondary length 101 inch width 030 inch

Idle Port Opening Primary 130 to 134 inch above top edge of valve with valve tightly closed Secondary 071 to 077 inch

Lower Port Primary (for idle adjustment screw) size No 53 (0595 inch) drill Secondary constant feed size 040 inch diameter

Set Idle Adjustment Screw 1 to 2 turns open For richer mixture turn screw out Do not idle engine below 500 R P M in neutral

Main Nozzle Installed permanently DO NOT REMOVE Anti-percolating jet (to nozzle well) primary side (to idle well) secondary side size No 70 (028 inch) drill

Metering Rod Primary economy step 075 inch diameter Middle step tapers to 065 inch diameter Power step 042 inch diameter Secondary none

Metering Rod Jet Primary size 096 inch diameter (for metering rod)
Secondary size 061 inch diameter (no metering rod)

Accelerating Pump Discharge jet (twin) primary side only size No 74 (0225 inch) drill
Intake ball check seat size 115 to 120 inch diameter
Discharge needle seat size 070 inch diameter
Relief passage (vent) to fuel chamber No 42 (0935 inch) drill
Discharge relief plug size No 55 (052 inch) drill

Choke Carter Climatic® Control set one point rich Butterfly type offset choke valve primary side only Choke heat suction hole restriction in piston housing size No 47 (0785 inch) drill

Vacuum Spark Port Horizontal slot (round end) 045 by 110 inch Top of port 032 to 042 inch above valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION **Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.**

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open 4° B T C At Vibration Damper	Float Setting Primary 5/32 Inch (Use Gauge T109-236) Secondary 7/32 Inch (Use Gauge T109-283)	Idle Adjustment Screw Setting 1 to 2 Turns Open Idle Engine at 500 R P M In Neutral

S S PRINTED IN U S A

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vertical **Lateral Adjustment** Side of floats should just clear the vertical uprights of float gauge Adjustment should be made by bending arms of floats **Vertical Adjustment** With bowl gasket removed vertical distance between top of float and machined surface of casting must be 5/32 inch (gauge T109 236) for primary floats and 7/32 inch (gauge T109 283) for secondary floats Adjust by bending float arms

FLOAT DROP ADJUSTMENT With bowl cover held in upright position and measuring from center of floats the distance between top of floats and bowl cover should be 21/32 inch for primary floats and 23/32 inch for secondary floats Adjust by bending stop tabs on float bracket

PUMP ADJUSTMENT Install pump connector link in outer hole (long stroke) of pump arm with ends extending outward toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109 213)

METERING ROD ADJUSTMENT Metering rod adjustment must be made after pump adjustment 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

BOWL VAPOR VENT ADJUSTMENT This adjustment should be made after completing pump and metering rod adjustments Install dust cover and dust cover gasket Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter There should be 1/16 inch (gauge T109 197) between lower edge of bowl vapor vent valve and dust cover To adjust remove dust cover and bend vapor vent arm

FAST IDLE ADJUSTMENT (a) Loosen choke lever clamp screw on choke shaft Insert 020 inch wire gauge (T109 29) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (b) With choke valve tightly closed tighten fast idle adjusting screw until there is 012 inch (gauge T109 200) opening between throttle valve and bore of carbureter side opposite idle port Be sure fast idle adjusting screw is on high step of cam while making this adjustment

UNLOADER ADJUSTMENT With throttle wide open there should be 3/16 inch (gauge T109 28) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle snaft lever (use bending tool T109 41)

SECONDARY THROTTLE LOCK OUT ADJUSTMENT This adjustment should be made after completing fast idle adjustment Crack throttle valves and hold choke valve tightly closed Then close throttle Tang on secondary throttle lever should freely engage in notch of lock out dog If necessary to adjust bend tang on secondary throttle lever

PRIMARY THROTTLE SHAFT DOG ADJUSTMENT

Block choke valve wide open

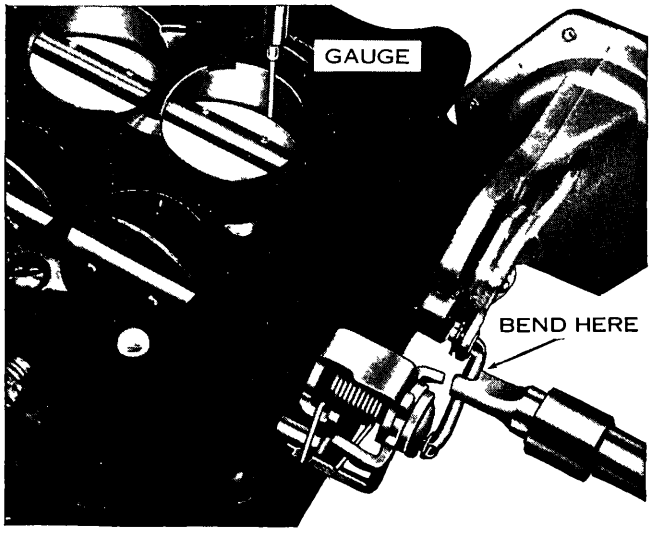

Figure 1

With primary throttle valves in wide open position adjust (use tool T109 213) secondary operating rod so there is 054" to 064" clearance (gauge T109 193) between upper edge of secondary throttle valves (next to idle port) and bore of carbureter (Fig 1)

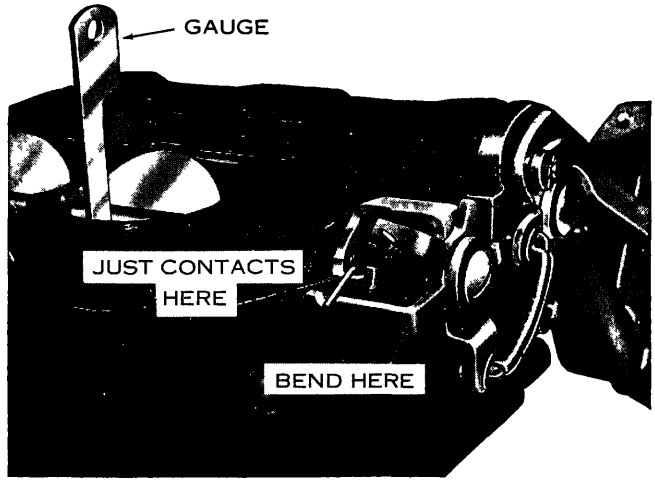

Figure 2

Place 1/4" gauge (tool T109 31) between upper edge of primary throttle valve and bore (next to idle port) and adjust (use tool T109 214) long tang on primary throttle shaft dog so that inner arm of spring just contacts inner lug of secondary operating lever and secondary throttle valves just start to open (Fig 2)

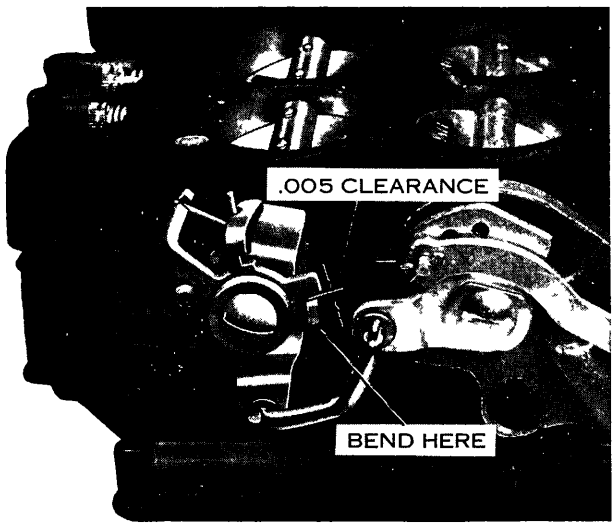

Figure 3

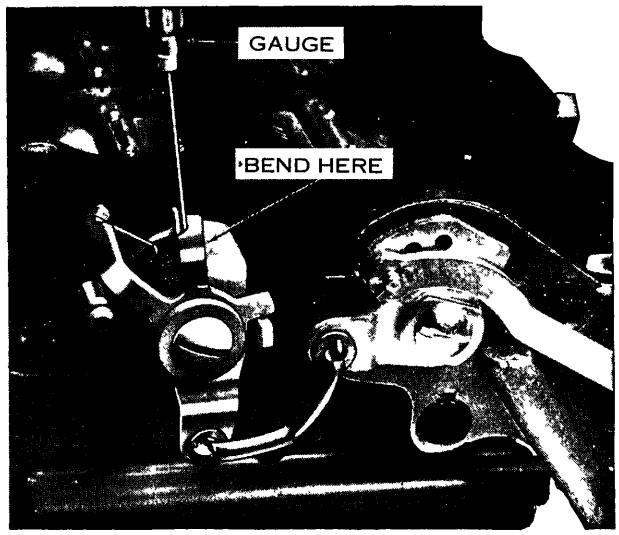
With primary and secondary throttle valves tightly seated, there should be 005" clearance (gauge T109-237) between outer lip on secondary operating lever and stop lug on primary throttle shaft dog

TO ADJUST Bend outer lip on secondary operating lever (use tool T109 214)

CAUTION After bending, be sure secondary operating lever operates freely and does not bind in any position (Fig 3)



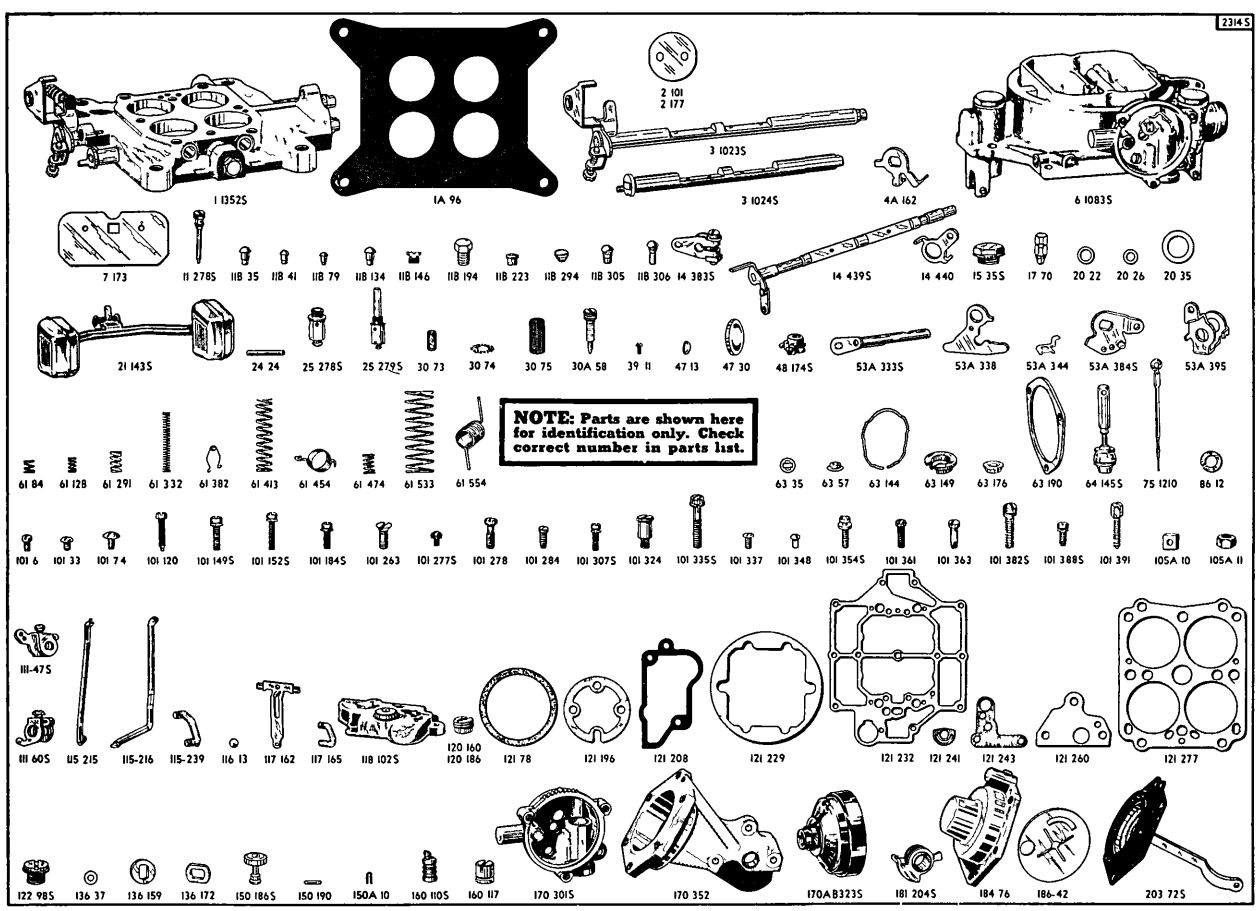


Figure 4

With primary and secondary throttle valves tightly closed, there should be 040" clearance (gauge T109-193) between short tang on primary throttle shaft dog and outer arm of spring

TO ADJUST Bend short tang on primary throttle shaft dog (use tool T109-214) (Fig 4)

BBD Dual Down-Draft Climatic® Control **Carbureters Nos. 2312S-2313S**

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder Engine 3 81 Inch Bore, 3.63 Inch Stroke

Dimensions: Flange size 1¼ inch dual 4 bolt type Throttle bore 1-7/16 inch I. D Primary venturi ⅜ inch I D Main venturi 1-3/16 inch I D

Float Level. See adjustments

Vent Inside balance vent tube to bowl in air horn above choke valve

Gasoline Intake Size No 38 (1015 inch) drill hole in needle seat

Idle Tube Jet size 035 inch diameter Idle bleed (in venturi cluster screw) size 063 inch diameter Idle restriction (in venturi cluster screw) size 0472 inch diameter

Idle Port Upper slot type length 190 inch; width 030 inch

Idle Port Opening 144 to 148 inch above upper edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size 053 to 057 inch diameter

Set Idle Adjustment Screw: ¼ to 1¼ turns open For richer mixture turn screw out With gear shift lever in neutral position idle engine between 450 and 500 RPM

Main Nozzle: Nozzle is installed permanently Do NOT REMOVE

Main Vent Tube. Side holes 8—size 0354 inch diameter Main vent in top of tube size 0256 inch diameter

Step-Up Rod (Vacuum operated) 024 inch diameter

Metering Jet Calibrated to flow 337 to 343 cc per minute (Do not gauge for size if in doubt replace with new part)

Accelerating Pump Pump discharge jets (2—in venturi cluster) size 0275 inch diameter Intake ball check seat size 135 to 140 inch diameter Discharge ball check seat size 110 to 120 inch diameter

Pump Adjustments See adjustments

Choke Carter Climatic® Control set (2312S) on index (2313S) one point rich Butterfly type offset valve Choke heat suction hole in body size No 54 (055 inch) drill NOTE Thermostatic coil should not be removed from delayer mounting post If defective replace with complete thermostatic coil and housing assembly

Vacuum Spark Port Horizontal round end type 030 by 110 inch Top of port to be 035 to 045 inch above upper edge of valve with valve closed tight

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open. 2° B. T. C. At Vibration Damper	Float Setting See Adjustments	Idle Adjustment Screw Setting ¼ to 1¼ Turns Open Idle Engine at 450 to 500 R.P.M.

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3655

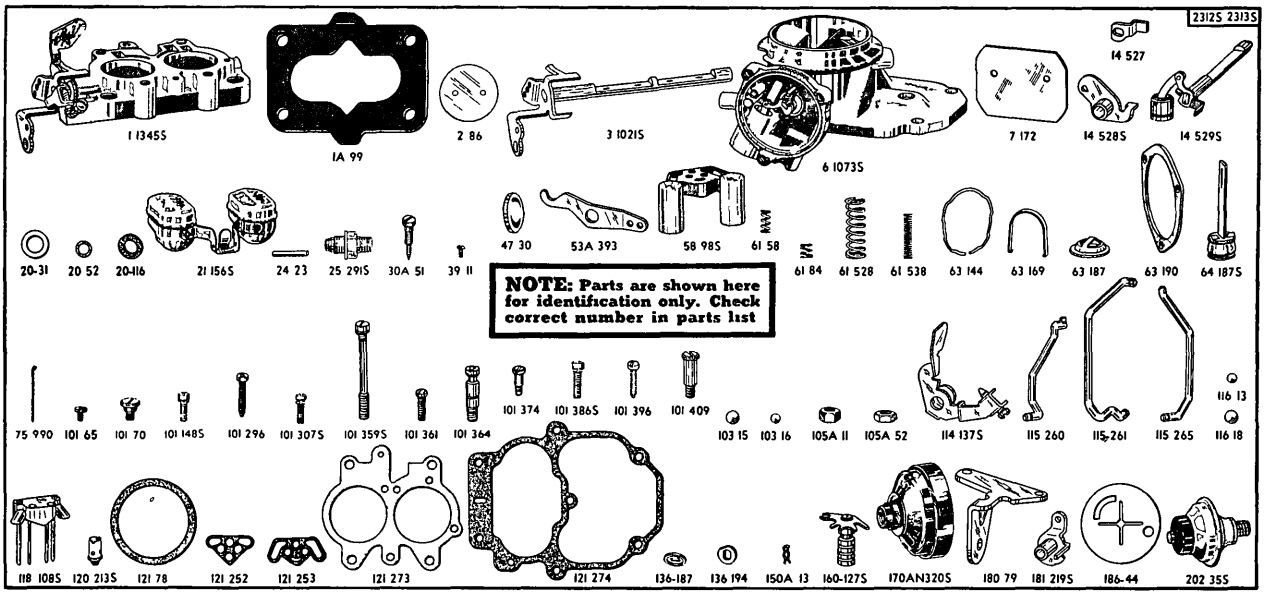
Float Level ¼" (Gauge T109 282) between top of each float and top surface of body casting
To adjust bend lip on float arm

Pump 31/32" from the top of the bowl cover to the top of the plunger shaft Install throttle connector rod in center hole (medium stroke) of throttle lever and inner hole of pump arm
To adjust bend throttle connector rod

Fast Idle Cam Clearance: With choke valve closed and lip on inner choke shaft lever contacting lug on outer lever there should be 020" (Gauge T109 29) between lip of fast idle cam and boss on casting Optional adjustment (late production) align index mark on cam with adjusting screw
To adjust bend lip on inner choke shaft lever

Fast Idle Throttle Valve Clearance 015" (Gauge T109 44) between lower edge of valve and bore with adjusting screw on high step of cam

Unloader 3/16" (Gauge T109 28) between top edge of choke valve and inner wall of air horn with throttle valves wide open



To adjust bend unloader arm on throttle lever

Dash Pot (Slow Closing Throttle): Close throttle valves and bottom plunger shaft with 1/16" gauge between shaft and operating lever

To adjust loosen lock nut and turn dash pot unit in or out

CARTER MODEL BBD CARBURETER FOR CHRYSLER (SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor Corporation, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the brass identification tag, when requesting specification pages.

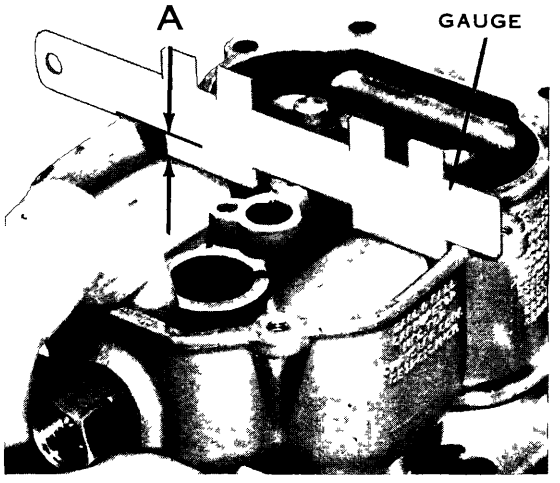

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

This adjustment must be made with the bowl cover gasket and float pin retainer removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots. The distance (A) from the top surface of the body casting to the top of each float should be as listed on carbureter specification page. If one float is lower than the other, equalize by bending the float arm. If both floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywhere against the inner walls of the bowl. If necessary, bend float arms slightly to provide clearance on all sides of floats.

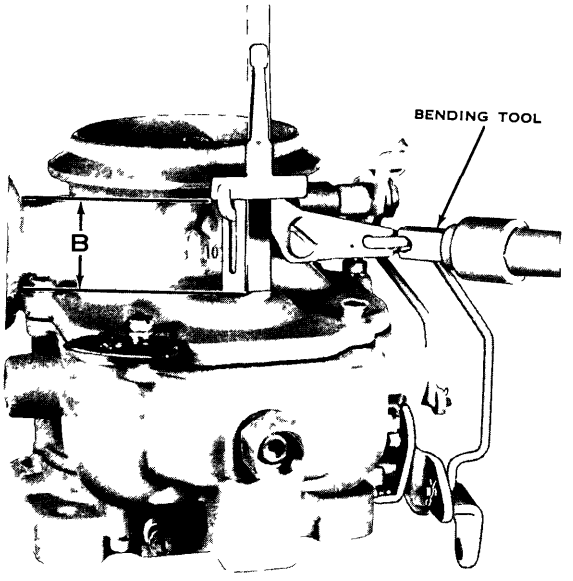

Figure 2
Pump Adjustment

PUMP ADJUSTMENT (Fig. 2):

1. Back out throttle adjustment screw and open choke valve so that throttle valves seat in bores of carbureter.
2. Install throttle connector rod in the holes in the throttle lever and pump arm specified on carbureter specification page.
3. The distance (B) from the top of the bowl cover to the top of the plunger shaft should be as specified on carburetor specification page.
4. Adjust by bending pump connector rod. (Use bending tool T109-213.)

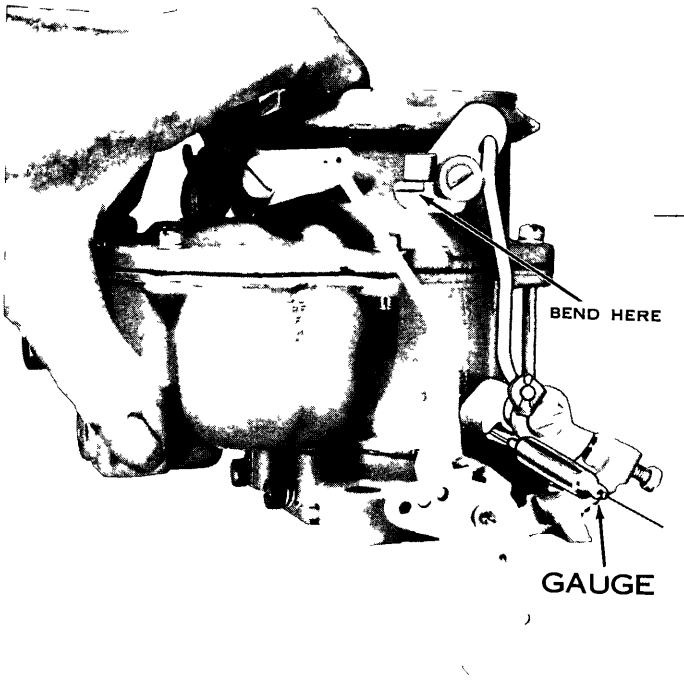

Figure 3
Fast Idle Adjustment

FAST IDLE CAM CLEARANCE ADJUSTMENT (Fig. 3):

1. Hold choke valve tightly closed.
2. With lip on inner choke shaft lever contacting lug on outer lever, there should be the clearance listed on carbureter specification page between lip of fast idle cam and boss on casting. Optional adjustment (late production), align index mark on cam with adjusting screw.
3. Adjust by bending lip on inner choke shaft lever. (Use bending tool T109-22.)

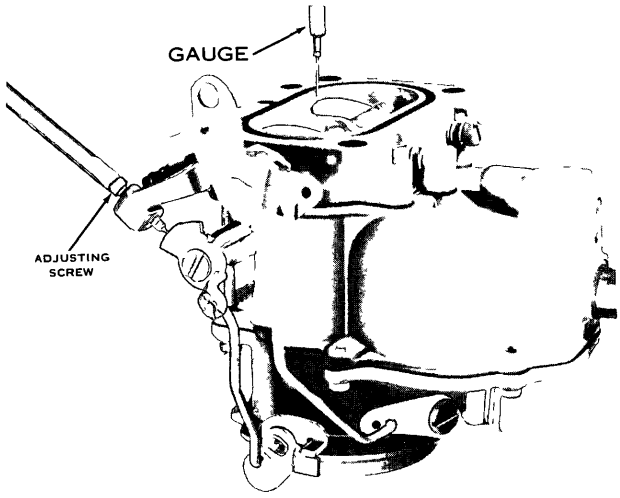

Figure 4
Fast Idle Adjustment

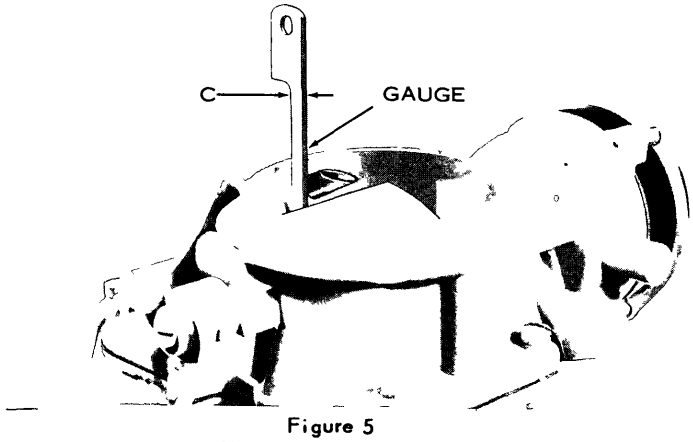

Figure 5
Unloader Adjustment

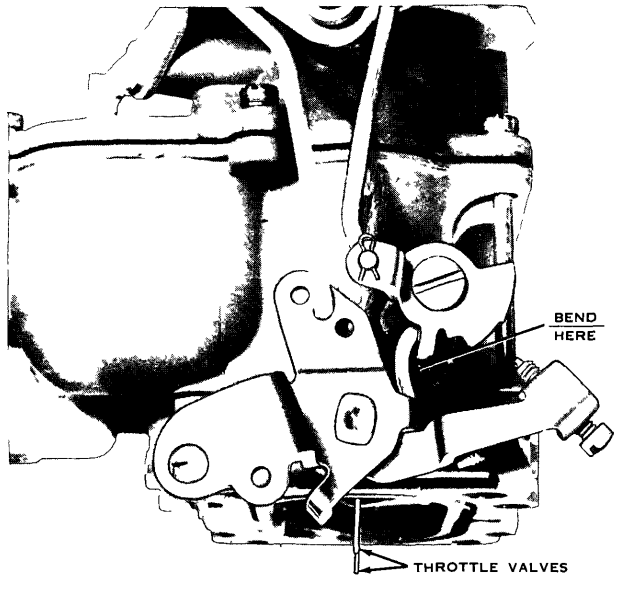

Figure 5A
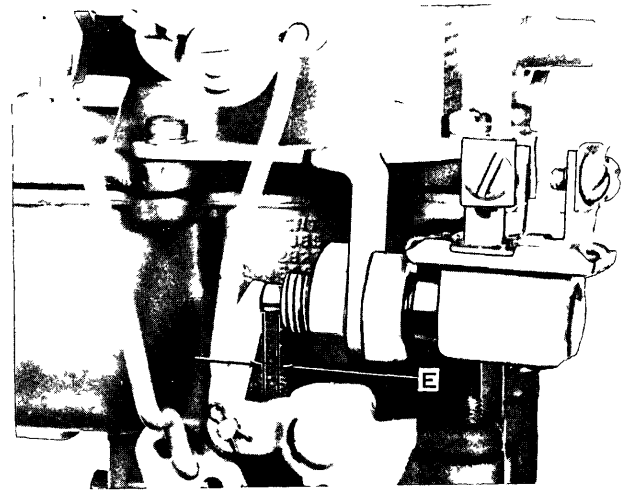
Unloader Adjustment

UNLOADER ADJUSTMENT (Figs. 5 & 5A):

1. H ld thr ttle valves wide pen.
2. Cl s ch k valv as far as p ssibl without forcing.
3. Cl aranc (C) b tw n t p dg f ch k valv and inn r wall f air h rn (Fig. 5) should b as list d n carbur t r sp cification pag .
4. Adiust by b nding chok unl ad r arm on thr ttl l v r (Fig. 5A). (Us bending tool T109-213.)

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 4):



1. B sur chok valv is cl s d.
2. Adjust fast idl adjusting scr w against high st p f cam until th cl aranc b tw en thr ttl valve (sid opposit port) and b re is as list d n carbur t r specificati n page

Figure 6
Dashpot Adjustment

DASH POT (SLOW CLOSING THROTTLE) ADJUSTMENT (Fig. 6):

The purpose of this unit is to prevent the car from stalling when the throttle is released rapidly. Maximum action is obtained by loosening lock nut and adjusting the dash pot unit so that the plunger shaft can be bottomed with a 1/16 inch gauge (D) placed between shaft and operating lever with throttle valves tightly closed.

Figur 7
Ov rdriv Kickdown Switch Adjustm nt

OVERDRIVE KICKDOWN SWITCH ADJUSTMENT (Fig. 7):

With thr ttl valves in wide p n p siti n, adjust h x nuts n switch t hav 1/64 inch t 3/64 inch cl aranc (E) b tw n kickdown l ver and switch stem guid .

MARINE

MODEL – ROYAL M-44

1955-1956

BBD DOWN-DRAFT **CARBURETER No. 2291S**

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder Engine: 3.63 Inch Bore, 3.256 Inch Stroke

Dimensions: Flange size, 1¼ inch dual, 4 bolt type
Throttle bore, 1 7/16 inch I. D
Primary venturi, ⅜ inch I. D
Main venturi, 1 3/16 inch I. D.

Float Level: See Adjustments

Vent: Inside balance vent tube to bowl, in air horn above choke valve.

Gasoline Intake: Size No 38 (.1015 inch) drill hole in needle seat

Idle Tube: Jet size 0295 inch diameter.
Idle bleed (in venturi cluster screw), size 0629 inch diameter
Idle restriction (in venturi cluster screw), size 0472 inch diameter.

Idle Port: Upper slot type, length, .149 inch, width, 030 inch

Idle Port Opening: 102 to .106 inch above upper edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size 053 to 057 inch diameter

Set Idle Adjustment Screw: ¼ to 1¼ turns open For richer mixture turn screw out Idle engine between 450 and 500 r p m

Main Nozzle: Nozzle is installed permanently DO NOT REMOVE

Main Vent Tube: Side holes (4) .0354 inch diameter. **Bleed,** in top of tube, size 0275 inch diameter.

Step-Up Rod: (Vacuum operated) 024 inch diameter. **Length** (end of wire to inside of angle), 1⅜ inch.

Metering Jet: Calibrated to flow 360 cc per minute (Do not gauge for size if in doubt replace with new part.)

Accelerating Pump: Pump discharge jets (2), size .0275 inch diameter
Intake ball check seat, size .110 to 120 inch diameter.
Discharge ball check seat, size 130 to 140 inch diameter.

Pump Adjustment: See Adjustments.

Choke: Manual offset butterfly type, with poppet valve.

Vacuum Spark Port: None.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open: 2° B. T. D. C. At Vibration Damper	Valve Setting (Hot) Intake .008" Exhaust .020"	Float Setting See Adjustments	Idle Adjustment Screw Setting ¼ to 1¼ Turns Open Idle engine at 450 to 500 R.P.M.

DATE June 8, 1955

SUBJECT: CHRYSLER C-300 - 1955

The 1955 Chrysler Model C-300 is equipped with two (2) WCFB, Model 2317S, Carter Carbureters.

This 300 horsepower Fire - Power V-8 engine includes a full race cam shaft and rocker-arm valve adjustment. We call your attention to some of the things that are different, and need special consideration at the time of tune-up.

(1) Engine idle 700 r.p.m. with the transmission selector in neutral position (idle adjustment should be finalized with engine at normal operating temperature).

(2) A somewhat uneven engine idle is to be expected.

(3) Mechanical valve mechanism (adjustable).

(4) There may be some roughness on down shift with Power-Flite equipped units.

The engine idle r.p.m. should be reduced to 500 before the ignition timing is set to 10° B.T.D.C. After the ignition timing is set, the idle r.p.m. should be brought back to 700 r.p.m. The ignition distributor characteristics are as follows:

VACUUM ADVANCE CURVE
(In inches of Mercury)

Distr. R.P.M.	Distr. Degrees	Distr. Vacuum	Distr. Degrees
300 - 400	0°	5-1/2" to 6-1/2"	1°
400	0° to 3-1/2°	10"	5° - 6.5°
500	3° to 5°	11"	6° - 8°
800	7° to 9°		

V. F. Thompson,
Service Manager

S S PRINTED IN U S A

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. LATERAL ADJUSTMENT: With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 7/32 inch (gauge T109-283) for primary floats; and 11/32 inch (gauge T109-285) for secondary floats. Adjust by bending float arms.

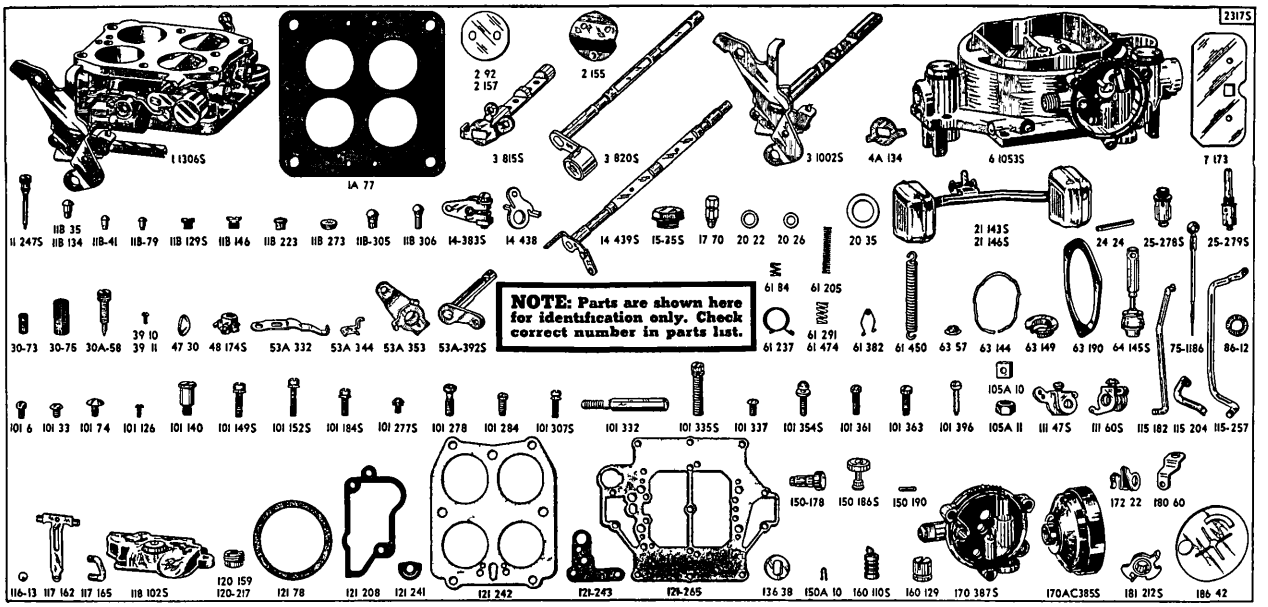
FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of floats, the distance between top of floats and bowl cover should be 23/32 inch for primary floats and 27/32 inch for secondary floats. Adjust by bending stop tabs on float bracket.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at upper angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .015 inch feeler gauge (T109-44) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing lever towards closed position —hold in place and tighten clamp screw. (b) With choke valve tightly closed, tighten fast idle adjustment screw until there is .006-.010 inch (gauge T109-200) opening between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam while making this adjustment.



FAST IDLE ON CAR: 1450 to 1500 R.P.M.

UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16 inch clearance between upper edge of choke valve and inner wall of air horn (gauge T109-28). Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

AUXILIARY THROTTLE VALVE ADJUSTMENT: (a) Disconnect secondary throttle operating rod. (b) Adjust stop lug on secondary throttle lever (use bending tool T109-214) until there is 27/64 inch clearance (gauge T109-242) between lower edge of auxiliary throttle valve and bore, when lug is against stop on flange.

SECONDARY THROTTLE LEVER ADJUSTMENT: The stop lug on both primary and secondary throttle levers should contact boss on flange at the same time. To adjust bend secondary throttle operating rod at angle (use bending tool T109-213). NOTE: Secondary throttle valves will be a few degrees from wide open position.

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle adjustment. 1. With choke valve closed, edge of hook on lock-out arm should contact auxiliary throttle lever, making maximum contact of locking step on lever. 2. Open choke valve. Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position. Adjust by bending lock-out arm.

1955-1956
MODELS IND. 30-31-32-33-34-36

B-B DOWN-DRAFT **CARBURETER—MODEL E7T2**

CARBURETER SPECIFICATIONS

FOR CHRYSLER 6 CYL. ENGINE·

IND. 30-31: 3¼ Inch Bore, 4⅝ Inch Stroke
IND. 32-33: 3-7/16 Inch Bore, 4¾ Inch Stroke
IND. 34: 4 Inch Bore, 5 Inch Stroke
IND. 36: 4-1/16 Inch Bore, 5-5/16 Inch Stroke

Dimensions. Flange size, 1½ inch (38 1 mm)
Throttle bore 1-11/16 inch (42 86 mm)
Main venturi 1 11/32 inch (34 13 mm) I D

Float Setting: When using a solid needle the distance from the top of float should be 5/64 inch (1 98 mm) (gauge T109 50) plus or minus 1/64 inch (397 mm) below top surface of carbureter body casting Float setting for spring loaded needle and seat assembly See footnote * on page two

Vents: Outside none Inside balance vent tube 218 inch diameter, (5 54 mm)

Gasoline Intake Needle Triangular horizontal No 44 (086 inch) (2 18 mm) drill in needle seat

Idle Orifice Tube Jet size 0276 inch (70 mm) drill Idle passage air bleed in air horn, size 0465 inch (1 18 mm) diameter Restriction in body, size 0452 inch (1 15 mm) diameter

Idle Ports: Upper port Slot type length 149 inch (3 78 mm) width 030 inch (76 mm) Top of port located 118 to 122 inch (3 00 to 3 10 mm) above top edge of valve Lower port size 053 to 057 inch (1 35 to 1 45 mm) drill (For idle adjustment screw)

Set Idle Adjustment Screw: ½ to 1½ turns open For richer mixture turn screw out Idle engine between 450-500 r p m

Main Metering Jet: Calibrated to flow 315 to 319 cc per minute (Do not gauge for size If in doubt replace with new part)

Main Vent: Through diffuser (air bleed inside bowl) Size 0315 inch (80 mm) drill

Main Vent Tube: Side Holes 4—0354 inch diameter

Step-Up Jet· Power orifice 0413 inch (1 05 mm) drill

Accelerating Pump: Type—delayed action seasonal adjustment Stroke—Summer setting (inner hole, short stroke) Intermediate setting (center hole) Winter setting (outer hole long stroke) Pump intake passage ball check seat size 115 to 120 inch (2 93 to 3 05 mm) diameter in body Pump discharge passage Restriction (under ball check) size 062 to 065 inch (1 57 to 1 65 mm) diameter in body Pump (discharge) jet size 0374 inch (95 mm) drill

Pump Adjustment: 26/64 inch plunger travel—full throttle position medium stroke Use gauge T109 117S

Choke· Offset butterfly type (with poppet valve)

Vacuum Spark Port: Slot (round end) type, size 040 by 110 inch (1 016 by 2 794 mm) Top of port 052 to 058 inch (1 32 to 1 47 mm) above top edge of valve

Motor Tune-Up—Be Accurate!

CAUTION· Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open	Valve Setting (Hot)	Float Setting	Idle Adjustment Screw Setting
.035"	.020"	(32-36) T. D. C (34) 2° A. T D C (30-31-33) 2° B. T. D C	(30-31) Intake .010" Exhaust .014" (32-33-34) Intake .010" Exhaust .018" (36) Hydraulic Lifters	(Use Gauge T109-50) Solid Needle—5/64 Inch Spring Loaded Needle See Footnote (*) on Page 2	½ to 1½ Turns Open 450 to 500 R.P.M.

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level Wear on lip of float lever will raise float level Before adjusting float, be sure float lever pin is firmly seated Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level Bend vertical lip of float only

If motor stalls while idling, set throttle lever adjusting screw so motor runs between 450-500 r p m Then set idle adjustment screw to specifications If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly Clean tube passages with compressed air

If acceleration is not satisfactory, remove pump jet and clean with compressed air However, it is usually advisable to replace the pump jet, as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a "balance tube' in the air horn The balance tube should be checked each time the

Copyright © 1955
by Carter Carburetor Corporation
Copyright © 1956
by ACF Industries, Incorporated
All Rights Reserved

carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43, main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment: Remove air horn assembly, back out throttle adjustment screw and place pump operating link in center hole of throttle shaft arm Place gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft Turn knurled nut of gauge until lip contacts plunger shaft at closed and wide open throttle positions Difference in readings obtained at closed and wide open throttle positions should be "26" (26/64") plunger travel Adjustments can be made by bending horizontal portion of pump lifter link

Pump stroke adjustable for high or low temperature Set to long stroke for cold weather short stroke for hot weather driving

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT This adjustment must be made with the bowl cover gasket and float pin retainer removed Hold the lip on float arm against the seated intake needle making sure the float pin is at the bottom of its guide slots The distance from the top surface of the body casting to the top of each float should be (975S) 7/32 inch (2221S) 9/32 inch (gauge T109 239) If one float is lower than the other equal ize by bending the float arm If both floats require the same correction adjust by bending lip on float arm The floats must not rub anywhere against the inner walls of the bowl If necessary bend float arm slightly to provide clearance on all sides of floats

PUMP ADJUSTMENT Back out throttle adjusting screw and open choke valve so that throttle valve seats in bore of carbureter Install throttle connector rod in outer hole (long stroke) of throttle lever the distance from the top of the bowl cover to the top of the plunger shaft (not pump arm) should be 54/64 inch Adjust by bending pump connector rod at lower angle (use tool T109-213)

MODELS IND. 5A-6A-7A-8A-13A-14A-15A-16A-22A-30-31-32-33-34-36 (6 Cyl.), IND. 12A (8 Cyl.)

CARBURETER SPECIFICATIONS

FOR CHRYSLER 6 CYL. ENGINE:

IND. 5A: 3¼ Inch Bore, 4⅜ Inch Stroke
IND. 6A-30-31: 3¼ Inch Bore, 4⅝ Inch Stroke
IND. 7A: 3-7/16 Inch Bore, 4¼ Inch Stroke
IND. 8A: 3-7/16 Inch Bore, 4½ Inch Stroke
IND. 13A: 3¾ Inch Bore, 4⅝ Inch Stroke
IND. 14A. 3¾ Inch Bore, 5 Inch Stroke
IND. 15A-34: 4 Inch Bore, 5 Inch Stroke
IND. 16A-32-33: 3-7/16 Inch Bore, 4¾ Inch Stroke
IND. 22A-36: 4-1/16 Inch Bore, 5-5/16 Inch Stroke

FOR CHRYSLER 8 CYL. ENGINE:
IND. 12A: 3¼ Inch Bore, 4⅞ Inch Stroke

Dimensions: Flange size, 1½ inch S. A. E. Throttle bore, 1-11/16 inch (42.86 mm). Main venturi 1-11/32 inch (34.13 mm).

Float Setting: Top of float 5/64 inch (1.98 mm) plus or minus 1/64 inch (.397 mm) below top surface of carbureter body casting.

Vents: Outside none. Inside balance vent tube .218 inch (5.56 mm) inside diameter.

Gasoline Intake Needle: Triangular, horizontal, needle seat hole No. 44 (2.18 mm) drill.

Idle Orifice Tube: Jet size, .0276 inch (.70 mm). Idle passage air bleed (in air horn), size .059 inch (1.50 mm). Idle restriction in body, size .055 inch (1.40 mm).

Idle Ports: Upper port, slot type. Length, .128 inch (3.251 mm). Width .027 inch (.686 mm). Top of port .104 to .110 inch (2.642 mm to 2.794 mm) above top edge of valve (early production), .096-.100 inch (2.388 mm-2.540 mm) above top edge of valve, (late production). Lower port size .053 to .057 inch (1.35 to 1.45 mm) diameter (For idle adjustment screw).

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Do not idle engine below 450 to 500 r.p.m. motor speed.

Vacuum Spark Port: Slot (round end) type: size .040 by .110 inch (1.016 by 2.794 mm). Top of port .052 to .058 inch (1.32 to 1.47 mm) above top edge of valve.

Main Metering Jet: Calibrated to flow (E7D1-D2) 344 to 348 cc, (E7D3) 398 to 402 cc per minute. Do not gauge for size. If in doubt, replace with new part.

Main Vent: Fuel chamber to vent tube well (in air horn) size .063 inch (1.60 mm) diameter. In vent tube plug, size .0433 (1.10 mm) diameter.

Main Tube Side Holes: 1—.0354 (.90 mm) diameter 3/32 inch (2.381 mm) from end
1—.0354 (.90 mm) diameter ⅛ inch (3.175 mm) from end.
1—.0236 (.60 mm) diameter ½ inch (12.70 mm) from end
1—.0236 (.60 mm) diameter 17/32 inch (13.49 mm) from end.
1—.0157 (.40 mm) diameter 1-15/32 inch (37.31 mm) from end

Step-Up Jet: Size .0492 (1.25 mm) diameter

Accelerating Pump: Type vacuum operated. Stroke, non-adjustable. Pump intake passage ball check seat, size .115 to .120 inch (2.93 to 3.05 mm) diameter
Pump discharge passage, ball check seat size, .062 to .065 inch (1.58 to 1.65 mm) diameter
Pump discharge jet, size .0315 inch (.80 mm) diameter

Choke: Offset butterfly type with poppet valve.

CARBURETER ADJUSTMENTS

Correct float adjustment is important and should be made in the following way:

Place float gauge (No. T109-50) across the carbureter body. Press float lever down to hold float pin against the bottom of the slot in the body casting. Floats should just clear the projections on the gauge. If adjustment is necessary, bend lip on float lever toward intake needle to lower level or away from the needle to raise the float level.

If motor stalls while idling, set throttle lever adjusting screw so motor runs between 450 and 500 R.P.M. Then set idle adjustment screw ½ to 1½ turns open from closed position. If a vacuum gauge is available, adjust to highest steady gauge reading.

Accelerating pump is actuated by the intake manifold vacuum and no adjustment is necessary. However, be sure the bowl cover gasket and flange gasket seal to prevent any air leaks to the pump vacuum passages.

CARBURETER ADJUSTMENTS

Correct float adjustment is important and should be made in the following way.

Place float gauge (No. T109-50) across the carbureter body. Press float lever down to hold float pin against the bottom of the slot in the body casting Floats should just clear the projections on the gauge If adjustment is necessary, bend lip on float lever toward intake needle to lower level or away from the needle to raise the float level

If motor stalls while idling, set throttle lever adjusting screw so motor runs between 450 and 500 R P M. Then set idle adjustment screw ½ to 1½ turns open from closed position. If a vacuum gauge is available, adjust to highest steady gauge reading

Accelerating pump is actuated by the intake manifold vacuum and no adjustment is necessary. However, be sure the bowl cover gasket and flange gasket seal to prevent any air leaks to the pump vacuum passages.

If engine misses when load is suddenly increased, remove pump jet and clean with compressed air However, it is usually advisable to replace the pump jet, as its cost is nominal. (All jets must be seated gasoline tight) This condition may also be due to damaged or worn plunger leather in accelerating pump cylinder or discharge check in discharge passage. If plunger is removed from cylinder, use care when installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a "balance tube" in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

(Equipped with Fluid Coupling or Automatic Transmission)

B-B DOWN-DRAFT CARBURETER—**E7R1**

CARBURETER SPECIFICATIONS

For Chrysler Six Cylinder Engine 3-7/16 Inch Bore, 4¾ Inch Stroke

Dimensions Flange size 1½ inch
Throttle bore 1 11/16 inch
Main venturi 1 11/32 inch I D

Float Setting When using a solid needle the distance from the top of float should be 5/64 inch (gauge T109 50) plus or minus 1/64 inch below top surface of carbureter body casting Float setting for spring loaded needle and seat assembly See footnote (†) on page two

Vents Outside none Inside balance vent tube 218 inch diameter

Gasoline Intake Needle Triangular horizontal No 44 (086 inch) drill in needle seat

Idle Orifice Tube Jet size 0276 inch drill Idle passage air bleed in air horn size 0465 inch diameter Restriction in body size 0452 inch diameter

Idle Ports Upper port Slot type length 149 inch width 030 inch Top of port located 118 to 122 inch above top edge of valve Lower port size 053 to 057 inch drill (For idle adjustment screw)

Set Idle Adjustment Screw ½ to 1½ turns open For richer mixture turn screw out Idle engine between 450 500 r p m

Main Metering Jet Calibrated to flow 315 to 319 cc per minute (Do not gauge for size If in doubt replace with new part)

Main Vent Through diffuser (air bleed inside bowl) Size 0315 inch drill

Main Vent Tube Side Holes 4—0354 inch diameter

Step-Up Jet Size 0413 inch diameter

Accelerating Pump Type—delayed action seasonal adjustment Stroke—Summer setting (inner hole short stroke) Intermediate setting (center hole) Winter setting (outer hole long stroke) Pump intake passage ball check seat size 115 to 120 inch diameter in body Pump discharge passage Restriction (under ball check) size 062 to 065 inch diameter in body Pump (discharge) jet size 0374 inch drill

Pump Adjustment 26/64 inch plunger travel—full throttle position medium stroke Use gauge T109 117S

Choke Offset butterfly type (with poppet valve)

Slow Closing Throttle Dash pot with discharge (by pass) size 0197 inch drill through plunger shaft

Vacuum Spark Port Slot (round end) type size 040 by 110 inch Bottom of port 012 to 018 inch above top edge of valve

Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Set Breaker Points	Ignition Timing Breaker Points to Open	Set Valves (Hot)	Float Setting	Idle Adjustment Screw Setting
.035"	020"	(32)—T D C (33)—2° B T D C	Intake 010" Exhaust 018"	(Use Gauge T109-50) Solid Needle—5/64 Inch Spring Loaded Needle See Footnote on Page 2	½ to 1½ Turns Open 450 to 500 R. P M

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service check float level Wear on lip of float lever will raise float level Before adjusting float be sure float lever pin is firmly seated Reset float level by bending lip of float lever away from needle to raise level or bend lip toward needle to lower float level Bend vertical lip of float only

If motor stalls while idling set throttle lever adjusting screw so motor runs between 450 500 r p m Then set idle adjustment screw to specifications If these adjustments do not correct the trouble remove idle orifice tube and plug assembly Clean tube and passages with compressed air

If acceleration is not satisfactory, remove pump jet and clean with compressed air However it is usually advisable to replace the pump jet as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a balance tube in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type size or condition of air cleaner Should the cleaner become clogged the capacity will be reduced but the air fuel mixture ratio will not be changed

CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

Excessive richness may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109 43 main vent tube can be removed and a new tube inserted with tool No T109 195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment Remove air horn assembly back out throt tle adjustment screw and be sure pump operating link is in center hole of throttle shaft arm Place universal pump travel gauge T109 117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft Turn knurled nut of gauge until lip contacts top of plunger shaft with throttle valve seated Take reading indicated on gauge Repeat with throttle valve wide open and plunger pushed to bottom of cylinder The dif ference in reading obtained should be '26 (26/64") plunger travel

Adjust by bending horizontal portion of pump lifter link Pump stroke adjustable for high or low temperatures Set to longest stroke for cold weather shorter stroke for hot weather driving

Dash-Pot Adjustment Engines operating in connection with fluid couplings frequently tend to stall during rapid deceleration unless the throttle closes slowly Slow throttle movement is necessary only during the last part of the closing The dash pot or decelerating pump acts as a snubber to the throttle allowing fast movement to almost closed position then slow closing from that point to the idle position

When the throttle is released the throttle valve closes rapidly until throttle shaft arm contacts the dash pot pick up arm Then the dash pot plunger must be pushed to the bottom of the cyl inder before the throttle can close A ball check located in the lower end of the plunger shaft seals the larger upper opening and the gasoline must leave the cylinder through the small metered hole in lower part of the shaft

This reduces the rate at which plunger can be forced to the bottom of the cylinder making the last part of the throttle clos ing very slow **The adjusting screw** (in top of bowl cover) **should be opened five full turns from closed position** for average con ditions Under extreme driving conditions greater openings may be necessary although extreme dash pot action will affect gear changes and not enough action will allow engine to stall

Be sure plunger leather is soft and pliable and effects a good seal against the cylinder wall

Chrysler Industrial—1955—Carbureter E7R1

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder Engine 3 63 Inch Bore, 3 63 Inch Stroke

Dimensions Flange size 1¼ inch dual 4 bolt type
Throttle bore 1 7/16 inch I D
Primary venturi ⅜ inch I D
Main venturi 1 3/16 inch I D

Float Level See adjustments

Vent Inside balance vent tube to bowl in air horn above choke valve

Gasoline Intake Size No 38 (1015 inch) drill hole in needle seat

Idle Tube Jet size 0334 inch diameter
Idle bleed (in venturi cluster screw) size 063 inch drill
Idle restriction (in venturi cluster screw) size 0472 inch drill

Idle Port Upper slot type length 149 inch width 030 inch

Idle Port Opening 102 to 106 inch above upper edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw) Size 053 to 057 inch diameter

Set Idle Adjustment Screw ¼ to 1¼ turns open For richer mixture turn screw out With gear shift lever in neutral position idle engine between 450 and 500 RPM

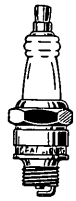
Main Nozzle Nozzle is installed permanently DO NOT REMOVE

Main Vent Tube Side holes 6—bottom three holes (from closed end) size 0354 inch next two holes 0236 inch top hole 0197 inch diameter
Main vent in top of tube size 0275 inch diameter

Step Up Rod (Vacuum operated) 022 inch diameter

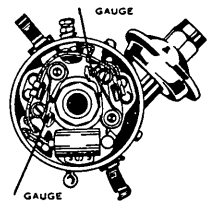
Metering Jet Calibrated to flow 356 to 364 cc per minute (Do not gauge for size if in doubt replace with new part)

Accelerating Pump Pump discharge jets (2—in venturi cluster) size 0275 inch drill
Intake ball check seat size 135 to 140 inch diameter
Discharge ball check seat size 110 to 120 inch diameter



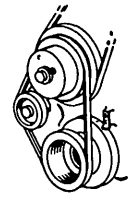
Pump Adjustments See adjustments

Choke Carter Climatic® Control set at index Butterfly type offset valve Choke heat suction hole in body size No 51 (1015 inch) drill
NOTE Thermostatic coil should not be removed from delay mounting post If defective replace with complete thermostatic coil and housing assembly

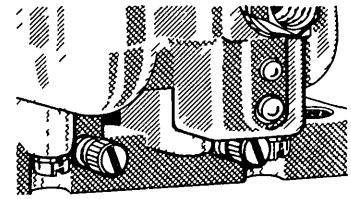


Vacuum Spark Port Horizontal round end type 030 by 110 inch Top of port to be 035 to 045 inch above upper edge of valve with valve closed tight

Motor Tune-Up—Be Accurate!



CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap 035"

Breaker Point Setting 017"

Ignition Timing Breaker Points to Open 6° B T D C

Idle Adjustment Screw Setting ¼ to 1¼ Turns Open

NOTE These cars equipped with Hydraulic Valve Lifters NO ADJUSTMENT

CARBURETER ADJUSTMENTS

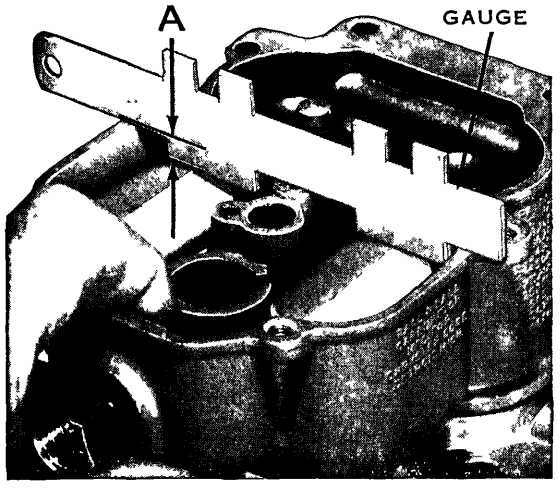

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

This adjustment must be made with the bowl cover gasket and float pin retainer removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots. The distance (A) from the top surface of the body casting to the top of each float should be 7/32 inch (gauge T109-239). If one float is lower than the other, equalize by bending the float arm If both floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywhere against the inner walls of the bowl. If necessary, bend float arms slightly to provide clearance on all sides of floats.

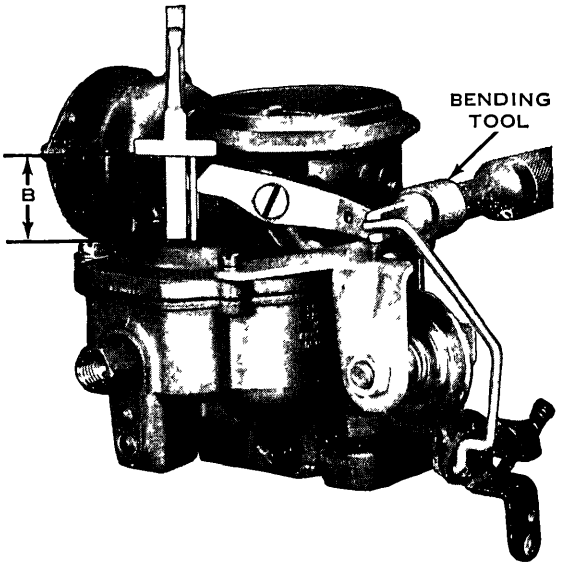

Figure 2
Pump Adjustment

PUMP ADJUSTMENT (Fig. 2):

Back out throttle adjustment screw and open choke valve so that throttle valves seat in bores of carbureter. Install throttle connector rod in outer hole (medium stroke) of throttle lever and inner hole of pump arm. The distance (B) from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 54/64 inch. Adjust by bending pump connector rod (2180S-SA-SB) at lower angle; (2162S-SA-SB) at upper angle (use tool T109-213).

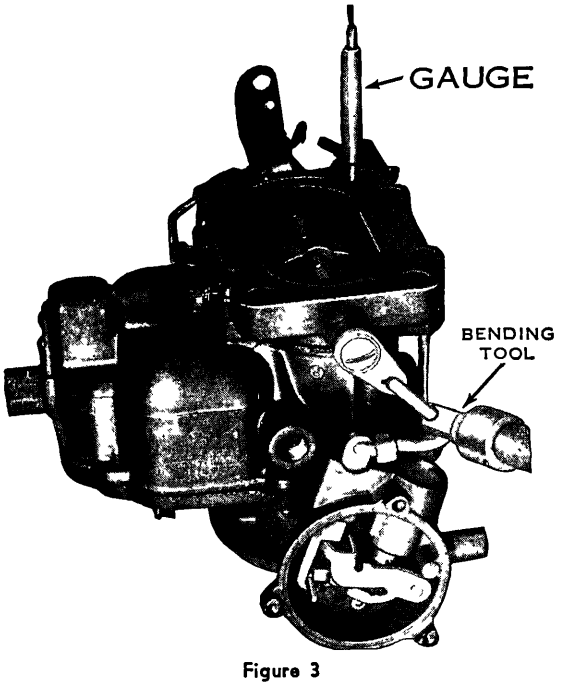

Figure 3
Fast Idl Adjustment

FAST IDLE ADJUSTMENT (Fig. 3):

Remove thermostatic coil housing assembly, gasket and baffle plate. With throttle adjusting screw backed out crack throttle valve and hold choke valve in fully closed position. Then close throttle. This will allow fast idle cam to revolve to fast idle position. There should now be .015"-.019" clearance (use gauge T109-44) between throttle valve and bore of carbureter (side opposite idle port). Adjust by bending the choke connector rod at lower angle (use tool T109-213).

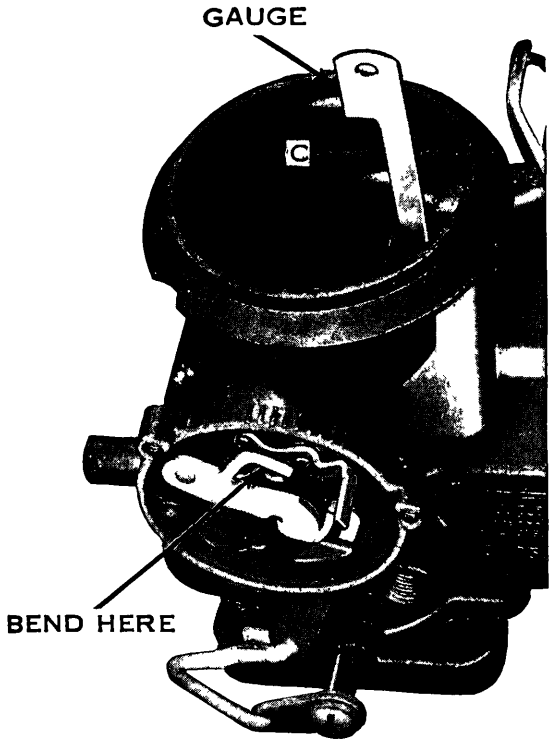

Figure 4
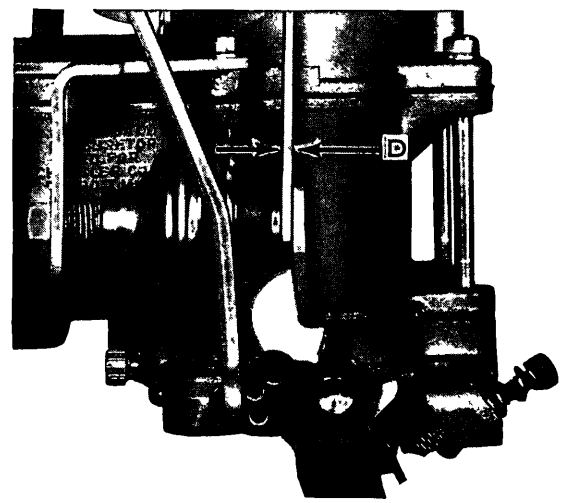
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 4):

This adjustment must be made after the fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing. There should now be 1/4 inch clearance (C) (use gauge T109-31) between upper edge of choke valve and inner wall of air horn. Adjust by bending arm on the choke trip lever (use tool T109-214). When fast idle and unloader adjustments have been made, assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn. Set Climatic® Control at "Index", making sure that hook on coil has picked up coil shaft lever.

DASH POT (SLOW CLOSING THROTTLE) ADJUSTMENT (2162S-SA-SB ONLY) (Fig. 5):

The purpose of this unit is to prevent the car from stalling when the throttle is released rapidly. Maximum action is obtained by loosening lock nut and adjusting the dash pot unit so that the plunger shaft can be bottomed with a 1/16 inch gauge placed between shaft and operating lever (D) with throttle valves tightly closed.



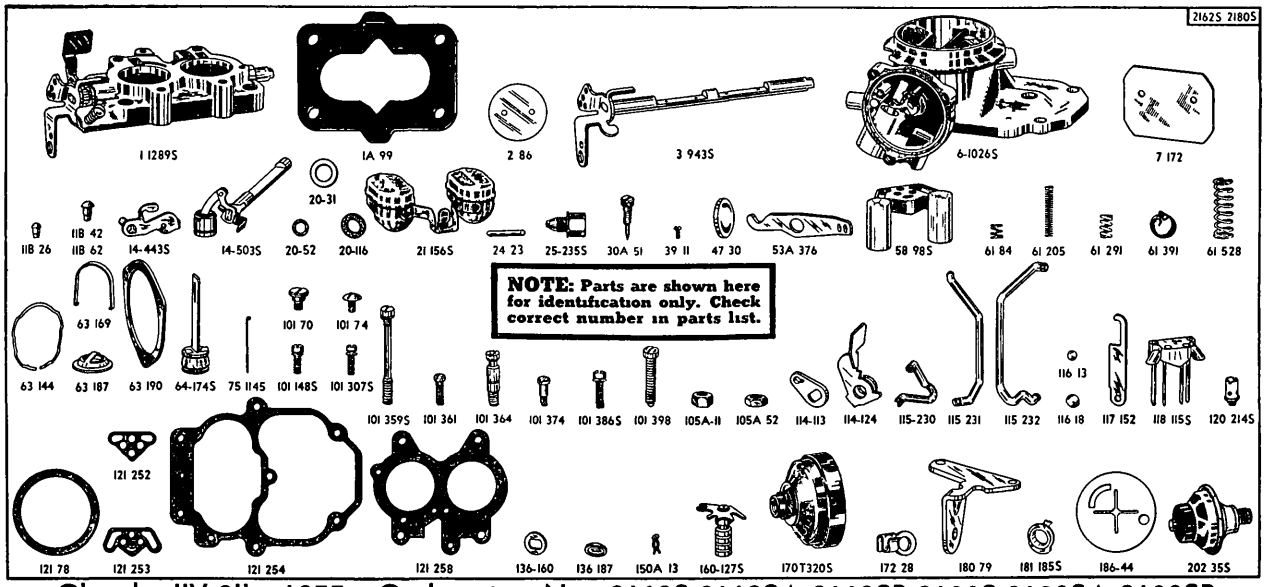


Figure 5
Dash Pot Adjustment

WCFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2126S**

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder Engine: 3.81 Inch Bore, 3.63 Inch Stroke (C-68, C-69, C-70)
For Chrysler 8 Cylinder Engine: 3.63 Inch Bore, 3.63 Inch Stroke (C-67)

Dimensions: Flange size, 1⅛ inch Four Bore—4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi, size, 1-1/16 inch.

Float Level: See adjustments.

Vents: Outside, 2 on primary side, 2 on secondary side. Inside, 2 on primary side, 3 on secondary side.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: Jet, size No. 69 (.02925 inch) drill.
By Pass, in body, size (.057 inch) drill.
Economizer, size (.0452 inch) drill.
Idle bleed, in body, size No. 44 (.086 inch) drill.

Idle Port: Upper, slot type. Primary, length .136 inch; width .030 inch. Secondary, length .101 inch; width .030 inch.

Idle Port Opening: Primary, .084 to .092 inch above top edge of valve with valve tightly closed. Secondary, .071 to .077 inch.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill. Secondary, constant feed, size .040 inch diameter.

Set Idle Adjustment Screw: ¾ to 1¾ turns open. For richer mixture turn screw out. Do not idle engine below 500 RPM. in neutral.

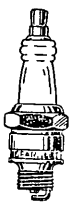
Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating jet (to nozzle well), primary side, (to idle well) secondary side, size No. 70 (.028 inch) drill.

Metering Rod: Primary, economy step .072 inch diameter. Middle step tapers to .060 inch diameter. Power step .050 inch diameter. Secondary, none.

Metering Rod Jet: Primary, size .0935 inch diameter (for metering rod).
Secondary, size (.053 inch) diameter (no metering rod).

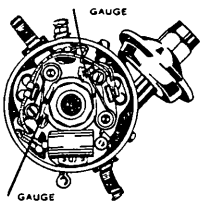
Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 70 (.028 inch) drill.
Intake ball check seat, size .115 to .120 inch diameter.
Discharge needle seat, size .070 inch diameter.
Relief passage (vent) to fuel chamber No. 42 (.0935 inch) drill.
Discharge relief plug, size No. 74 (.022 inch) drill.



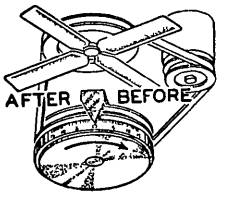
Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control, set on index. Butterfly type, offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 40 (.098 inch) drill.



Vacuum Spark Port: Horizontal slot (round end) .045 by .110 inch. Top of port .032 to .042 inch above valve with valve tightly closed.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

S S PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical.

Lateral Adjustment: With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats.

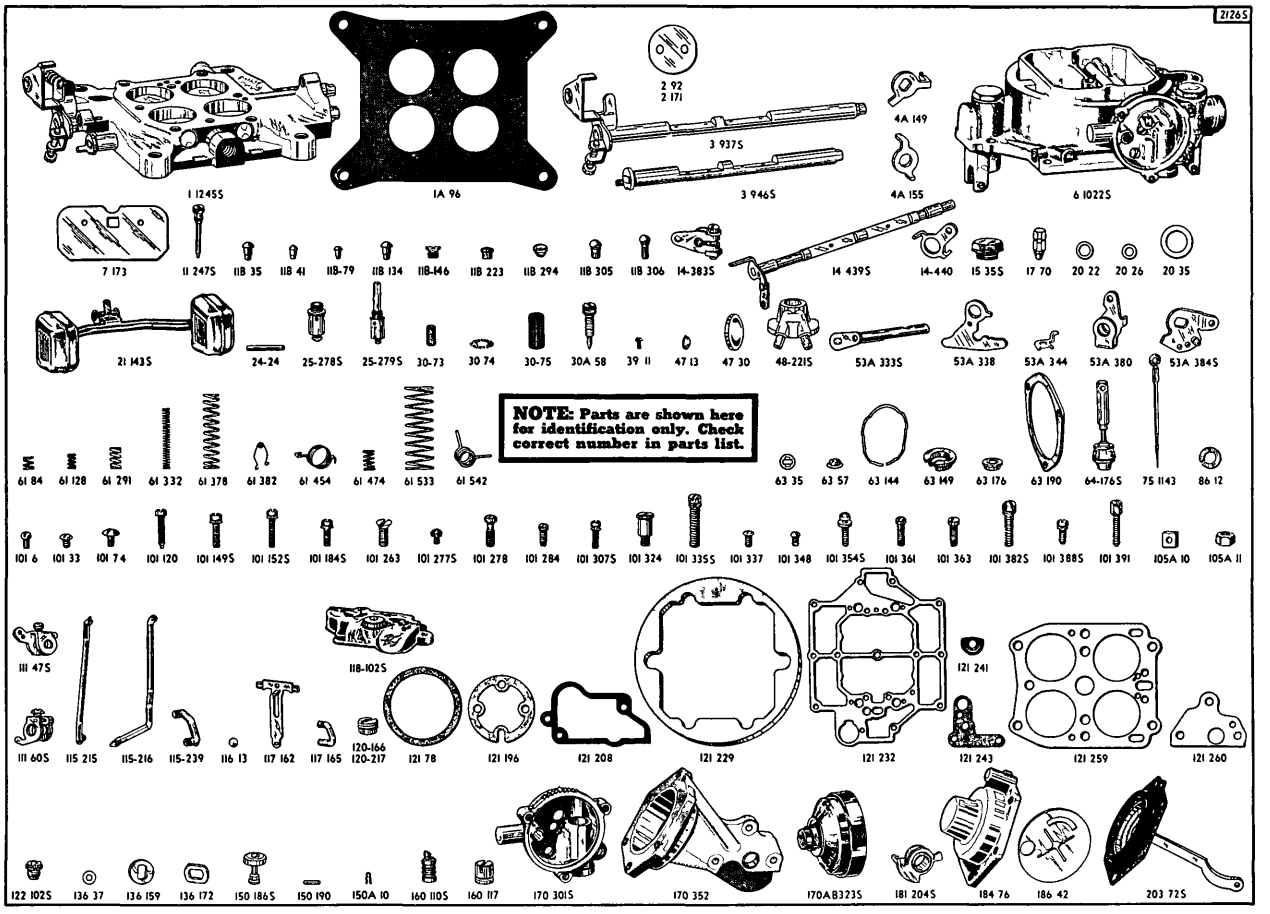
Vertical Adjustment: With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109-232) for primary floats; and 3/16 inch (gauge T109-222) for secondary floats. Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of floats, the distance between top of floats and bowl cover should be 5/8 inch for primary floats and 11/16 inch for secondary floats. Adjust by bending stop tabs on float bracket.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending outward toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.



FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .010 inch wire gauge (T109-200) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position — hold in place and tighten clamp screw. (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is .018 inch (gauge T109-44) opening between throttle valve and bore of carbureter, side opposite idle port. Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle and secondary throttle lever adjustments. Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. If necessary to adjust, bend tang on secondary throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT

1. Block choke valve wide open.
2. Back out throttle lever stop screw so that primary valves seat in carbureter bores.
3. While holding the secondary throttle open slightly, close the primary valves. The primary and secondary valves should become tightly closed at the same time. Check to be sure that secondary throttle valves are tightly closed by attempting to open the secondary throttle valves while holding the primary throttle valves closed.
4. To adjust, bend the throttle operating rod slightly.

(With Power Flite Transmission)

1954

BB DOWN-DRAFT CLIMATIC® CONTROL CARBURETER No. E9B1

CARBURETER SPECIFICATIONS

For Chrysler 6 Cylinder Engine: 3-7/16 Inch Bore, 4¾ Inch Stroke

Dimensions: Flange Size 1½ inch S.A.E. Throttle bore, 1-11/16 inch. Main Venturi, 1-11/32 inch I.D.

Float Setting: See adjustments.

Vents: Outside, none. Inside, balance vent tube in air horn above choke valve.

Gasoline Intake: Size No. 44 (.086 inch) drill in needle seat.

Idle Orifice Tube: Jet, size .0295 in. diameter. Idle passage air bleed, in air horn, size No. 56 (.0465 inch) diameter. Restriction in body, size .0492 inch diameter.

Idle Port: Upper port, slot type, length .149 inch; width .030 inch.

Idle Port Opening: Top or port located .118 to .122 inch above top edge of valve, with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size .053 to .057 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Idle engine at 500 r.p.m.

Main Metering Jet: Calibrated to flow 315 to 319 cc per minute. (Do not gauge for size. If in doubt replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl). Size .0315 inch diameter.

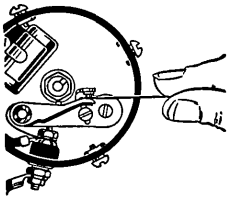
Main Vent Tube: Side holes, 4—.0354 inch diameter.

Step-Up Jet: Power orifice .0374 inch diameter.

Accelerating Pump: Pump intake passage, ball check seat, size .107 to .112 inch diameter. Pump discharge passage, restriction (under ball check), size .062 to .065 inch diameter. Pump (discharge) jet, size .0413 inch diameter.

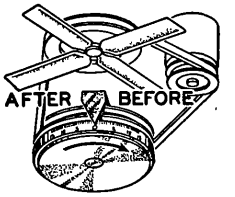
Pump Adjustment: See adjustments.

Choke: Carter Climatic ® Control, set on Index. Choke heat suction hole, in flange insulator, size No. 38 (.1015 inch) drill.

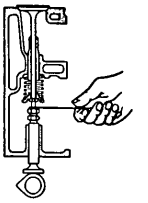


Vacuum Spark Port: Slot, round end type, size .040 by .110 inch. Top of port .012 to .018 inch above top edge of valve with valve tightly closed.

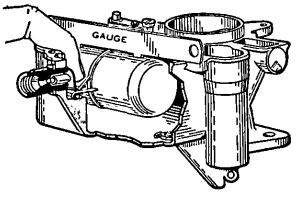
Motor Tune-Up—Be Accurate!



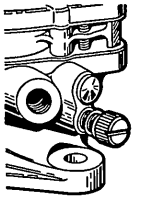
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and tests compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open 2° B.T.D.C.

Valve Setting (Hot) Intake .008" Exhaust .010"

Float Setting 5/64 Inch ± 1/64 Inch (Use Gauge T109-50)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

Float Adjustment: This adjustment must be made with the bowl cover gasket and float pin retainer removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots. The distance from the top surface of the body casting to the top of the float should be 5/64 inch (gauge T109-50). To adjust bend lip on float arm.

Pump Adjustment: No gauge is necessary. Pump lifter arm should be at a right angle to pump lifter shaft. Adjustment can be made by bending pump lifter arm up or down (Use tool T109-41). Pump Stroke adjustable for high or low temperatures. Set to longest stroke for cold weather, shorter stroke for hot weather driving.

Fast Idle Adjustment: Remove thermostatic coil housing assembly, gasket and baffle plate. With throttle adjusting screw backed out, crack throttle valve and hold choke valve in fully closed position. Then close throttle. This will allow fast idle cam to revolve to fast idle position. There should now be .015"-.019" clearance (use gauge T109-44) between throttle valve and bore of carbureter, side opposite idle port. Adjust by bending the choke connector rod at lower angle (use tool T109-41).

WCFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2041S**

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder Engine: 3-13/16 Inch Bore, 3⅝ Inch Stroke

Dimensions: Flange size, 1⅛ inch Four Bore—bolt tye.
Primary venturi size, 11/32 inch I. D.
Main venturi size, 1-1/16 inch I. D.

Float Level: See adjustments.

Vents: Inside, primary side (2), secondary side (3). Outside, primary side (2) size No. 38 (.1015 inch) drill; secondary (2) size No. 42 (.0935 inch) drill.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: Jet, size No. 69 (.0292 inch) drill. By-pass (2 in low speed jet), size No. 56 (.0465 inch) drill Economizer in body size No. 56 (.0465 inch) drill.
Idle bleed, in body, size .059 inch diameter.

Idle Port: (Upper) Slot type. Primary, length .140 inch; width .030 inch. Secondary length .103 inch; width .030 inch.

Idle Port Opening: Primary, .091 to .097 inch, secondary, .067 to .073 inch, above upper edge of valve, with valve tightly closed.

Lower Port: Primary (For Idle Adjustment Screw) size No. 53 (.0595 inch) drill. Secondary (None).

Set Idle Adjustment Screw: 1 to 2 turns open. For richer mixture turn screw out. Do not idle engine below 500 R.P.M with shift lever in neutral position.

Main Nozzle: Installed permanently. Do not remove. Anti-percolating jet, size No. 70 (.028 inch) drill.

Metering Rod: Primary, economy step .071 inch diameter. Middle step tapers to .062 inch diameter. Power step .058 inch diameter.

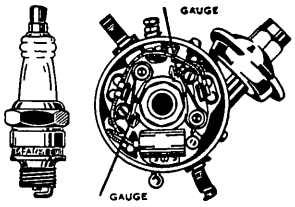
(These rods designed with stabilizing flats on economy step.)
Secondary, none.

Metering Rod Jet: Primary, size .0935 inch diameter (for metering rod).

Secondary, size .0595 inch diameter (no metering rod).

Metering Rod Setting: See adjustments.

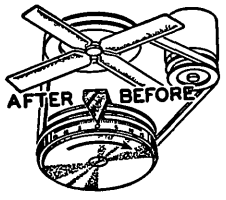
Accelerating Pump: Discharge jet (twin) primary only, size No 68 (.031 inch) drill. Intake ball check seat size .115 to .120 inch diameter. Discharge needle seat size .070 inch diameter.



Pump Adjustment: See adjustments.

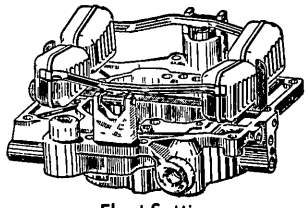
Choke: Carter Climatic® Control, set on Index. Butterfly type offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 40 (.098 inch) drill.

Vacuum Spark Port: Horizontal slot (round end) .045 x .110 inch. Top of port .035 to .045 inch above valve, with valve tightly closed.

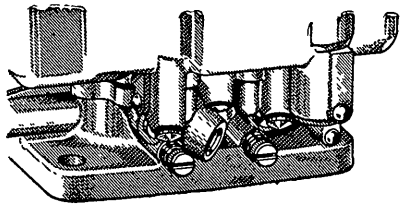


Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting .017"

Ignition Timing Breaker Points to Open: 4° B.T.D.C.

Float Setting Primary ⅛ Inch (Use Gauge T109-232) Secondary ¼ Inch (Use Gauge T109-223)

Idle Adjustment Screw Setting 1 t 2 Turns Open

NOTE: These cars equipped with hydraulic valve lifters.—No adjustment.

CARBURETER ADJUSTMENTS

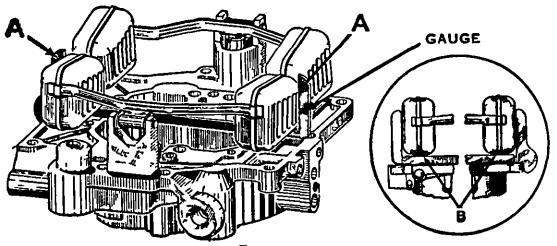

Figure 1
Float Adjustment

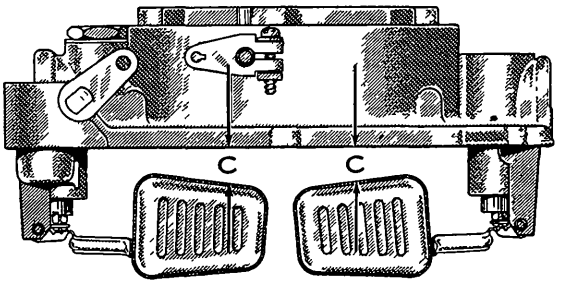

Figure 2
Float Drop Adjustment

FLOAT ADJUSTMENT (Fig. 1):

Two separate float adjustments must be be made—lateral and vertical

Lateral Adjustment: With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portions of gauge fitted over edges of casting Side of floats should just clear the vertical upright of float gauge (A) Adjustment should be made by bending arms of floats

Vertical Adjustment: With float gauge in same position, floats should just clear the horizontal portion of gauge The vertical distance (B) between top of float and machined surface of casting must be 1/8 inch (gauge T109-232) for primary floats and 1/4 inch (gauge T109 223) for secondary floats Adjust by bending float arms

FLOAT DROP ADJUSTMENT (Fig. 2):

With bowl cover held in upright position and measuring from center of float (C), the distance between top of floats and bowl cover should be 5/8 inch for primary floats and 3/4 inch for secondary floats Adjust by bending stop tabs on float bracket

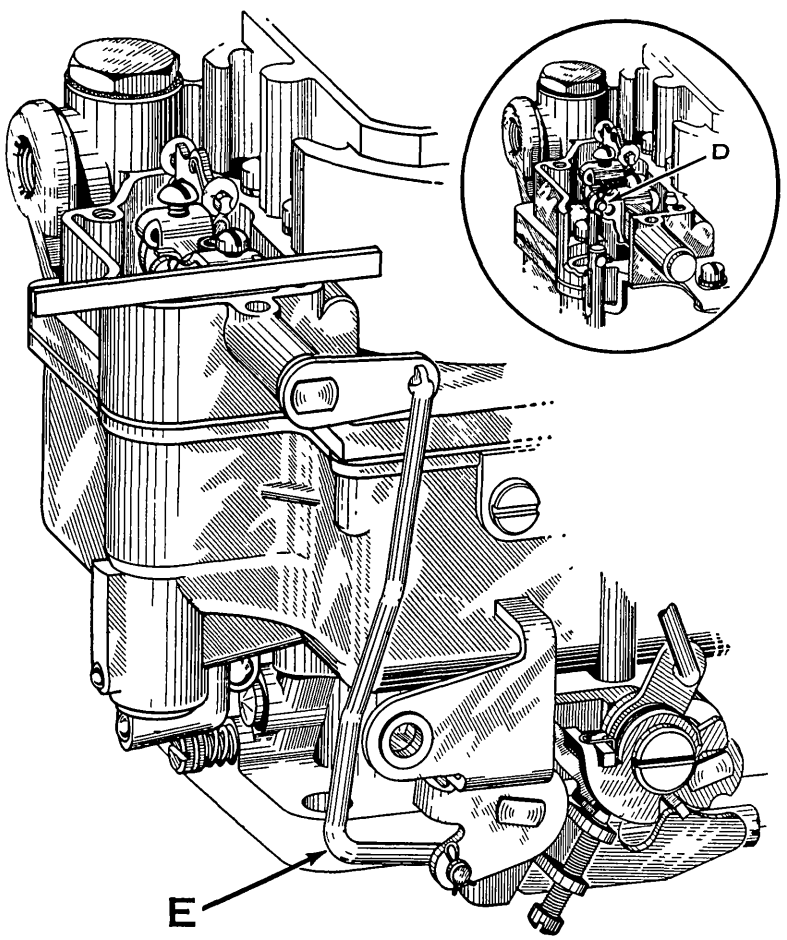

Figure 3
Pump Adjustment

PUMP ADJUSTMENT (Fig. 3):

Install pump connector link in outer hole (long stroke) of pump arm (D), with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle (E). (Use tool T109-213).

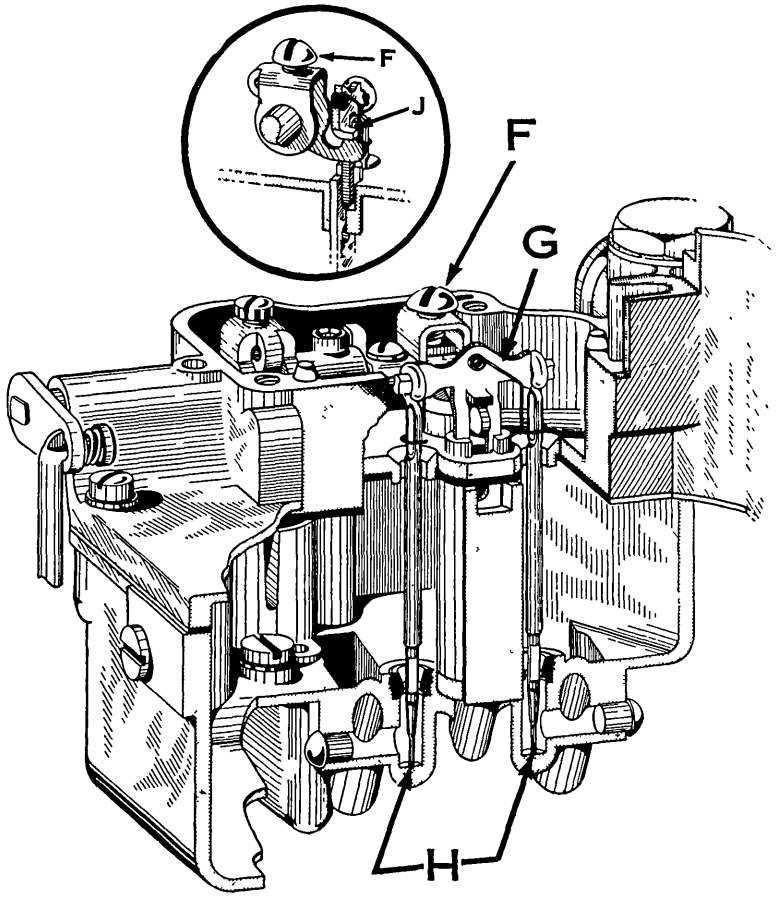

Figure 4
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 4):
Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (F) 2. With metering rods in place, press down on vacumeter link (G) until metering rods bottom in carbureter body casting (H). 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link (J). Hold in place and carefully tighten clamp screw (F).

BOWL VAPOR VENT ADJUSTMENT (Fig. 5):
This adjustment should be made after completing pump and metering rod adjustments. Install dust cover gasket and dust cover. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (K) (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm (L).

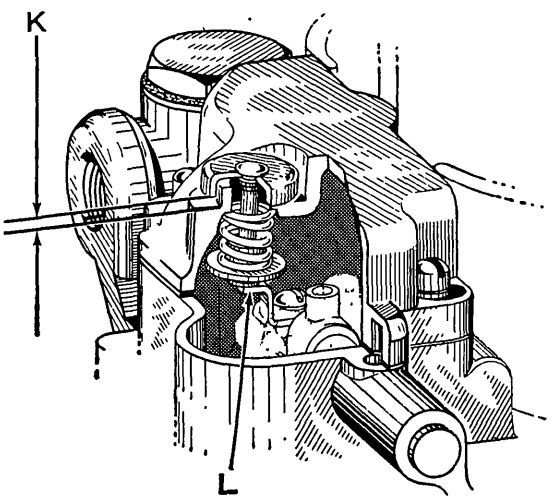

Figure 5
Bowl Vapor Vent Adjustment

FAST IDLE AND SECONDARY THROTTLE LOCKOUT ADJUSTMENT (Fig. 6):
1. Preliminary Adjustment: Loosen choke clamp screw (M) on choke shaft. Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting (N). Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (M). 2. Secondary Throttle Lock-Out Adjustment: (a) With choke valve tightly closed, tighten fast idle adjusting screw until there is .015 inch (P) (gauge T109-44) opening between primary throttle valve and bore of carbureter (side opposite idle port). Lock pawl should now be in unlocked position; if not, adjust by bending tang (R) on lock pawl (use bending tool T109-105). (b) Hold primary throttle valves half way open. Open choke valve fully, then open primary throttle valves all the way. Tang (S) on secondary throttle arm should engage in notch (T) on lock out lever (U) preventing secondary throttle shaft movement. Keep choke valve in wide open position. Close primary throttle valves so that lock pawl is unlocked, then open primary throttle valves all the way. Lock-out lever (U) should fall free allowing secondary throttle valves to be open before primary throttle valves are fully open. If necessary, bend tang (S) on secondary throttle lever to provide clearance for proper operation of lock-out lever.

WCD DOWN-DRAFT CLIMATIC® CONTROL **CARBURETERS Nos. 2039S-2039SA**

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder Engine: 3-13/16 Inch Bore, 3⅝ Inch Stroke

Dimensions: Flange size 1¼ inch S A E dual, 4 bolt (water jacket) type
Throttle bore, 1-7/16 inch
Primary venturi, 11/32 inch I D
Main venturi, 1-3/16 inch I D

Float Level: See adjustments

Vents: Inside None. Outside Two—3/16 inch diameter vents in air horn

Gasoline Intake: Size No 38 (1015 inch) drill hole in needle seat

Low Speed Jet Tube: Jet size 0295 inch drill Bypass, size No 58 (042 inch) drill Economizer size 0452 inch drill Idle bleed, size No 58 (042 inch) drill

Idle Port: Upper port, length .175 inch; width 030 inch

Idle Port Opening: .136 to .140 inch above upper edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size .0615 to 0655 inch diameter

Set Idle Adjustment Screw: ½ to 1 turn open For richer mixture turn screw out With gear shift lever in neutral position idle engine at 500 r p m

Main Nozzle: Nozzles are installed permanently Do not remove

Metering Rod: Vacumeter type Economy step 0695 inch diameter Middle step tapers to 0665 inch diameter Power step 056 inch diameter These rods designed with stabilizing flats on economy step

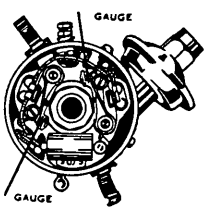
Metering Rod Jet: 089 inch diameter

Metering Rod Setting: See adjustments

Accelerating Pump: Pump discharge jet (twin) size (0315 inch) drill Intake ball check seat size No 32 (116 inch) drill Discharge needle seat size No 50 (070 inch) drill

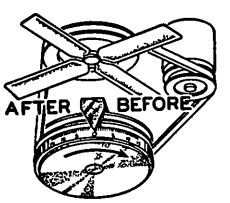
Pump Adjustment: See adjustments

Choke: Carter Climatic® Control—Set at index Butterfly type, offset valve Choke heat suction hole in bowl cover size No 43 (089 inch) drill

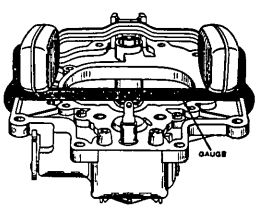


Vacuum Spark Port: 030 x .110 inch Top of port to be 035 to 041 inch above top edge of valve with valve tightly closed

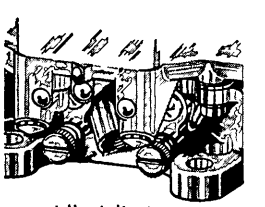
Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting .017"

Ignition Timing Breaker Points to Open: 4° B. T. D. C. At Vibration Damper

Float Setting (See Adjustments)

Idle Adjustment Screw Setting ½ to 1 Turn Open

NOTE· These cars equipped with hydraulic valve lifters—No adjustment.

CARBURETER ADJUSTMENTS

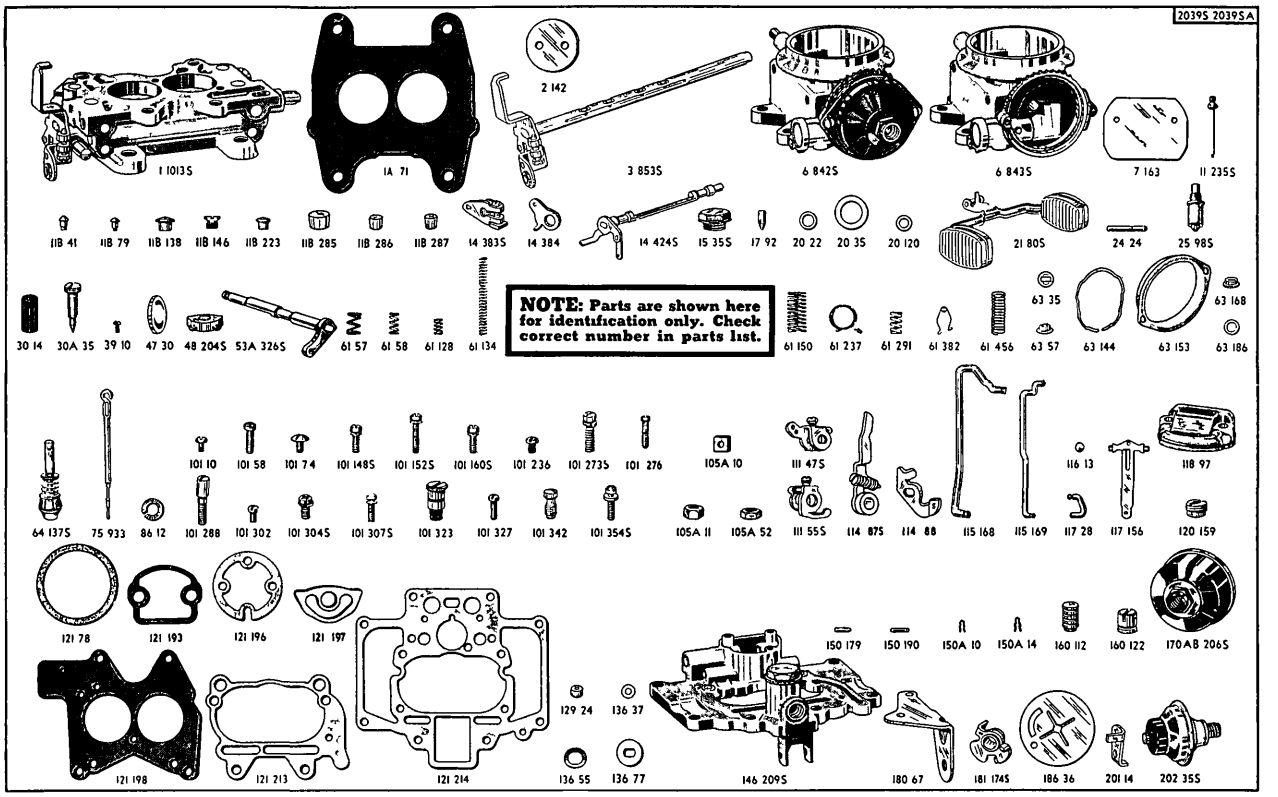
FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical.

Lateral Adjustment: With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge T109-205 directly under float with notched portions of gauge fitted over edges of casting. Sides of floats should barely touch the vertical uprights of float gauge. Adjustment should be made by bending arms of floats.

Vertical Adjustment: With float gauge in same position shown, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting should be 11/64 inch (gauge T109-205). Adjustment can be made by bending arms of floats. Carefully remove float assembly, install bowl cover gasket and then reinstall float assembly. Floats should have a free movement of 1/2" at free end of float. Adjust by bending lip of float bracket. A fast check of the fuel level can be made on the car by removing the inspection hole plug in the side of carbureter body. Fuel should just run out of the hole with engine idling.

PUMP ADJUSTMENT: The total distance the plunger head (not shaft) moves from closed to wide open throttle position determines the amount of fuel discharged. Correct pump plunger travel is important and should be checked each time the carbureter is disassembled or when leaner than standard metering rods are installed. Procedure is as follows: Install pump connector link in outer hole (long stroke) of pump arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Be sure fast idle adjusting screw does not hold throttle open. With air horn assembly removed, place Universal pump travel gauge T109-117S, inverted on edge of dust cover boss of bowl cover. Turn knurled nut of gauge until finger just touches upper end of plunger shaft. Number indicated on gauge should be "29". Hold the gauge vertical to insure correct reading. Adjust by bending throttle connector rod at upper angle. (Use tool T109-213.)

Optional Adjustment: With throttle valves seated in bores of carbureter, the distance from the top of the plunger shaft to the top of the dust cover boss should be 17/64". Adjust as mentioned above.



METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: Backout throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

FAST IDLE ADJUSTMENT: 1. Loosen choke lever clamp screw on choke shaft. Insert .040" feeler gauge T109-193 between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever toward closed position—hold in place and tighten clamp screw. 2. With choke valve tightly closed, tighten fast idle adjusting screw until there is .017"-.021" opening (wire gauge T109-44 may be used) between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

UNLOADER ADJUSTMENT: With throttle wide open there should be 7/32" clearance between upper edge of choke valve and inner wall of air horn (gauge T109-106). Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

DASHPOT (SLOW CLOSING THROTTLE) ADJUSTMENT: (a) The distance from the inner side of bracket to the diaphragm housing should be 3/16 inch. To adjust loosen lock nut, turn diaphragm assembly to specified amount and tighten lock nut. (b) With dashpot operating lever adjusting screw backed out and throttle valves seated, fully depress diaphragm by pressing against dashpot operating lever. Tighten screw until it just contacts throttle shaft arm, then back out 1/4 turn. (c) With throttle valves in wide open position there should be 3/64 inch clearance between dashpot operating lever and stop. Adjust by bending stop (use tool T109-22).

Ignition Timing Breaker Points to Open 1951-53—T D C 1954—2° B T D C

Valve Setting (Hot) Intake 008" Exhaust 010"

Float Setting (Gauge T109-50) 5/64" ± 1/64"

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level Wear on lip of float lever will raise float level Before adjusting float be sure float lever pin is firmly seated Reset float level by bending lip of float lever away from needle to raise level or bend lip toward needle to lower float level Bend vertical lip of float only

If motor stalls while idling, set throttle lever adjusting screw so motor runs 450-500 r p m Then set idle adjustment screw to specifications If these adjustments do not correct the trouble remove idle orifice tube and plug assembly Clean tube passages with compressed air

If acceleration is not satisfactory, remove pump jet and clean with compressed air However, it is usually advisable to replace the pump jet, as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a 'balance tube" in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type size or condition of air cleaner Should the cleaner become clogged the capacity will be reduced but the air fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109 43 main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment No gauge is necessary Pump lifter arm should be at a right angle to pump lifter shaft Adjustment can be made by bending pump lifter arm up or down (use tool T109-41)

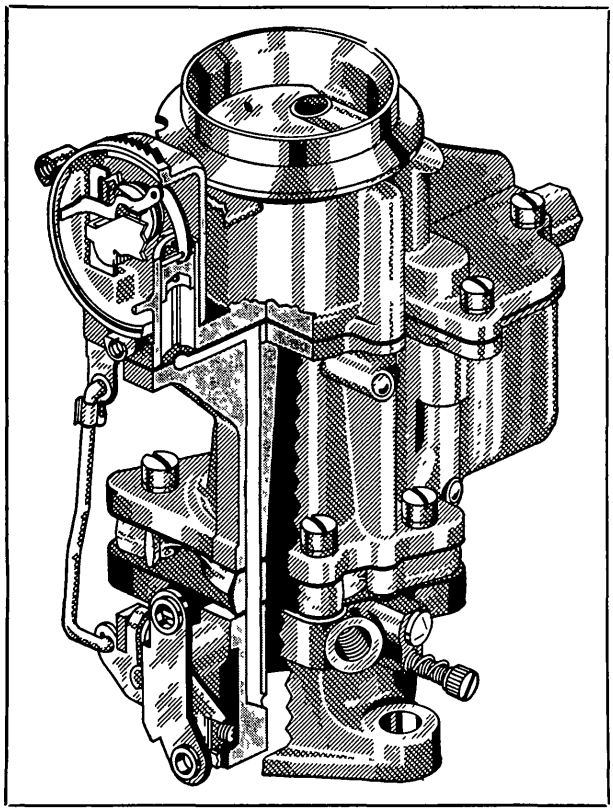

Figure 1

CARTER CLIMATIC® CONTROL CHOKE

The Carter Climatic® Control principle used in this unit is essentially the same as that used in WE type Carter carbureters. The fast idle cam assembly, unloader mechanism, etc., are located in the Climatic® Control housing. In this way all these parts are protected from dirt and other foreign matter. (Fig. 1) However, two important changes have been made Hot air is introduced at the **center** of the Climatic® Control housing, is drawn through three passages in the housing, around the delayer plate to the thermostatic coil, and then to the manifold

A **delayer plate** has been added to control the action of the choke, providing longer choke operation during warm-up and preventing the choke from closing too rapidly after the engine is shut off It should not be necessary to remove the delayer plate and thermostatic coil assembly from the coil housing when servicing the choke. The thermostatic coil **must not** be removed from the delayer plate

17. Delayer Plate and Thermostatic Coil Assembly

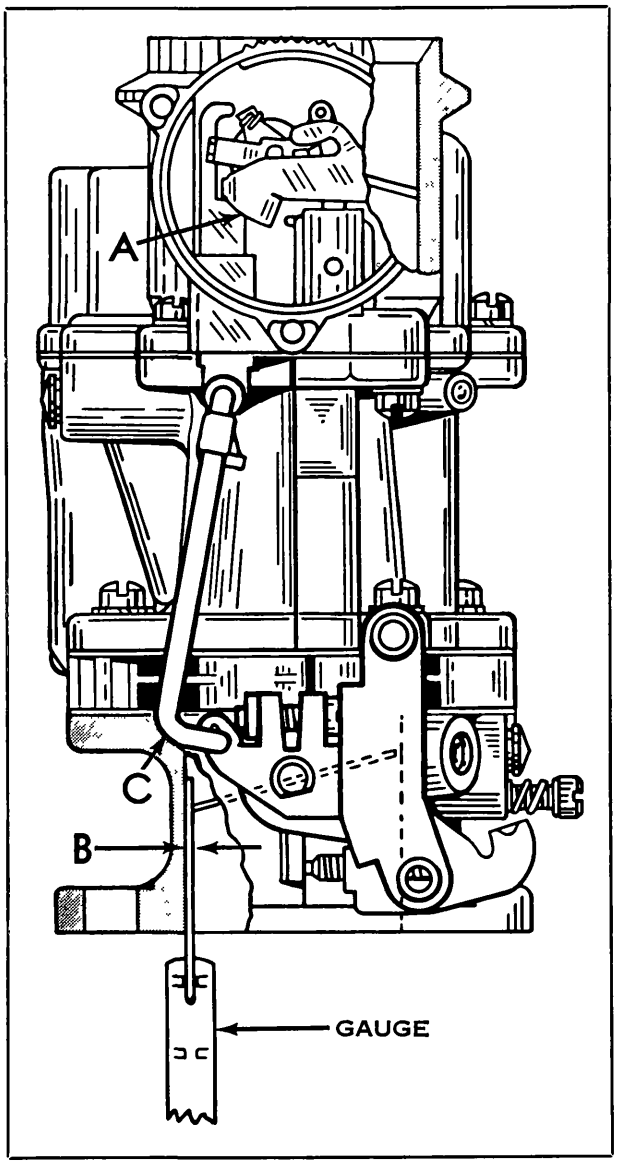

Figure 3
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 3):

Remove thermostatic coil housing assembly, gasket and baffle plate. With throttle adjusting screw backed out, crack throttle valve and hold choke valve in fully closed position. Then close throttle. This will allow fast idle cam to revolve to fast idle position ("A"—Fig. 3). There should now be .015"-.019" clearance (use gauge T109-44) between throttle valve and bore of carbureter, side opposite idle port ("B"-Fig. 3). Adjust by bending the choke connector rod at lower angle ("C"-Fig. 3) (use tool T109-41).

UNLOADER ADJUSTMENT (Fig. 4):

This adjustment must be made after the fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing. There should now be 5/32" clearance ("D"-Fig. 4) (use gauge T109-154) between upper edge of choke valve and inner wall of air horn. Adjust by bending arm on choke trip lever ("E"-Fig. 4) (use tool T109-187). When fast idle and unloader adjustments have been made assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn. Set Climatic® Control at "Index", making sure that hook on coil has picked up coil shaft lever.

WCD DOWN-DRAFT CLIMATIC® CONTROL **CARBURETER No. 979S**

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder Engine 3 13/16 Inch Bore 3⅝ Inch Stroke

Dimensions Flange size 1¼ inch S A E dual 4 bolt (water jacket) type
Throttle bore 1 7/16 inch
Primary venturi 11/32 inch I D
Main venturi 1 3/16 inch I D

Float Level See adjustments

Vents Inside None Outside Two—3/16 inch diameter vents in air horn

Gasoline Intake Size No 38 (1015 inch) drill hole in needle seat

Low Speed Jet Tube Jet size 0295 inch drill Bypass size No 58 (042 inch) drill Economizer size 0452 inch drill Idle bleed size No 58 (042 inch) drill

Idle Port Upper port length 175 inch width 030 inch

Idle Port Opening 136 to 140 inch above upper edge of valve with valve tightly closed

Lower Port (for Idle Adjustment Screw) Size 0615 to 0655 inch diameter

Set Idle Adjustment Screw ½ to 1 turn open For richer mixture turn screw out Idle engine at 500 r p m

Main Nozzle Nozzles are installed permanently Do not remove

Metering Rod Vacumeter type Economy step 0695 inch diameter Middle step tapers to 06675 inch diameter Power step 062 inch diameter

Metering Rod Jet 089 inch diameter

Metering Rod Setting See adjustments

Accelerating Pump Pump discharge jets (twin) size (0315 inch) drill Intake ball check seat size No 32 (116 inch) drill Discharge needle seat size No 50 (070 inch) drill

Pump Adjustment See adjustments

Choke Carter Climatic® Control—Set at index Butterfly type offset valve Choke heat suction hole in bowl cover size No 43 (089 inch) drill

Vacuum Spark Port 030 x 110 inch Top of port to be 035 to 041 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open	Float Setting	Idle Adjustment Screw Setting
035"	017"	4° B T D C At vibration damper	11/64" (Use Gauge T109-205)	½ to 1 Turn Open

NOTE These engines are equipped with hydraulic valve lifters—NO ADJUSTMENT

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vertical

Lateral Adjustment With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle place float gauge T109-205 directly under float with notched portions of gauge fitted over edges of casting Sides of floats should barely touch the vertical uprights of float gauge Adjustment should be made by bending arms of floats

Vertical Adjustment With float gauge in same position floats should just clear the horizontal portion of gauge Vertical distance between top of float and machined surface of casting should be 11/64 inch (gauge T109 205) Adjustment can be made by bending arms of floats Carefully remove float assembly, install bowl cover gasket and then reinstall float assembly Floats should have a free movement of ½ at free end of float Adjust by bending lip of float bracket A fast check of the fuel level can be made on the engine by removing the inspection hole plug in the side of carbureter body Fuel should just run out of the hole with engine idling

PUMP ADJUSTMENT The total distance the plunger head (not shaft) moves from closed to wide open throttle position determines the amount of fuel discharged Correct pump plunger travel is important and should be checked each time the carbureter is disassembled or when leaner than standard metering rods are installed Procedure is as follows Install pump connector link in outer hole (long stroke) of pump arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Be sure fast idle adjusting screw does not hold throttle open With air horn assembly removed place Universal pump travel gauge T109 117S inverted on edge of dust cover boss of bowl cover Turn knurled nut of gauge until finger just touches upper end of plunger shaft Number indicated on gauge should be 29 Hold the gauge vertical to insure correct reading Adjust by bending throttle connector rod at upper angle (Use tool T109-213)

Optional Adjustment With throttle valves seated in bores of carbureter the distance from the top of the plunger shaft to the top of the dust cover boss should be 17/64 Adjust as mentioned above

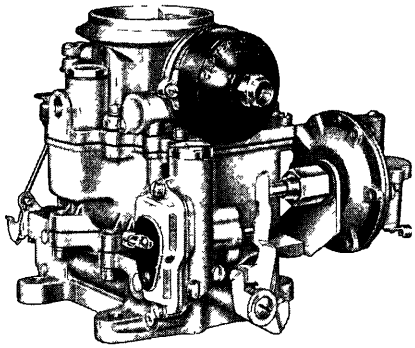
METERING ROD ADJUSTMENT. Metering rod adjustment is important and must be made after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows Backout throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw With metering rods in place press down on vacumeter link until metering rods bottom in carbureter body casting Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

FAST IDLE ADJUSTMENT 1 Loosen choke lever clamp screw on choke shaft Insert 040" feeler gauge T109-193 between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever toward closed position—hold in place and tighten clamp screw 2 With choke valve tightly closed tighten fast idle adjusting screw until there is 017"- 021" opening (wire gauge T109-44 may be used) between throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjusting screw is on high step of cam while making this adjustment



UNLOADER ADJUSTMENT: With throttle wide open there should be 7/32" clearance between upper edge of choke valve and inner wall of air horn (gauge T109-106) Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41)

NEW YORKER C-56
CUSTOM IMPERIAL C-58
1953

WCD DOWN-DRAFT CLIMATIC® CONTROL **CARBURETERS Nos. 935S-935SA**

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder Engine: 3-13/16 Inch Bore, 3⅝ Inch Stroke

Dimensions: Flange size 1¼ inch S. A. E. dual, 4 bolt (water jacket) type.
Throttle bore, 1-7/16 inch
Primary venturi, 11/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: See adjustments

Vents: Inside None. Outside Two—3/16 inch diameter vents in air horn.
Vent to kickdown switch in air horn on automatic choke side

Gasoline Intake: Size No 38 (.1015 inch) drill hole in needle seat.

Low Speed Jet Tube: Jet size .0295 inch drill Bypass, size No. 58 (.042 inch) drill. Economizer size 0452 inch drill. Idle bleed, size No. 58 (.042 inch) drill.

Idle Port: Upper port, length .175 inch; width .030 inch.

Idle Port Opening: .136 to .140 inch above upper edge of valve with valve tightly closed

Lower Port (for Idle Adjustment Screw): Size 0615 to 0655 inch diameter

Set Idle Adjustment Screw: ½ to 1 turn open. For richer mixture, turn screw out With gear shift lever in neutral position idle engine at 500 r.p.m.

Main Nozzle: Nozzles are installed permanently Do not remove

Metering Rod: Vacumeter type Economy step 0695 inch diameter Middle step tapers to 0665 inch diameter Power step 056 inch diameter These rods designed with stabilizing flats on economy step

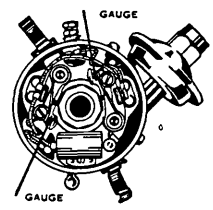
Metering Rod Jet: 089 inch diameter

Metering Rod Setting: See adjustments.

Accelerating Pump: Pump discharge jet: (twin) size 0315 inch drill Intake ball check seat, size No. 32 (.116 inch) drill Discharge needle seat size No. 50 (0.70 inch) drill.

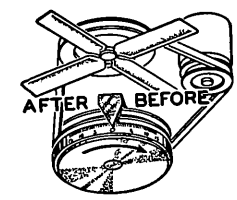
Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control—Set at index Butterfly type, offset valve Choke heat suction hole in bowl cover, size No 43 (.089 inch) drill

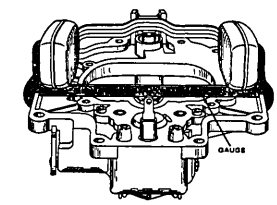


Vacuum Spark Port: 030 x 110 inch. Top of port to be 035 to 041 inch above top edge of valve, with valve tightly closed

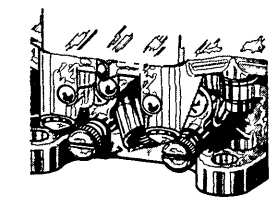
Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting .017"

Ignition Timing Breaker Points to Open: 4° B. T. D. C.

Float Setting See Adjustments

Idle Adjustment Screw Setting ½ to 1 Turn Open

NOTE: These cars are equipped with hydraulic valve lifters.—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical.

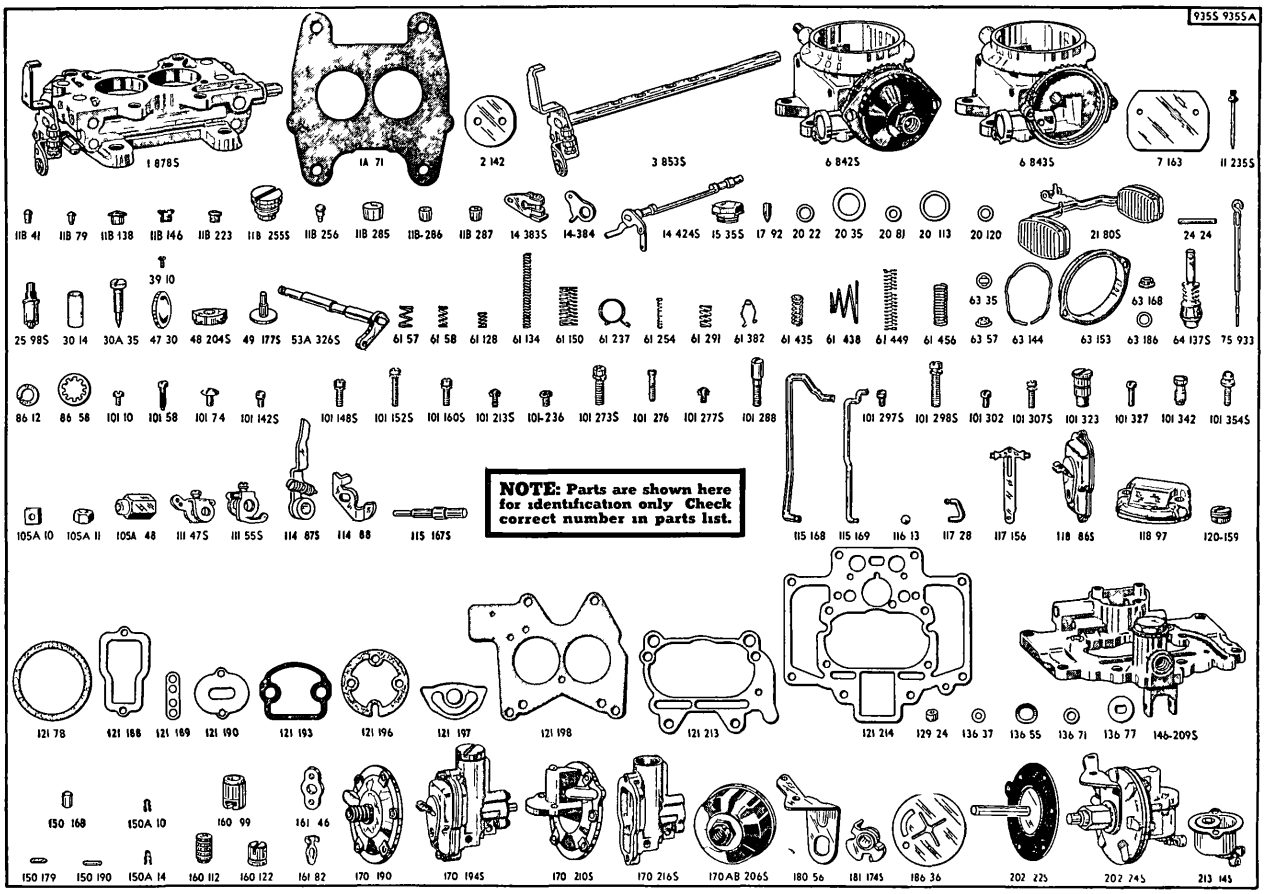
Lateral Adjustment: With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge T109-205 directly under float with notched portions of gauge fitted over edges of casting. Sides of floats should barely touch the vertical uprights of float gauge. Adjustment should be made by bending arms of floats.

Vertical Adjustment: With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting should be 11/64 inch (gauge T109-205). Adjustment can be made by bending arms of floats. Carefully remove float assembly, install bowl cover gasket and then reinstall float assembly. Floats should have a free movement of 1/2" at free end of float. Adjust by bending lip of float bracket. A fast check of the fuel level can be made on the car by removing the inspection hole plug in the side of carbureter body. Fuel should just run out of the hole with engine idling.

PUMP ADJUSTMENT: The total distance the plunger head (not shaft) moves from closed to wide open throttle position determines the amount of fuel discharged. Correct pump plunger travel is important and should be checked each time the carbureter is disassembled or when leaner than standard metering rods are installed. Procedure is as follows: Install pump connector link in outer hole (long stroke) of pump arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Be sure fast idle adjusting screw does not hold throttle open. With air horn assembly removed, place Universal pump travel gauge T109-117S, inverted on edge of dust cover boss of bowl cover. Turn knurled nut of gauge until finger just touches upper end of plunger shaft. Number indicated on gauge should be "29". Hold the gauge vertical to insure correct reading. Adjust by bending throttle connector rod at upper angle. (Use tool T109-213.)

Optional Adjustment: With throttle valves seated in bores of carbureter, the distance from the top of the plunger shaft to the top of the dust cover boss should be 17/64". Adjust as mentioned above.

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.



FAST IDLE ADJUSTMENT: 1. Loosen choke lever clamp screw on choke shaft. Insert .040" feeler gauge (T109-193) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever toward closed position — hold in place and tighten clamp screw. 2. With choke valve tightly closed, tighten fast idle adjusting screw until there is .017"-.021" opening (wire gauge T109-44 may be used) between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

UNLOADER ADJUSTMENT: With throttle wide open there should be 7/32" clearance between upper edge of choke valve and inner wall of air horn (gauge T109-106). Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

DASHPOT (SLOW CLOSING THROTTLE) ADJUSTMENT: The purpose of the dashpot is to prevent the car from stalling when the throttle is released rapidly. Maximum dashpot action is obtained by adjusting screw so that the dashpot plunger shaft can be moved inward approximately 1/16" after engine and throttle have returned to normal idle. This adjustment should be made with the carbureter on the car, with engine running and transmission in driving range.

Service parts and complete unit assemblies are available for servicing the dashpot and kickdown switch units.

CHRYSLER 6
MODEL C-51, C-60
(Fluid Drive and M6 Trans.)
1951-1953

BB DOWN-DRAFT **CARBURETER No. E9A1**

CARBURETER SPECIFICATIONS

For Chrysler 6 Cylinder Engine: 3-7/16 Inch Bore, 4½ Inch Stroke (1951)

For Chrysler 6 Cylinder Engine: 3-7/16 Inch Bore, 4¾ Inch Stroke (1952-53)

Dimensions: Flange size, 1½ inch S. A. E. Throttle bore, 1-11/16 inch (42.86 mm). Main venturi, 1-11/32 inch (34.13 mm) I. D.

Float Setting: Top of float 5/64 inch (1.98 mm) below top surface of carbureter body casting. Plus or minus 1/64 inch (.397 mm). (Gauge T109-50.)

Vents: Outside none. Inside balance vent tube in air horn, above choke valve.

Gasoline Intake Needle: No. 44 (2.18 mm) drill in needle seat.

Idle Orifice Tube: Jet size, .0295 inch (.75 mm) drill.
Idle passage air bleed, in air horn, size No. 56 (1.18 mm) drill diameter. Restriction in body .0492 inch (1.25 mm) diameter.

Idle Ports: Upper port. Slot type: length .149 inch (3.78 mm), width .030 inch (.76 mm). Top of port located .118 to .122 inch (3.00 to 3.10 mm) above top edge of valve.
Lower port size .053 to .057 inch (1.35 to 1.45 mm) drill. (For idle adjustment screw.)

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. With gear shift lever in neutral position, idle engine between 450 to 500 r.p.m.

Main Metering Screw: Calibrated to flow 315 to 319 cc per minute. (Do not gauge for size. If in doubt replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl). Size .0315 inch (.80 mm) drill.

Vent Tube: Side holes: 4—.0354 inch diameter.

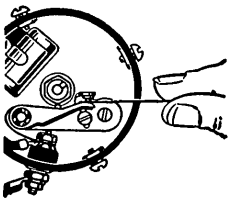
Step-Up Jet: Power orifice .0374 inch (.95 mm) drill.

Accelerating Pump: Type—delayed action, seasonal adjustment. Stroke—Summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke). Pump intake passage, ball check seat, size .107 to .112 inch (2.72 to 2.845 mm) diameter in body. Pump discharge passage: Restriction (under ball check) size .062 to .065 inch (1.57 to 1.65 mm) diameter in body. Pump (discharge) jet size, .0413 inch (1.05 mm) drill.

Pump Adjustment: None.

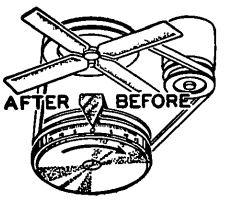
Choke: Carter Climatic® Control. Set at index. Choke heat suction hole, in flange insulator. Size No. 38 drill.

Slow Closing Throttle: Dash pot with discharge (by-pass), size .018 to .020 inch (.457 to .508 mm) drill, through valve cage.

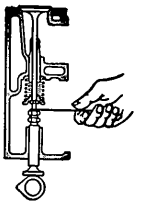


Vacuum Spark Port: Slot (round end) type; size .040 by .110 inch (1.016 by 2.794 mm). Top of port .012 to .018 inch (.305 to .457 mm) above top edge of valve.

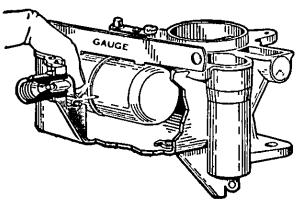
Motor Tune-Up—Be Accurate!



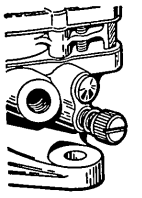
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open T. D. C.

Valve Setting (Hot) Intake .008" Exhaust .010"

Float Setting 5/64 Inch ± 1/64 Inch (Use Gauge T109-50)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs 450-500 r.p.m., with gear shift lever in neutral position. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube passages with compressed air.

If acceleration is not satisfactory, remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. All jets must be seated gasoline tight. Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage. If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather.

Correct air fuel ratio is provided by a "balance tube" in the air horn. The balance tube should be checked each time the carbureter is serviced to see that the passage is open. The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner. Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed.

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube. After removal of rivet plug beneath float bowl with tool No. T109-43, main vent tube can be removed and a new tube inserted with tool No. T109-195. Care must be exercised in inserting new tube which must seat tightly. Use new rivet to complete the installation.

Pump Adjustment: No gauge is necessary. Pump lifter arm should be at a right angle to pump lifter shaft. Adjustment can be made by bending pump lifter arm up or down (use tool T109-41).

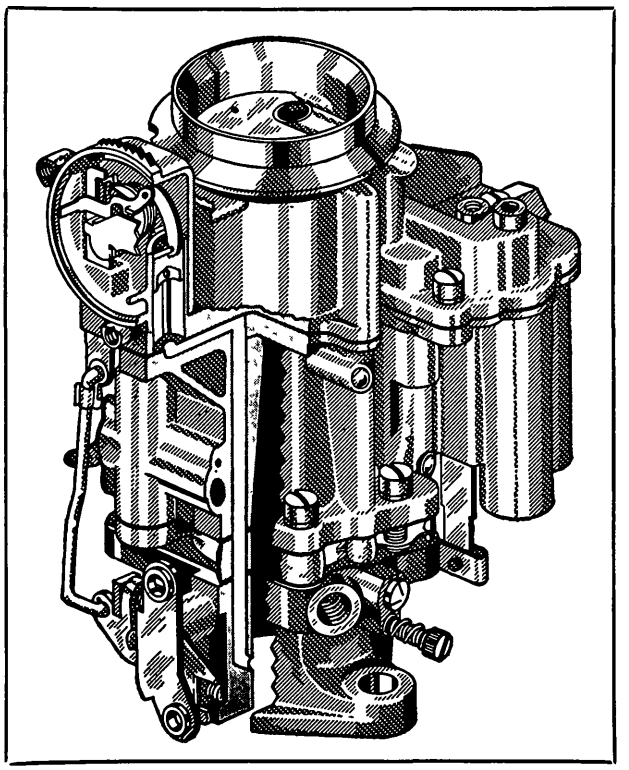

Figure 1

CARTER CLIMATIC® CONTROL CHOKE

The Carter Climatic® Control principle used in this unit is essentially the same as that used in WE type Carter carbureters. The fast idle cam assembly, unloader mechanism, etc., are located in the Climatic® Control housing. In this way all these parts are protected from dirt and other foreign matter (Fig. 1).

However, two important changes have been made (Fig. 2) Hot air is introduced at the **center** of the Climatic® Control housing, is drawn through three passages in the housing, around the delayer plate to the thermostatic coil, and then to the manifold.

A **delayer plate** has been added to control the action of the choke, providing longer choke operation during warm-up and preventing the choke from closing too rapidly after the engine is shut off. It should not be necessary to remove the delayer plate and thermostatic coil assembly from the coil housing when servicing the choke. The thermostatic coil **must not** be removed from the delayer plate.

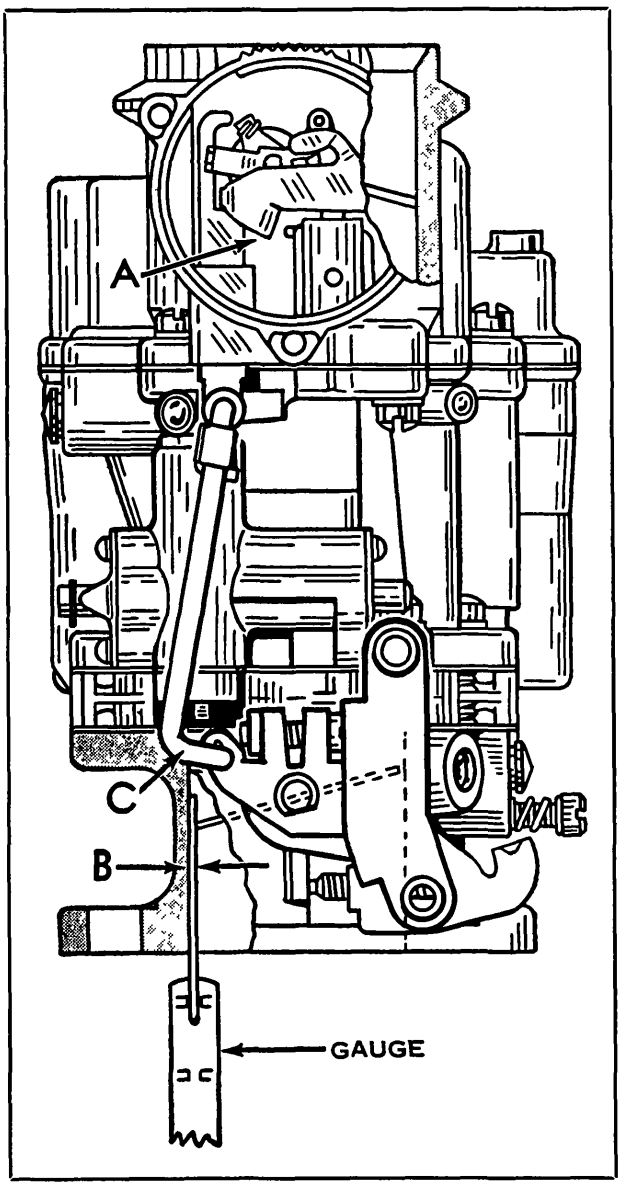

Figure 3
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 3):

Remove thermostatic coil housing assembly, gasket and baffle plate. With throttle adjusting screw backed out, crack throttle valve and hold choke valve in fully closed position. Then close throttle. This will allow fast idle cam to revolve to fast idle position ("A"—Fig. 3). There should now be .015"-.019" clearance ("B") (use gauge T109-44) between throttle valve and bore of carburetor, side opposite idle port. Adjust by bending the choke connector rod at lower angle ("C") (use tool T109-41).

UNLOADER ADJUSTMENT (Fig. 4):

This adjustment must be made after the fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing. There should now be 5/32" clearance ("D"—Fig. 4) (use gauge T109-154) between upper edge of choke valve and inner wall of air horn. Adjust by bending arm on choke trip lever ("E"—Fig. 4) (use tool T109-187). When fast idle and unloader adjustments have been made assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn Set Climatic® Control at "Index", making sure that hook on coil has picked up coil shaft lever.

WCD Down-Draft Climatic® Control **Carbureters Nos. 931S-931SA-931SB-931SC**

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder Engine 3 13/16 Inch Bore 3⅝ Inch Stroke

Dimensions Flange size 1¼ inch S A E dual 4 bolt (water jacket) type
Throttle bore 1 7/16 inch (36 51 mm)
Primary venturi 11/32 inch (8 73 mm) I D
Main venturi 1 3/16 inch (30 16 mm) I D

Float Level See adjustments

Vents (Early Production) Inside balance vent tube to bowl in air horn above choke valve Outside none (Late Production) Outside in air horn 2 holes size 3/16 inch (4 77mm)

Gasoline Intake Size No 38 (1015 inch) (2 58 mm) drill hole in needle seat

Low Speed Jet Tube Jet size 0295 inch (75 mm) drill By pass size No 58 (042 inch) (1 07 mm) drill Economizer size 0452 inch (1 15 mm) drill Idle bleed size No 58 (042 inch) (1 07 mm) drill

Idle Port Upper port length 175 inch (4 45 mm) width 030 inch (76 mm)

Idle Port Opening 136 to 140 inch (3 46 to 3 56 mm) above upper edge of valve with valve tightly closed

Lower Ports (for Idle Adjustment Screws) Size 0615 to 0655 inch (1 56 to 1 66 mm) diameter

Set Idle Adjustment Screw ½ to 1 turn open For richer mixture turn screw out With gear shift lever in neutral position idle engine at 500 r p m

Main Nozzle Nozzles are installed permanently **Do not remove**

Metering Rod Vacumeter type Economy step 0695 inch (1 77 mm) diameter Middle step tapers to 0667 inch (1 70 mm) diameter Power step 062 inch (1 58 mm) diameter These rods designed with idle stabilizing flats on economy step

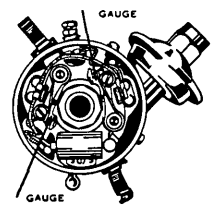
Metering Rod Jet 089 inch (2 26 mm) diameter

Metering Rod Setting See adjustments

Accelerating Pump Pump discharge jets (twin) size (0315 inch) (80 mm) drill Intake ball check seat size No 32 (116 inch) (2 95 mm) drill Discharge needle seat size No 50 (070 inch) (1 78 mm) drill

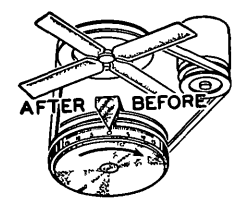
Pump Adjustment See adjustments

Choke Carter Climatic® Control—set at index Butterfly type offset valve Choke heat suction hole in bowl cover size No 43 (089 inch) (2 26 mm) drill

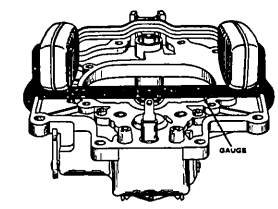


Vacuum Spark Port 030 x 110 inch (76 x 2 80 mm) Top of port to be 035 to 041 inch (89 to 1 04 mm) above top edge of valve

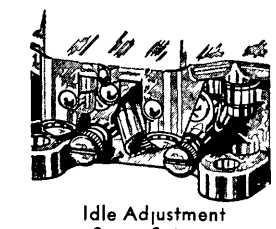
Motor Tune-Up—Be Accurate!



CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap 035"



Breaker Point Setting 017"

Ignition Timing Breaker Points to Open 4° B T D C

Float Setting 11/64" (Use gauge T109 205)

Idle Adjustment Screw Setting ½ to 1 Turn Open

NOTE These cars equipped with hydraulic valve lifters—No adjustment

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT (Fig. 1):

Two separate float adjustments must be made—lateral and vertical.

Lateral Adjustment: With bowl cover assembly inverted, bowl cover gasket removed and lip of float resting on seated needle, place float gauge T109-205 directly under float with notched portions of gauge fitted over edges of casting. Sides of floats should barely touch the vertical uprights of float gauge (A). Adjustment should be made by bending arms of floats.

Vertical Adjustment: With float gauge in position shown, floats should just clear the horizontal portion of gauge (B). Vertical distance between top of float and machined surface of casting should be 11/64 inch (gauge T109-205). Adjustment can be made by bending arms of floats. Carefully remove float assembly, install bowl cover gasket and then reinstall float assembly. Floats should have a free movement of 1/2" at free end of float. Adjust by bending lip of float bracket. A fast check of the fuel level can be made on the car by removing the inspection hole plug in the side of carbureter body. Fuel should just run out of the hole with engine idling.

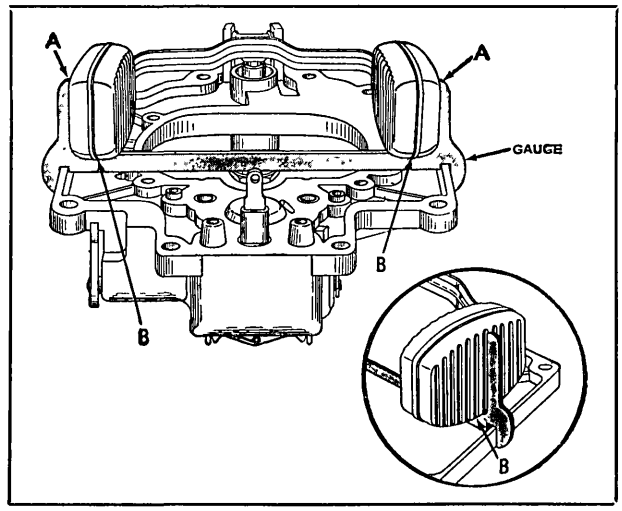

Figure 1
Float Adjustment

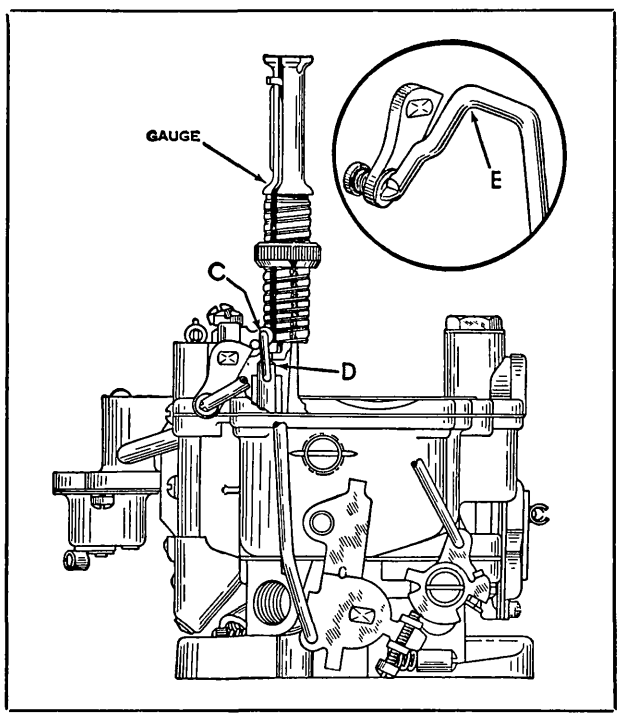

Figure 2
Pump Adjustment

PUMP ADJUSTMENT (Fig. 2):

The total distance the plunger head (not shaft) moves from closed to wide open throttle position determines the amount of fuel discharged. Correct pump plunger travel is important and should be checked each time the carbureter is disassembled or when leaner than standard metering rods are installed. Procedure is as follows: Install pump connector link in outer hole (long stroke) of pump arm (C). Back out throttle lever set screw until throttle valves seat in bores of carbureter. Be sure fast idle adjusting screw does not hold throttle open. With air horn assembly removed, place Universal pump travel gauge T109-117S, inverted on edge of dust cover boss of bowl cover. Turn knurled nut of gauge until finger just touches upper end of plunger shaft (D). Number indicated on gauge should be "29". Hold the gauge vertical to insure correct reading. Adjust by bending throttle connector rod at upper angle (E). (Use tool T109-213.)

Optional Adjustment: With throttle valves seated in bores of carbureter, the distance from the top of the plunger shaft to the top of the dust cover boss should be 17/64". Adjust as mentioned above.

METERING ROD ADJUSTMENT (Fig. 3):

Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (F). With metering rods in place, press down on vacumeter link (G) until metering rods bottom in carbureter body casting (H). Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link (J). Hold in place and carefully tighten clamp screw (F).

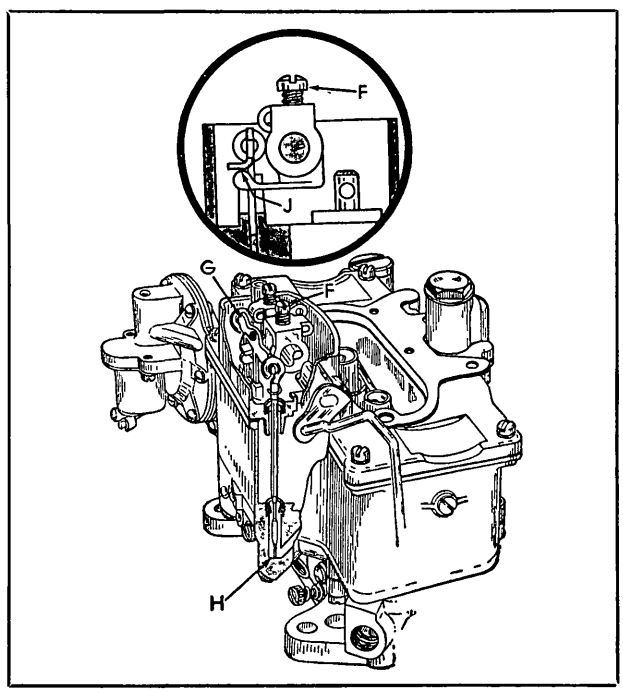

Figure 3
Metering Rod Adjustment

FAST IDLE ADJUSTMENT (Fig. 4):

1. Loosen choke lever clamp screw (K) on choke shaft. Insert .040" feeler gauge T109-193 between lip of fast idle cam and boss of flange casting (L). Hold choke valve tightly closed and take slack out of linkage by pressing choke lever toward closed position — hold in place and tighten clamp screw (K).

2. With choke valve tightly closed, tighten fast idle adjusting screw (M) until there is .017"-.021" opening (N) (wire gauge T109-44 may be used) between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam (O) while making this adjustment.

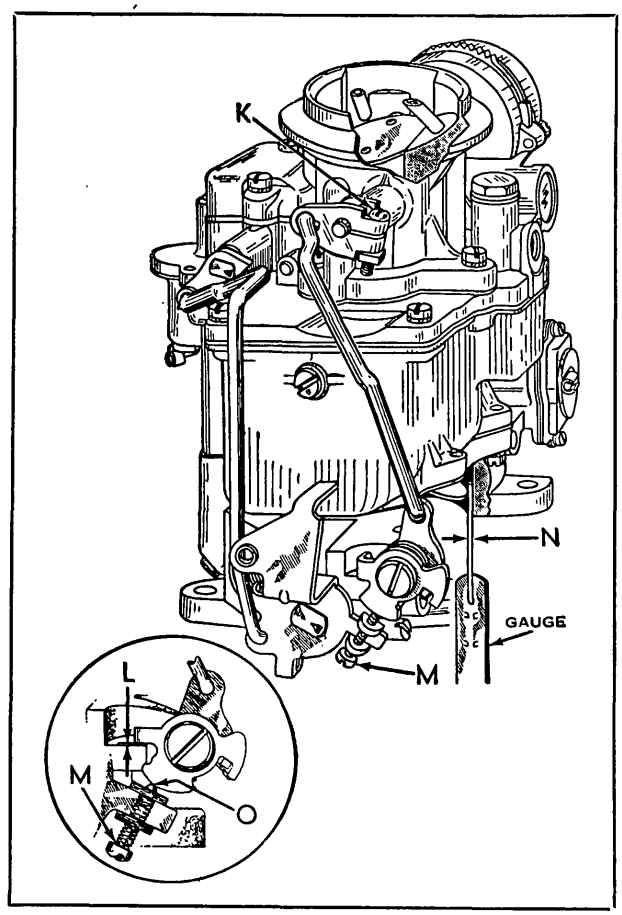

Figure 4
Fast Idle Adjustment

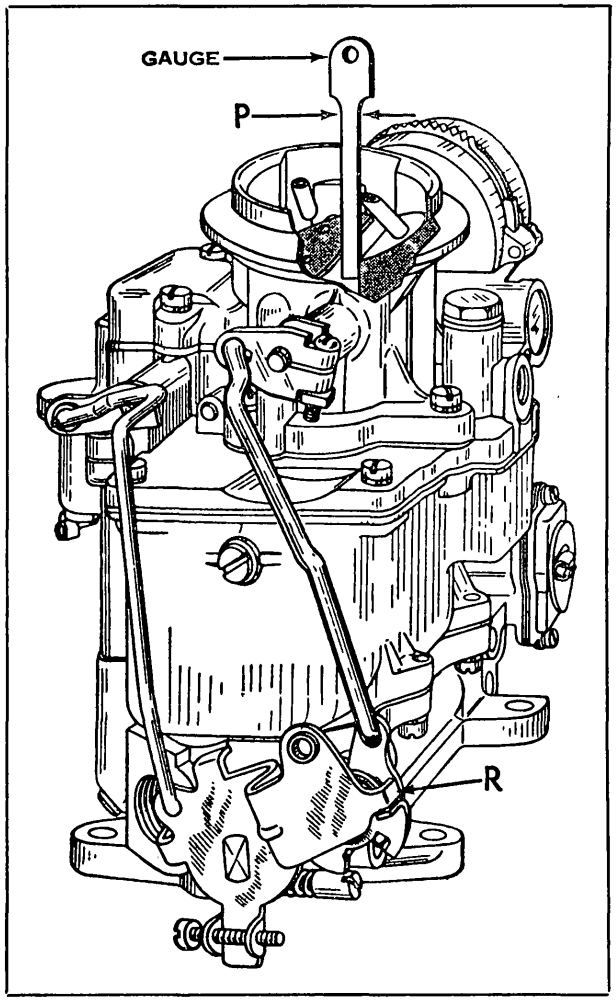

Figure 5
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 5):

With throttle wide open there should be 7/32" clearance between upper edge of choke valve and inner wall of air horn (P) (gauge T109-106). Adjust by bending unloader lip on throttle shaft lever (R) (use bending tool T109-41).

DASHPOT (SLOW CLOSING THROTTLE) ADJUSTMENT (Fig. 6):

The purpose of the dashpot is to prevent the car from stalling when the throttle is released rapidly. Maximum dashpot action is obtained by adjusting screw (S) so that the dashpot plunger shaft (T) can be moved inward approximately 1/16" after engine and throttle have turned to normal idle. This adjustment should be made with the carbureter on the car, with engine running and transmission in driving range.

Service parts and complete unit assemblies are available for servicing the dashpot and kickd wn switch units pictured in Fig. 6.

13 Delayer plate gasket
14 Delayer plate retainer ring
15 Delayer plate and thermostatic coil assembly

The Carter Climatic® Control principle used in this unit is essentially the same as that used in other WCD carbureters However heat is introduced at the center of the thermostatic coil housing Hot air is drawn through three passages in the coil housing through the center of the delayer plate and then to the manifold

The purpose of the delayer plate is to control the action of the choke providing longer choke operation during warm up and preventing the choke from closing too rapidly after the engine is shut off Should it be necessary to replace the delayer plate gasket the relayer plate and thermostatic coil assembly may be removed by striking the coil housing assembly sharply against the cupped palm of the hand Care should be taken during removal and reassembly to avoid damage to the thermostatic coil The thermostatic coil **must not** be removed from the delayer plate

CHRYSLER "V-8" MODELS C-52, C-53, C-54 1951

(931SC can also be used)

WCD Down-Draft Climatic® Control **Carbureters Nos. 830S-830SA-830SB**

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder Engine: 3-13/16 Inch Bore, 3⅝ Inch Stroke

Dimensions: Flange size 1¼ inch S. A. E. dual, 4 bolt (water jacket) type.
Throttle bore, 1-7/16 inch (36.51 mm).
Primary venturi, 11/32 inch, (8.73 mm) I. D.
Main venturi, 1-3/16 inch, (30.16 mm) I. D.

Float Level: See adjustments.

Vents: Inside; balance vent tubes (2) in air horn, above choke valve. Outside; none.

Gasoline Intake: Size No. 38 (.1015 inch) (2.58 mm) drill hole in needle seat.

Low Speed Jet Tube: Jet size .0295 inch (.75 mm) drill.
By-pass, size No. 58 (.042 inch) (1.07 mm) drill.
Economizer, size .0452 inch (1.15 mm) drill.
Idle bleed, size No. 58 (.042 inch) (1.07 mm) drill.

Idle Port: Upper port, length .175 inch (4.45 mm), width .030 inch (.76 mm).

Idle Port Opening: .136 to .140 inch (3.46 to 3.56 mm) above upper edge of valve with valve tightly closed.

Lower Ports (for Idle Adjustment Screws): Size .0615 to .0655 inch (1.56 to 1.66 mm) diameter.

Set Idle Adjustment Screw: ½ to 1 turn open. For richer mixture, turn screw out. With gear shift lever in neutral position, idle engine between 475 to 500 r.p.m.

Main Nozzle: Nozzles are installed permanently. **Do not remove.**

Metering Rod: Vacumeter type. Economy step .0665 inch (1.69 mm) diameter. Middle step tapers to .063 inch (1.60 mm) diameter. Power step, .058 inch (1.47 mm) diameter.

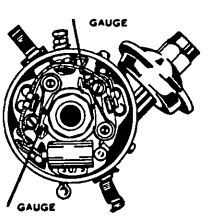
Metering Rod Jet: .089 inch (2.26 mm) diameter.

Metering Rod Setting: See adjustments.

Accelerating Pump: Pump discharge jets: (twin) size (.0315 inch) drill.
Intake ball check seat, size No. 32 (.116 inch) drill.
Discharge needle seat, size No. 50 (.070 inch) drill.

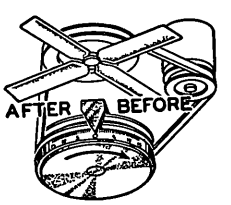
Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control—set at index. Butterfly type, offset valve. Choke heat suction hole, in bowl cover, size No. 43 (.089 inch) (2.26 mm) drill.

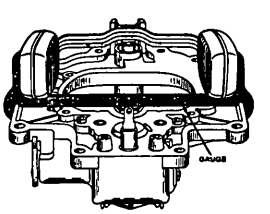


Vacuum Spark Port: .030 x .110 inch (.76 x 2.80 mm). Top of port to be (early production 830S) .067 to .073 inch (1.70 to 1.86 mm); (late production 830S and 830SA) .035 to .041 inch (.89 to 1.04 mm) above top edge of valve.

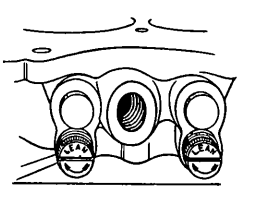
Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting .015"-.017"

Ignition Timing Breaker Points to Open: T. D. C.

Float Setting 11/64" (Use gauge T109-205)

Idle Adjustment Screw Setting ½ to 1 Turn Open

NOTE: These cars equipped with hydraulic valve lifters.—No adjustment.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT (Fig. 1):

Two separate float adjustments must be made—lateral and vertical.

Lateral Adjustment: With bowl cover assembly inverted, bowl cover gasket removed and lip of float resting on seated needle, place float gauge T109-205 directly under float with notched portions of gauge fitted over edges of casting. Sides of floats should barely touch the vertical uprights of float gauge (A). Adjustment should be made by bending arms of floats.

Vertical Adjustment: With float gauge in position shown, floats should just clear the horizontal portion of gauge (B). Vertical distance between top of float and machined surface of casting should be 11/64 inch (gauge T109-205). Adjustment can be made by bending arms of floats. Carefully remove float assembly, install bowl cover gasket and then reinstall float assembly.

Floats should have a free movement of 1/2" at free end of float. Adjust by bending lip of float bracket.

A fast check of the fuel level can be made on the car by removing the inspection hole plug in the side of carbureter body. Fuel should just run out of the hole with engine idling.

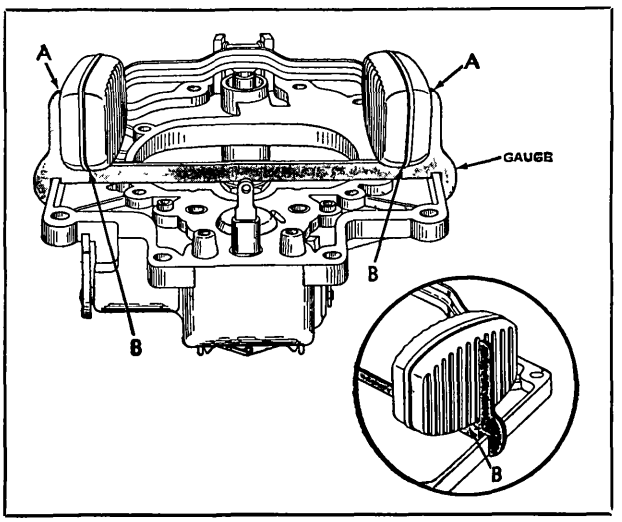

Figure 1
Float Adjustment

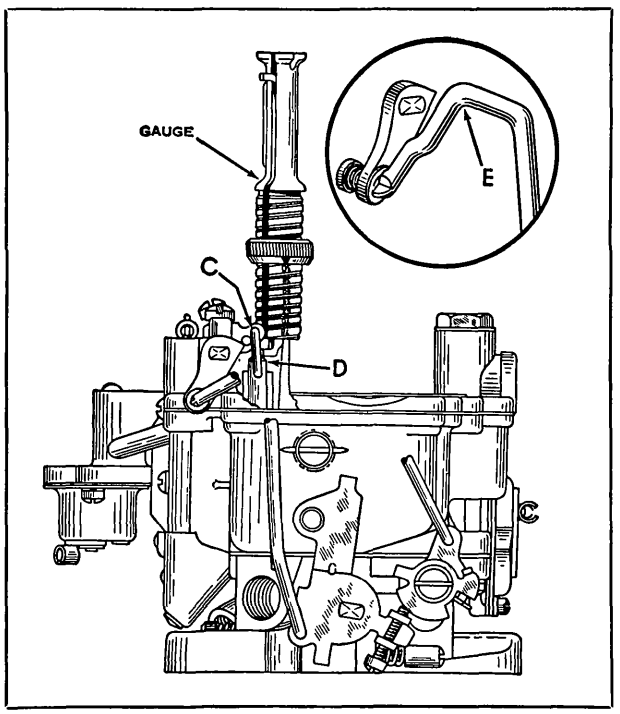

Figure 2
Pump Adjustment

PUMP ADJUSTMENT (Fig. 2):

The total distance the plunger head (not shaft) moves from closed to wide open throttle position determines the amount of fuel discharged. Correct pump plunger travel is important and should be checked each time the carbureter is disassembled or when leaner than standard metering rods are installed. Procedure is as follows:

Install pump connector link in outer hole (long stroke) of pump arm (C). Back out throttle lever set screw until throttle valves seat in bores of carbureter. Be sure fast idle adjusting screw does not hold throttle open. With air horn assembly removed, place universal pump travel gauge T109-117S, inverted on edge of dust cover boss of bowl cover. Turn knurled nut of gauge until finger just touches upper end of plunger shaft (D). Number indicated on gauge should be "29". Hold the gauge vertical to insure correct reading. Adjust by bending throttle connector rod at upper angle (E). (Use tool T109-213.)

Optional Adjustment: With throttle valves seated in bores of carbureter, the distance from the top of the plunger shaft to the top of the dust cover boss should be 17/64". Adjust as mentioned above.

METERING ROD ADJUSTMENT (Fig. 3):

Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows:

Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (F). With metering rods in place, press down on vacumeter link (G) until metering rods bottom in carbureter body casting (H). Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link (J). Hold in place and carefully tighten clamp screw (F).

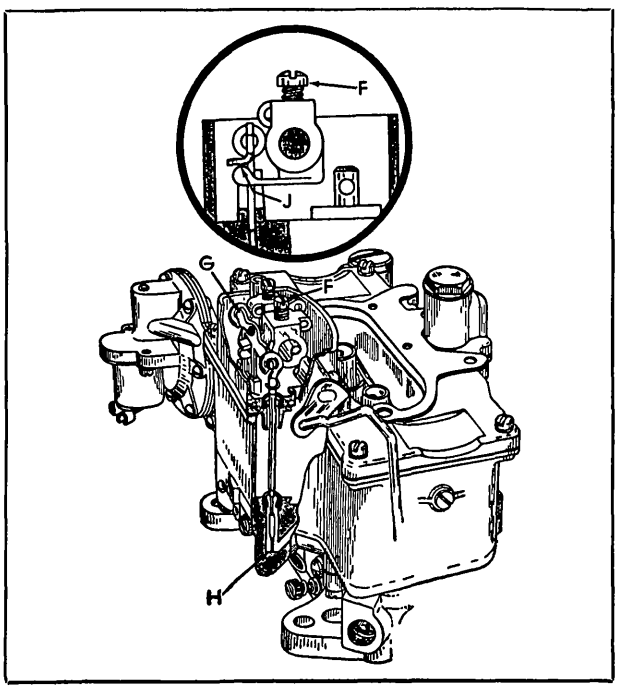

Figure 3
Metering Rod Adjustment

FAST IDLE ADJUSTMENT (Fig. 4):

1. Loosen choke lever clamp screw (K) on choke shaft. Insert .040" feeler gauge T109-193 between lip of fast idle cam and boss of flange casting (L). Hold choke valve tightly closed and take slack out of linkage by pressing choke lever toward closed position — hold in place and tighten clamp screw (K).

2. With choke valve tightly closed, tighten fast idle adjusting screw (M) until there is .017"-.021" opening (N) (wire gauge T109-44 may be used) between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam (O) while making this adjustment.

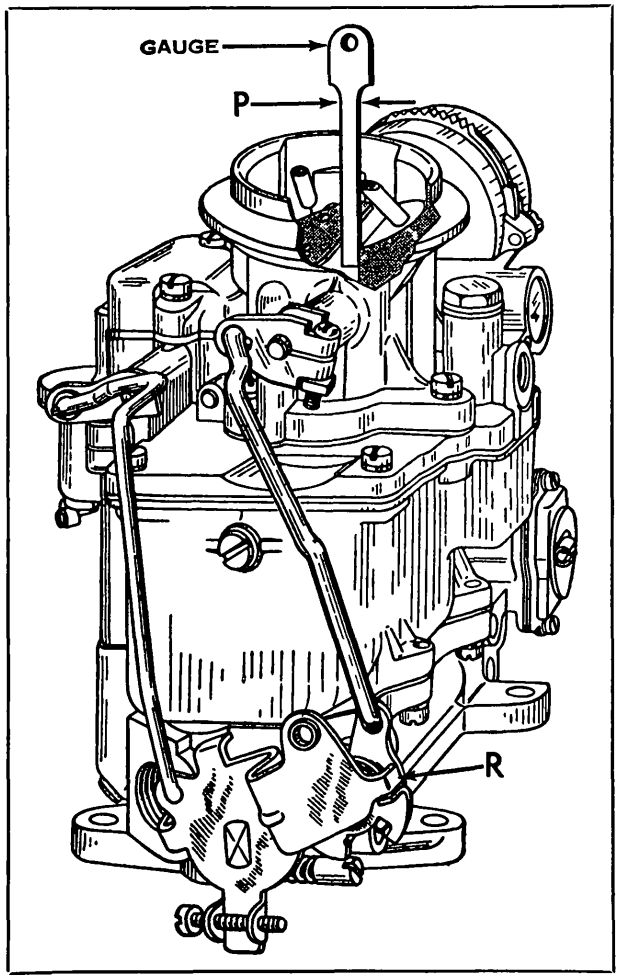

Figure 5
Unloader Adjustment

DASH POT (SLOW CLOSING THROTTLE) ADJUSTMENT (Fig. 6):

The purpose of the dashpot is to prevent the car from stalling when the throttle is released rapidly. Maximum dashpot action is obtained by adjusting screw (S) so that the dashpot plunger shaft (T) can be moved inward approximately 1/16" after engine and throttle have returned to normal idle. This adjustment should be made with the carbureter on the car, with engine running and transmission in driving range.

Service parts and complete unit assemblies are available for servicing the dashpot and kickdown switch units pictured in Fig. 6.

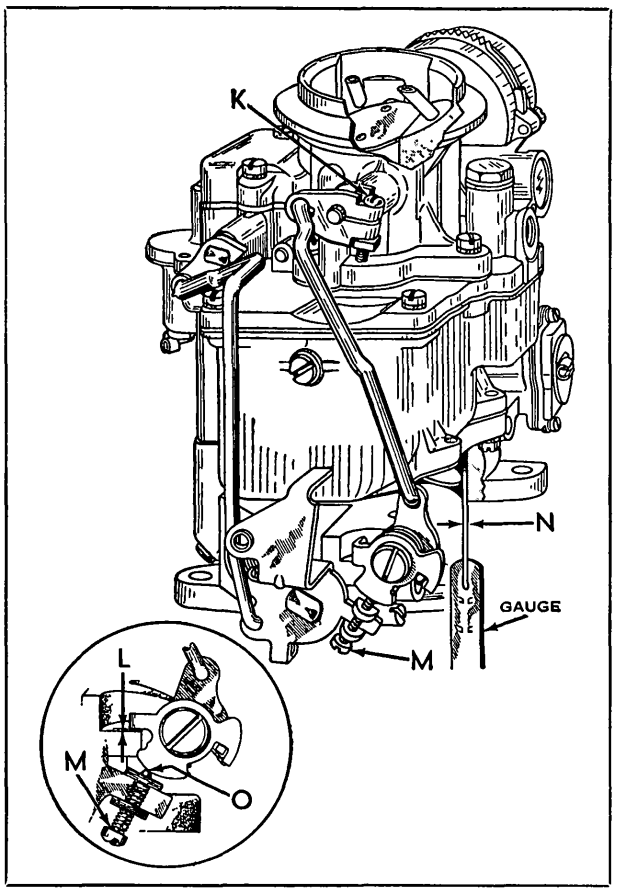

Figure 4
Fast Idle Adjustment

UNLOADER ADJUSTMENT (Fig. 5):

With throttle wide open there should be 7/32" clearance between upper edge of choke valve and inner wall of air horn (P) (gauge T109-106). Adjust by bending unloader lip on throttle shaft lever (R) (use bending tool T109-41).

13 Delayer plate gasket
14 Delayer plate retainer ring
15 Delayer plate and thermostatic coil assembly

The Carter Climatic® Control principle used in this unit is essentially the same as that used in other WCD carbureters However heat is introduced at the center of the thermostatic coil housing Hot air is drawn through three passages in the coil housing through the center of the delayer plate and then to the manifold

The purpose of the delayer plate is to control the action of the choke providing longer choke operation during warm up and preventing the choke from closing too rapidly after the engine is shut off Should it be necessary to replace the delayer plate gasket the delayer plate and thermostatic coil assembly may be removed by striking the coil housing assembly sharply against the cupped palm of the hand Care should be taken during removal and reassembly to avoid damage to the thermostatic coil The thermostatic coil **must not** be removed from the delayer plate

B-B DOWN-DRAFT CARBURETERS—**MODELS E7J1-E7J2-E7J3-E7J4**

CARBURETER SPECIFICATIONS

For Chrysler Eight Cylinder Engine: 3¼ Inch Bore, 4⅞ Inch Stroke

Dimensions: Flange size, 1½ inch (38.1 mm).
Throttle bore, 1-13/16 inch (46.04 mm).
Main venturi, 1⅜ inch (34.93 mm) I. D.

Float Setting: Top of float 5/64 inch (1.98 mm) below top surface of carbureter body casting. Plus or minus 1/64 inch (.397 mm).

Vents: Outside none. Inside balance vent .218 inch diameter (5.54 mm).

Gasoline Intake Needle: Triangular, horizontal No. 38 (2.58 mm) drill in needle seat.

Idle Orifice Tube: Jet size, .0276 inch (.70 mm) drill.
(E7J1) Idle passage air bleed, in body, size .063 inch (1.60 mm) diameter. Idle passage air bleed, in air horn, .063 inch (1.60 mm) diameter. Restriction in body, size .053 inch (1.35 mm) diameter.
(E7J2-J3-J4) Idle passage air bleed, in air horn, size .053 inch (1.35 mm) diameter. Restriction in body .057 inch (1.45 mm).

Idle Ports: Upper port, slot type: length .161 inch (4.09 mm); width .030 inch (.79 mm).
(E7J1) Top of port located .125 to .129 inch (3.175 to 3.275 mm) above top edge of valve.
(E7J2-J3-J4) Top of port located .130 to .134 inch (3.302 to 3.404 mm) above top edge of valve.
Lower port size .053 to .057 inch (1.35 to 1.45 mm) drill. (For idle adjustment screw.)

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. With gear shift lever in neutral position, idle engine between 450 to 500 r.p.m.

Main Metering Screw: Calibrated to flow 332 to 336 cc per minute. (Do not gauge for size. If in doubt replace with new part.) (10° included-tapered jet.)

Main Vent: Through diffuser (air bleed inside bowl). Size .0354 inch (.90 mm) drill.

Main Vent Tube: Side Holes: 4—.0354 inch diameter.

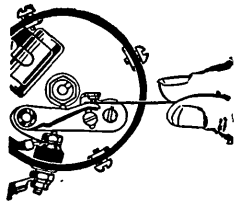
Step-Up Jet: (E7J1-J2-J3) Power orifice .0492 inch (1.25 mm) drill.
(E7J4) Power orifice .0433 (1.10 mm) drill.

Accelerating Pump: Type—delayed action.
Stroke—Summer setting (inner hole, short stroke).
Intermediate setting (center hole).
Winter setting (outer hole, long stroke).
Pump intake passage, size .115 to .120 inch (2.93 to 3.05 mm) diameter in body.
Pump discharge passage: Restriction (under ball check) size .062 to .065 inch (1.57 to 1.65 mm) diameter in body.
Pump (discharge) jet size, .0374 inch (.95 mm) drill.

Pump Adjustment: 26/64 inch plunger travel—full throttle position, medium stroke. Use gauge T109-117S.

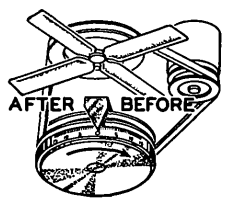
Choke: Offset butterfly type with poppet valve interconnected to open throttle valve to fast idle position when choke is used.

Slow Closing Throttle: Dash pot with discharge (By-pass), size .0197 inch (.5 mm) drill, through valve cage.

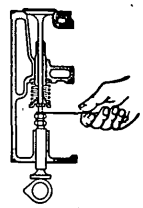


Vacuum Spark Port: Slot (round end) type; size .040 by .110 inch (1.016 by 2.794 mm). Top of port .052 to .058 inch (1.32 to 1.47 mm) above top edge of valve.

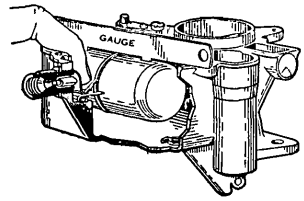
Motor Tune-Up—Be Accurate!



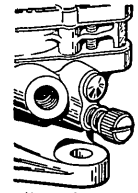
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .038"



Breaker Point Setting .018"



Ignition Timing Breaker Points to Open: 2° A. T. D. C.

Valve Setting (Hot) Intake .008" Exhaust .010"

Float Setting (Use Gauge) 5/64 Inch

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs between 450-500 r. p. m. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube passages with compressed air.

If acceleration is not satisfactory, remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. All jets must be seated gasoline tight. Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in dis-

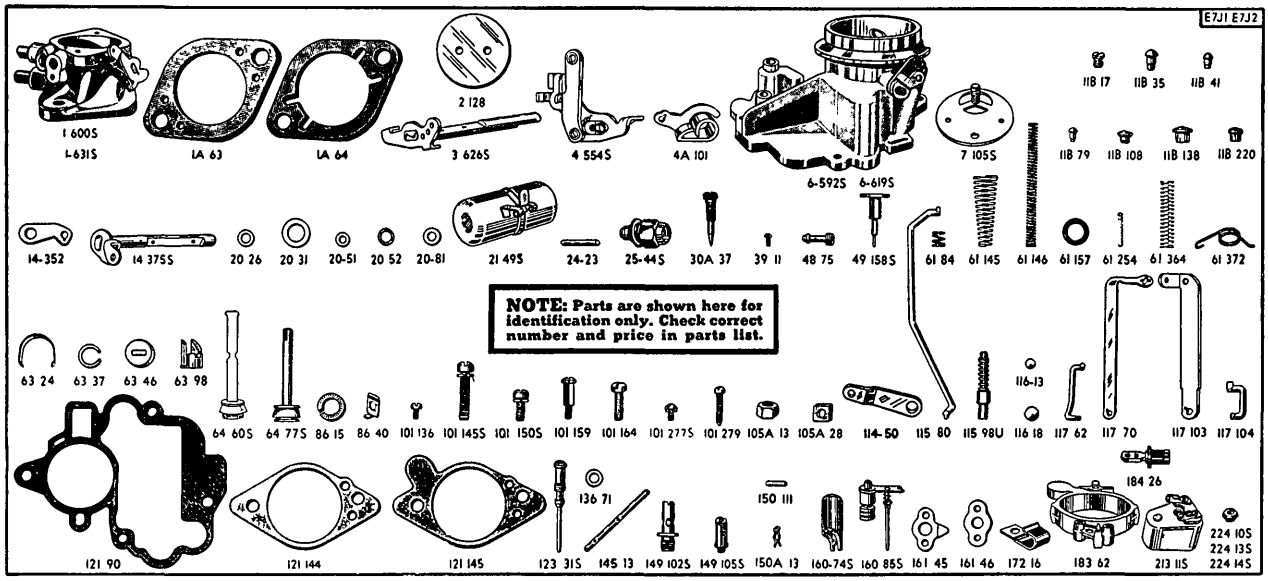
PRINTED IN U.S.A.



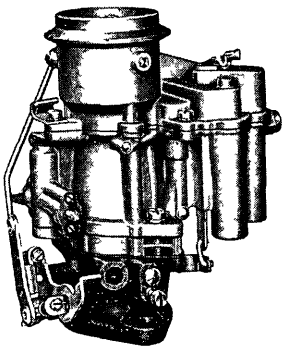
charge passage If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a "balance tube" in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43, main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment Remove air horn assembly, back out throttle adjustment screw, and place pump operating link in center hole of throttle shaft arm Place gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft Turn knurled nut of gauge until lip contacts plunger shaft at closed and wide open throttle positions Difference in readings obtained at closed and wide open throttle positions should be '26 (26/64) plunger travel Adjustments can be made by bending horizontal portion of pump lifter link

Pump stroke adjustable for high or low temperature Set to long stroke for cold weather, short stroke for hot weather driving



Chrysler—1949-50—Nos. E7J1-E7J2-E7J3-E7J4

WHEN SERVICING, USE GASKET ASSORTMENT No 194A, REPAIR PACKAGE No. 1511A

PART NAMES IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No.	PART NAME	
1-600S	Body flange assembly (E7J1)	
1-631S	Body flange assembly (Sup by 1-688S)	
1-688S	Body flange assembly (E7J2-J3-J4)	
1A-63	Flange gasket—for use with governor	
1A-64	FLANGE GASKET—FOR USE WITHOUT GOVERNOR	
2-128	Throttle valve	
3-626S	Throttle shaft and arm assembly	
4-546S	Throttle lever assembly	
4A-101	Fast idle cam	
6-592S	Air horn assembly (E7J1)	
6-619S	Air horn assembly (E7J2-J3-J4)	
7-105S	Choke valve assembly	
11B-17	Pump discharge passage plug	
11B-35	Rivet passage plug	
11B-41	Rivet passage plug	
11B-79	Rivet passage plug	(3)
11B-108	IDLE PORT RIVET PLUG	
11B-138	PUMP JET RIVET PLUG	
11B-220	HIGH SPEED PASSAGE PLUG	
14-352	Choke lever (loose)	
14-375S	Choke lever and shaft assembly

B-B DOWN-DRAFT CARBURETERS—**MODELS E7L1-L2-L3-L4**

CARBURETER SPECIFICATIONS

For Chrysler Six Cylinder Engine 3 7/16 Inch Bore, 4¾ Inch Stroke

Dimensions Flange size 1½ inch (38 1 mm)
Throttle bore 1 11/16 inch (42 86 mm)
Main venturi 1 11/32 inch (34 13 mm) I D

Float Setting Top of float 5/64 inch (1 98 mm) below top surface of carbureter body casting Plus or minus 1/64 inch (397 mm)

Vents Outside none Inside balance vent tube 218 inch diam eter (5 54 mm)

Gasoline Intake Needle Triangular horizontal No 44 (2 18 mm) drill in needle seat

Idle Orifice Tube Jet size 0276 inch (70 mm) drill (E7L1) Idle passage air bleed in air horn size 0531 inch (1 35 mm) diameter Restriction in body size 0531 inch (1 35 mm) diameter (E7L2 L3 L4) Idle passage air bleed in air horn size No 56 (1 18 mm) drill diameter Restriction in body 0452 inch (1 15 mm) diameter

Idle Ports Upper port Slot type length 149 inch (3 78 mm) width 030 inch (76 mm) Top of port located 118 to 122 inch (3 00 to 3 10 mm) above top edge of valve Lower port size 053 to 057 inch (1 35 to 1 45 mm) drill (For idle ad justment screw)

Set Idle Adjustment Screw ½ to 1½ turns open For richer mixture turn screw out With gear shift lever in neutral posi tion idle engine between 450 to 500 r p m

Main Metering Screw Calibrated to flow 315 to 319 cc per minute (Do not gauge for size If in doubt replace with new part)

Main Vent Through diffuser (air bleed inside bowl) Size 0315 inch (80 mm) drill

Main Vent Tube Side Holes 4—0354 inch diameter

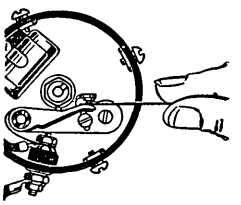
Step Up Jet Power orifice 0413 inch (1 05 mm) drill

Accelerating Pump Type—delayed action seasonal adjustment Stroke—Summer setting (inner hole short stroke) Interme diate setting (center hole) Winter setting (outer hole long stroke)
Pump intake passage ball check seat size 115 to 120 inch (2 93 to 3 05 mm) diameter in body Pump discharge passage Restriction (under ball check) size 062 to 065 inch (1 57 to 1 65 mm) diameter in body Pump (discharge) jet size (E7L1 L2) 0334 inch (85 mm) drill Pump (discharge) jet size (E7L3 L4) 0413 inch (1 05 mm) drill

Pump Adjustment (E7L1 L2) 20/64 inch plunger travel—full throttle position medium stroke Use gauge T109 117S (E7L3 L4) None

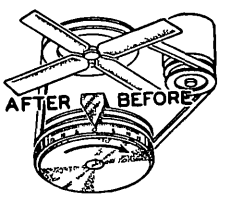
Choke Offset butterfly type (with poppet valve) interconnected to open throttle valve to fast idle position when choke is used

Slow Closing Throttle Dash pot with discharge (By pass) size 018 to 020 inch (457 to 508 mm) drill through valve cage.

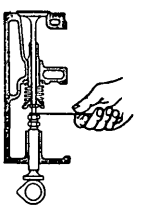


Vacuum Spark Port Slot (round end) type size 040 by 110 inch (1 016 by 2 794 mm) Top of port 052 to 058 inch (1 32 to 1 47 mm) above top edge of valve (early prod); 012 to 018 inch (305 to 457 mm) above top edge of valve (late prod)

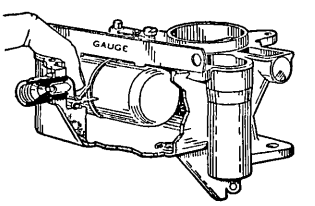
Motor Tune-Up—Be Accurate!



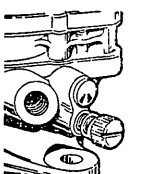
CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap 038"



Breaker Point Setting 020"



Ignition Timing Breaker Points to Open T D C

Valve Setting (Hot) Intake 008" Exhaust 010"

Float Setting (Use Gauge) 5/64 Inch

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service check float level Wear on lip of float lever will raise float level Before adjusting float, be sure float lever pin is firmly seated Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level Bend vertical lip of float only

If motor stalls while idling set throttle lever adjusting screw so motor runs 450-500 r p m with gear shift lever in neutral position Then set idle adjustment screw to specifica tions If these adjustments do not correct the trouble re move idle orifice tube and plug assembly Clean tube pas sages with compressed air

If acceleration is not satisfactory, remove pump jet and clean with compressed air However it is usually advisable to replace the pump jet, as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in dis-charge passage If plunger is removed from cylinder use care in installing to avoid damage to plunger leather

Casting No. 263 on face of flange

B-B Down-Draft Carbureters—**Models EX1-EX2-EX3-EX1R-EX2R-EX3R**

CARBURETER SPECIFICATIONS

For Chrysler Six Cylinder Engine: 3-7/16 Inch Bore, 4½ Inch Stroke

Dimensions: Flange size, 1½ inch (38.1 mm). Throttle bore, 1-11/16 inch (42.86 mm). Main venturi, 1-11/32 inch (34.13 mm) I. D.

Float Setting: Top of float 5/64 inch (1.98 mm) below top surface of carbureter body casting. Plus or minus 1/64 inch (.397 mm).

Vents: Outside, none. Inside, balance vent tube .218 inch diameter (5.54 mm).

Gasoline Intake Needle: Triangular, horizontal No. 44 (2.18 mm) drill in needle seat.

Idle Orifice Tube: Jet size .0276 inch (.70 mm) drill. Idle passage air bleed, in body, size .063 inch (1.60 mm) diameter (EX1-EX2-EX1R-EX2R). Idle passage air bleed, in air horn, size .0465 inch (1.18 mm) diameter (EX3-EX3R). Restriction in body, size .053 inch (1.35 mm) diameter (EX1-EX2-EX1R-EX2R), size .0452 inch (1.15 mm) diameter (EX3-EX3R).

Idle Ports: Upper port. Keyhole type: length, .128 inch (3.25 mm); width .027 inch (.69 mm). .063 inch (1.60 mm) diameter hole at top (EX1-EX2-EX1R-EX2R). Slot type: length .149 inch (3.78 mm); width .030 inch (.76 mm) (EX3-EX3R). Top of port located .088 to .092 inch (2.24 to 2.34 mm) (EX1-EX2-EX1R-EX2R), and .118 to .122 inch (3.00 to 3.10 mm) (EX3-EX3R) above top edge of valve. Lower port size .053 to .057 inch (1.35 to 1.45 mm) drill. (For idle adjustment screw.)

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. Idle engine between 450 and 500 r.p.m.

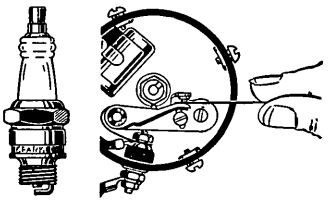
Main Metering Screw: Calibrated to flow 312 to 316 cc per minute (EX1-EX2-EX1R-EX2R); 315 to 319 cc per minute (EX3-EX3R). (Do not gauge for size. If in doubt replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl). Size .0315 inch (.80 mm) drill.

Main Vent Tube: Side holes, 4—.0354 inch diameter.

Step-Up Jet: Power orifice .0413 inch (1.05 mm) drill.

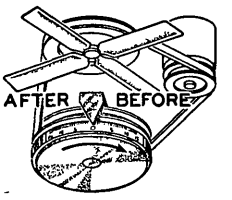
Accelerating Pump: Type—delayed action, seasonal adjustment. Stroke—Summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke). Pump intake passage ball check seat, size .107 to .112 inch (2.72 to 2.85 mm) diameter in body. Pump discharge passage: Restriction (under ball check) size .062 to .065 inch (1.57 to 1.65 mm) diameter in body. Pump (discharge) jet size, .0374 inch (.95 mm) drill 48-75 (EX1-EX1R); .0334 inch (.85 mm) drill 48-145 (EX2-EX2R); .0413 (1.05 mm) drill 48-167 (EX3-EX3R).



Pump Adjustment: 26/64 inch plunger travel (early production), 20/64 inch plunger travel (late production)—full throttle position, medium stroke. Use gauge T109-117S (EX1-EX2-EX1R-EX2R). Pump adjustment (EX3-EX3R): None.

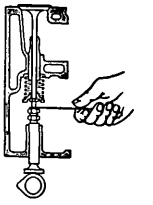
Choke: Offset butterfly type (with poppet valve) interconnected to open throttle valve to fast idle position when choke is used.

Vacuum Spark Port: Slot (round end) type; size .040 by .110 inch (1.016 by 2.794 mm). Top of port .052 to .058 inch (1.32 to 1.47 mm) above top edge of valve.

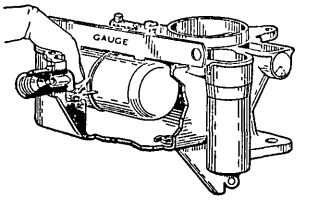


Motor Tune-Up—Be Accurate!

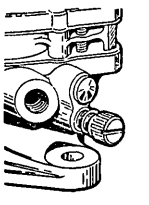
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .030"



Breaker Point Setting .017"-.019"



Ignition Timing Breaker Points to Open 2° B. T. D. C.

Valve Setting (Hot) Intake .008" Exhaust .010"

Float Setting (Use Gauge) 5/64 Inch

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 300 r. p. m. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube and passages with compressed air.

If acceleration is not satisfactory remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. All jets must be seated gasoline tight. Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage. If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather.

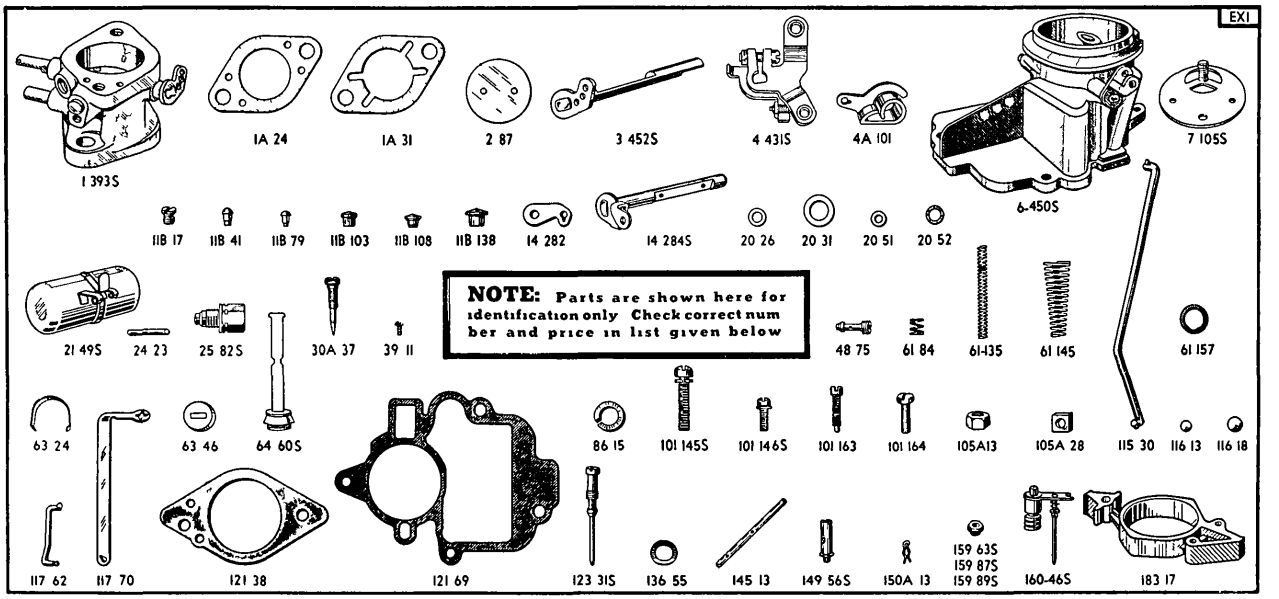
CARBURETER



TRADE MARK REG. U. S. PAT. FF.
MARCA REGISTRADA

PRINTED IN U.S.A.

Correct air fuel ratio is provided by a "balance tube' in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43, main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment Remove air horn assembly, back out throttle lever adjustment screw and install pump operating link in center hole of throttle shaft arm Place pump travel gauge T109-117S on upper surface of body casting with lip of gauge extending over top of plunger shaft Turn knurled nut of gauge until lip rests on top of plunger shaft Difference in readings obtained at closed and wide open throttle should be '26 (early production) "20' (late production) Adjustment can be made by bending horizontal portion of pump lifter link

CHRYSLER "8" MODELS "C39"-"C40"

FLUID DRIVE &
VACAMATIC TRANSMISSION

1946-47-48

B-B DOWN-DRAFT CARBURETER—**MODEL E7A1**

CARBURETER SPECIFICATIONS

For Chrysler Eight Cylinder Engine: 3¼ Inch Bore, 4⅞ Inch Stroke

Dimensions: Flange size 1½ inch (38 1 mm)
Throttle bore, 1-11/16 inch (42 86 mm)
Main venturi, 1-11/32 inch (34 13 mm) I D

Float Setting: Top of float 1/16 inch (1 59 mm) below top surface of carbureter body casting (Plus or minus 1/64 inch (397 mm)

Vent: Outside none Inside balance vent 218 inch diameter (5 54 mm)

Gasoline Intake Needle: Triangular horizontal No 38 (2 58 mm) drill in needle seat

Idle Orifice Tube: Jet size 0276 inch (70 mm) drill Idle passage air bleed in body, size 063 inch (1 60 mm) diameter Restriction in body size 053 inch (1 35 mm) diameter

Idle Ports: Upper port Keyhole type length 128 inch (3 25 mm), width 027 inch (69 mm) 063 inch (1 60 mm) diameter hole at top Top of port located 088 to 092 inch (2 24 to 2 34 mm) above top edge of valve (early production), 093 to 097 inch (2 36 to 2 46 mm) above top edge of valve (late production)
Lower port size 053 to 057 inch (1 35 to 1 45 mm) drill (For idle adjustment screw)

Set Idle Adjustment Screw: ¾ to 1¼ turns open For richer mixture turn screw out Do not idle engine below 300 r p m or 6 miles per hour

Main Metering Screw: Calibrated to flow 312 to 316 cc per minute (Do not gauge for size If in doubt replace with new part)

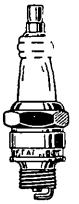
Main Vent: Through diffuser (air bleed inside bowl) Size 0315 inch (80 mm) drill

Main Vent Tube: Side Holes 4—0354 inch diameter

Step-Up Jet: Power orifice 0413 inch (1 05 mm) drill

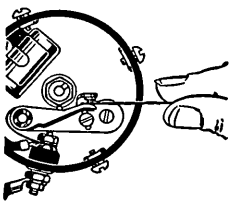
Accelerating Pump: Type—delayed action
Stroke—Summer setting (inner hole short stroke)
Intermediate setting (center hole)
Winter setting (outer hole, long stroke)
Pump intake passage size 115 to 120 inch (2 93 to 3 05 mm) diameter in body
Pump discharge passage Restriction (under ball check) size 062 to 065 inch (1 57 to 1 65 mm) diameter in body
Pump (discharge) jet size 0374 inch (95 mm) drill

Pump Adjustment: 26/64 inch plunger travel—full throttle position medium stroke Use gauge T109-117S



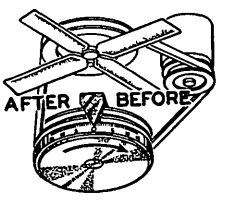
Choke: Offset butterfly type with poppet valve inter connected to open throttle valve to fast idle position when choke is used

Slow Closing Throttle: Dash pot with discharge (By pass) size 0197 (5 mm) drill through valve cage

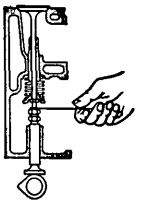


Vacuum Spark Port: Slot (round end) type, size 040 by 110 inch (1 016 by 2 794 mm) Top of port 052 to 058 inch (1 32 to 1 47 mm) above top edge of valve

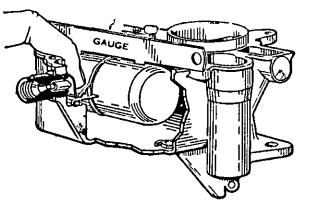
Motor Tune-Up—Be Accurate!



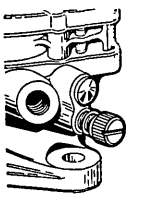
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap .030"



Breaker Point Setting .018"



Ignition Timing Breaker Points to Open: 2° A. T. D. C

Valve Setting (Hot) Intake .008" Exhaust .010"

Float Setting (Use Gauge) 1/16 Inch

Idle Adjustment Screw Setting ¾ to 1¼ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. To adjust float level, bend vertical lip of float assembly toward needle to lower, or away from needle to raise

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 300 r p m Then set idle adjustment screw to specifications If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly Clean tube and passages with compressed air

If acceleration is not satisfactory, remove pump jet and clean with compressed air However, it is usually advisable to replace the pump jet as its cost is nominal. All jets must be seated gasoline tight

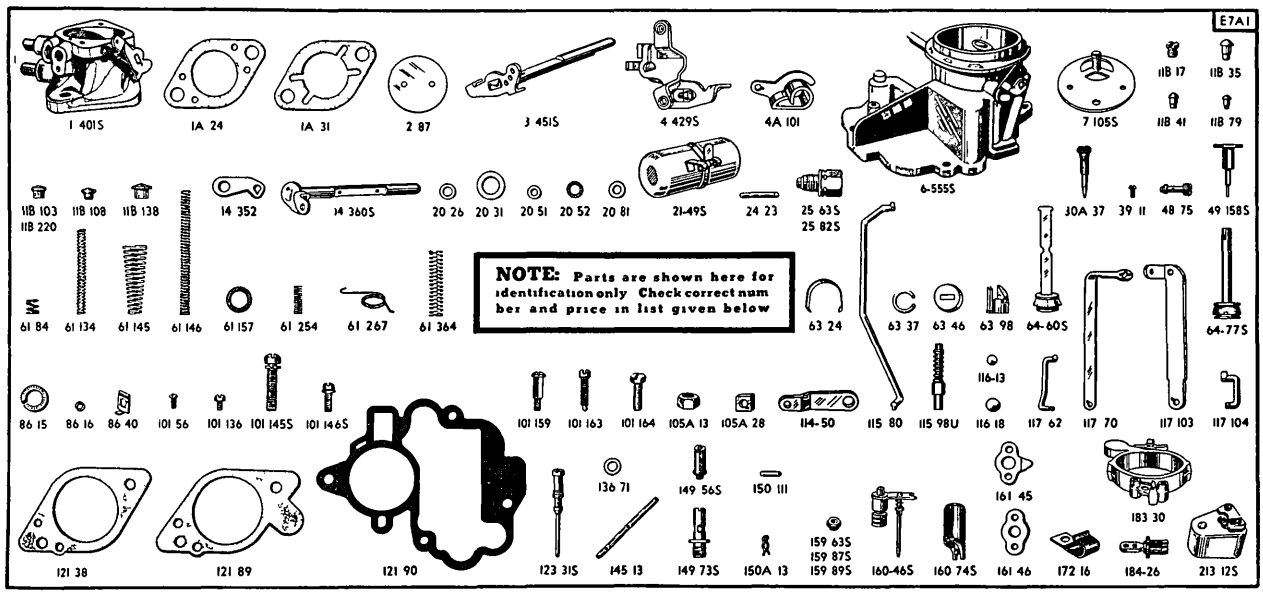
PRINTED IN U.S.A.



Poor acceleration may be due to damaged or worn plunger leather in accelerating pump or pump check balls not seating properly If plunger is removed from cylinder, use care when installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a 'balance tube" in the air horn The 'balance tube' and vent passage must not be restricted The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner becomes clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43 main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment Remove air horn assembly, back out throttle lever adjustment screw and locate pump link in center hole of throttle shaft arm Place universal pump travel gauge T109-117S on edge of bowl so that lip of gauge extends over top of plunger shaft Turn knurled nut of gauge until lip contacts top of plunger shaft at closed throttle position Take reading indicated on gauge Repeat with throttle wide open Difference in readings obtained should be "26 (26/64" plunger travel) Adjustment may be made by bending horizontal portion of pump lifter link

Seasonal Pump Adjustment Three holes are provided in pump arm to meet seasonal or climatic conditions For high altitudes or extreme heat, use short stroke (inner hole), winter setting long stroke (outer hole) or intermediate stroke (center hole)

B-B DOWN-DRAFT CARBURETERS—**Nos. EM1-EM2-EM3-EM4**

CARBURETER SPECIFICATIONS

For Chrysler 6 Cyl Engine 3-7/16 Inch Bore, 4¼ Inch Stroke
For Chrysler 8 Cyl Engine 3¼ Inch Bore 4⅞ Inch Stroke

Dimensions Flange size 1½ inch S A E
Throttle bore 1 11/16 inch (42 86 mm)
Main venturi 1 11/32 inch (3 413 mm)

Float Setting Top of float 5/64 inch (1 98 mm) plus or minus 1/64 inch (397 mm) below top surface of carbureter body casting

Vents Outside none Inside balance vent tube 218 inch (5 56 mm) inside diameter

Gasoline Intake Needle Triangular horizontal needle seat hole No 44 (2 18 mm) drill

Idle Orifice Tube Jet size 0276 inch (70 mm)
Idle passage air bleed (in air horn) size 0688 inch (1 75 mm)
Idle restriction in body size 059 inch (1 50 mm)

Idle Ports Upper port slot type Length 128 inch (3 251 mm)
Width 027 inch (686 mm)
Top of port 088 to 098 inch (2 235 mm to 2 489 mm) above top edge of valve
Lower port size 053 to 057 inch (1 35 to 1 45 mm) diameter (For idle adjustment screw)

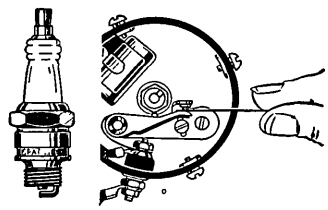
Set Idle Adjustment Screw: ½ to 1½ turns open For richer mixture turn screw out Do not idle engine below 550 to 600 r p m motor speed

Vacuum Spark Port Slot (round end) type size 040 by 110 inch (1 016 by 2 794 mm) Top of port 052 to 058 inch (1 32 to 1 47 mm) above top edge of valve

Main Metering Jet Calibrated to flow 344 to 348 cc per minute Do not gauge for size If in doubt replace with new part

Main Vent Fuel chamber to vent tube well (in air horn) size 063 inch (1 60 mm) diameter In vent tube plug size 0433 (1 10 mm) diameter

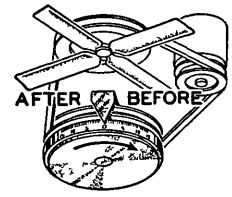
Main Tube Side Holes 1—0354 (90 mm) diameter 3/32 inch (2 381 mm) from end
1—0354 (90 mm) diameter ⅛ inch (3 175 mm) from end
1—0236 (60 mm) diameter ½ inch (12 70 mm) from end
1—0236 (60 mm) diameter 17/32 inch (13 49 mm) from end
1—0157 (40 mm) diameter 1 15/32 inch (37 31 mm) from end



Step Up Jet Size 0492 (1 25 mm) diameter

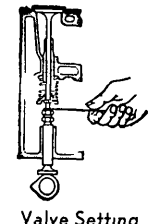
Accelerating Pump Type vacuum operated Stroke non adjustable Pump intake passage ball check seat size 115 to 120 inch (2 93 to 3 05 mm) diameter
Pump discharge passage ball check seat size 062 to 065 inch (1 58 to 1 65 mm) diameter
Pump discharge jet size 0315 inch (80 mm) diameter

Choke Offset butterfly type with poppet valve

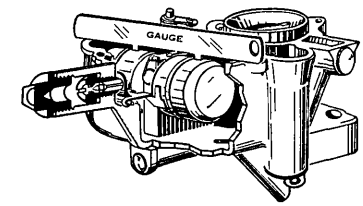


Motor Tune-Up—Be Accurate!

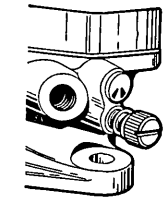
CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap 025"



Breaker Point Setting 018"-020"



Ignition Timing Breaker Points to Open 2° or 003" A T D C

Valve Setting (Hot) Intake 010" Exhaust 012" Set Sodium Valves to 020"

Float Setting (Use Gauge) 5/64 Inch

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level Wear on lip of float lever will raise float level Before adjusting float, be sure float lever pin is firmly seated Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level Bend only vertical lip of float

If motor stalls while idling set throttle lever adjusting screw so motor idle speed is that recommended in motor manufacturers handbook Then set idle adjustment screw to specifications If these adjustments do not correct the trouble remove idle orifice tube and plug assembly Clean tube and passages with compressed air

CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA

PRINTED IN U S A

If engine misses when load is suddenly increased, remove pump jet and clean with compressed air However, it is usually advisable to replace the pump jet, as its cost is nominal All jets must be seated gasoline tight This condition may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a balance tube" in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

EM1 and early production EM2 carbureters were provided with a spacer No 108-40 inserted in the step-up cylinder under the step-up piston This spacer provided these carbureters with an extremely rich part throttle calibration, as the carbureter was originally designed for stationary industrial use However, due to the varying uses of these carbureters, this spacer has now been omitted and normal step-up piston operation will result If a rich part throttle operation is required this spacer may be used

Chrysler 6 & 8—Industrial—1946-47-48—Carbureters Nos. EM1-EM2-EM3-EM4

(E7L4 can also be used)

B-B DOWN-DRAFT CARBURETERS—**MODELS EV1-EV2**

CARBURETER SPECIFICATIONS

For Chrysler Six Cylinder Engine: 3-7/16 Inch Bore, 4½ Inch Stroke

Dimensions: Flange size, 1½ inch (38.1 mm).
Throttle bore, 1-11/16 inch (42.86 mm).
Main venturi, 1-11/32 inch (34.13 mm) I. D.

Float Setting: Top of float 1/16 inch below top surface of carbureter body casting. Plus or minus 1/64 inch.

Vent: Outside none. Inside balance vent .218 inch diameter (5.54 mm).

Gasoline Intake Needle: Triangular, horizontal No. 44 (2.18 mm) drill in needle seat.

Idle Orifice Tube: Jet size .0276 inch (.70 mm) drill. Idle passage air bleed, in body, size .063 inch (1.60 mm) diameter Restriction in body, size .053 inch (1.35 mm) diameter.

Idle Ports: Upper port. Keyhole type: length .128 inch (3.25 mm); width .027 inch (.69 mm). .063 inch (1.60 mm) diameter hole at top. Top of port located .088 to .092 inch (2.24 to 2.34 mm) above top edge of valve (early production); .093 to .097 inch (2.36 to 2.46 mm) above top edge of valve (late production).
Lower port size .053 to .057 inch (1.35 to 1.45 mm) drill. (For idle adjustment screw).

Set Idle Adjustment Screw: ¾ to 1¼ turns open. For richer mixture turn screw out. Do not idle engine below 300 r.p.m. or 6 miles per hour.

Main Metering Screw: Calibrated to flow 312 to 316 cc per minute. (Do not gauge for size. If in doubt replace with new part).

Main Vent: Through diffuser (air bleed inside bowl). Size .0315 inch (.80 mm) drill.

Main Vent Tube: Side Holes, 4—.0354 inch diameter.

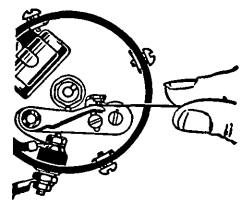
Step-up Jet: Power orifice .0413 inch (1.05 mm) drill.

Accelerating Pump: Type—delayed action.
Stroke—Summer setting (inner hole, short stroke).
Intermediate setting (center hole).
Winter setting (outer hole, long stroke).
Pump intake passage, size .115 to .120 inch (2.93 to 3.05 mm) diameter in body.
Pump discharge passage: Restriction (under ball check) size .062 to .065 inch (1.57 to 1.65 mm) diameter in body.
Pump (discharge) jet size, .0374 inch (.95 mm) drill.

Pump Adjustment: 26/64 inch plunger travel (EV1), 20/64 inch plunger travel (EV2) full throttle position, medium stroke. (Use gauge T109-117S.)

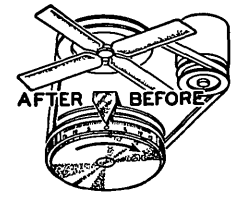
Choke: Offset butterfly type (with poppet valve) interconnected to open throttle valve to fast idle position when choke is used.

Slow Closing Throttle: Dash pot with discharge (By-pass), size .0197 (.5 mm) drill, through valve cage.



Vacuum Spark Port: Slot (round end) type; size .040 by .110 inch (1.016 by 2.794 mm). Top of port .052 to .058 inch (1.32 to 1.47 mm) above top edge of valve.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 300 r. p. m. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube passages with compressed air.

If acceleration is not satisfactory remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. All jets must be seated gasoline tight. Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage. If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather.

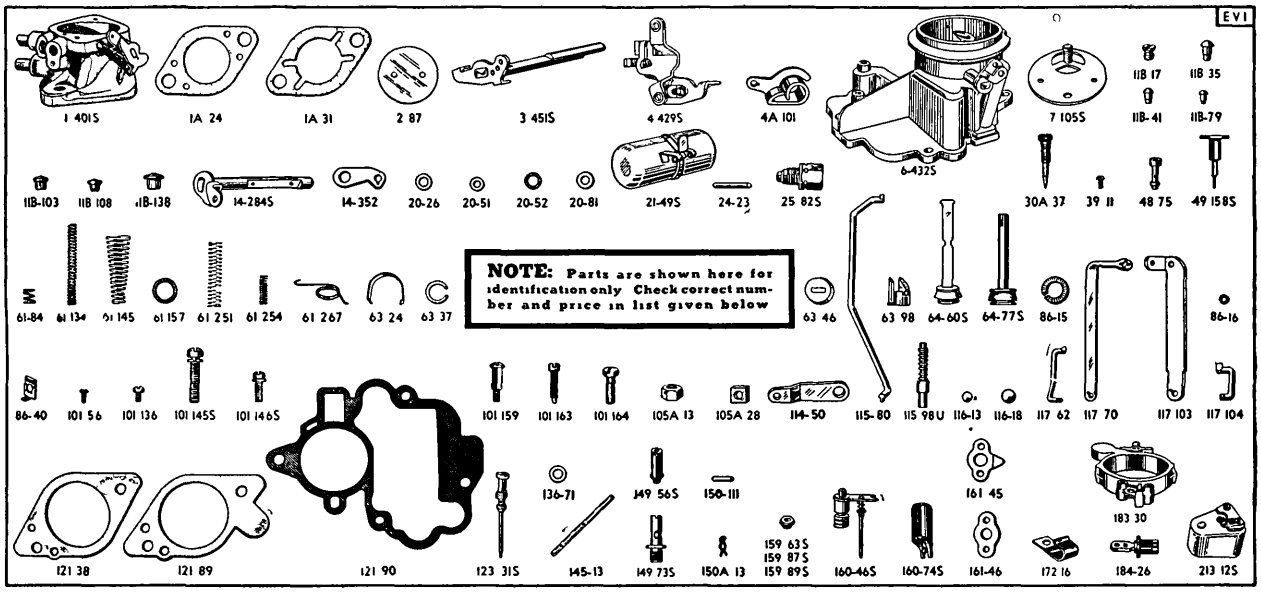
CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA



PRINTED IN U.S.A.

Correct air fuel ratio is provided by a "balance tube' in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43 main vent tube can be removed and a new tube inserted with tool No. T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment: Remove air horn assembly, back out throttle adjustment screw, and place pump operating link in center hole of throttle shaft arm Place gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft Turn knurled nut of gauge until lip contacts plunger shaft at closed and wide open throttle positions. Difference in readings obtained at closed and wide open throttle positions should be "26' (26/64" EV1, using 117-62 link), "20" (20/64" EV2, using 117-60 link) Adjustments can be made by bending horizontal portion of pump lifter link

Pump stroke adjustable for high or low temperature. Set to long stroke for cold weather, short stroke for hot weather driving

Chrysler "C-38"—1946-1948—Nos. EV1-EV2

WHEN SERVICING, USE GASKET ASSORTMENT No. 164A, REPAIR PACKAGE No. 1367C

CARBURETER SPECIFICATIONS

For Six Cylinder Engine 3 7/16 Inch Bore 4½ Inch Stroke

Dimensions Flange size 1½ inch S A E
Throttle bore 1 11/16 inch (42 86 mm)
Main venturi 1 11/32 inch (3 413 mm)

Float Setting Top of float 5/64 inch (1 98 mm) plus or minus 1/64 inch (397 mm) below top surface of carbureter body casting

Vents Outside none Inside balance vent tube 218 inch (5 56 mm) inside diameter

Gasoline Intake Needle Triangular horizontal needle seat hole No 44 (2 18 mm) drill

Idle Orifice Tube Jet size 0276 inch (70 mm)
Idle passage air bleed (in air horn) size 0688 inch (1 75 mm)
Idle restriction in body size 0629 inch (1 60 mm)

Idle Ports Upper port slot type Length 128 inch (3 251 mm) Width 027 inch (686 mm)
Top of port 088 to 098 inch (2 235 mm to 2 489 mm) above top edge of valve (in slot)
Lower port size 053 to 057 inch (1 35 to 1 45 mm) diameter (For idle adjustment screw)

Set Idle Adjustment ¾ to 1¼ turns open For richer mixture turn screw out Do not idle engine below 450 to 500 r p m motor speed

Vacuum Spark Port Slot (round end) type size 040 by 110 inch (1 016 by 2 794 mm) Top of port 052 to 058 inch (1 32 to 1 47 mm)

Main Metering Jet Calibrated to flow 344 to 348 cc per minute Do not gauge for size If in doubt replace with new part

Main Vent Fuel chamber to vent tube wel (in air horn) size 063 inch (1 60 mm) diameter In vent tube plug size 0433 (1 10 mm) diameter

Main Vent Tube Side Holes 1—0354 (90 mm) diameter 3/32 inch (2 381 mm) from end
1—0354 (90 mm) diameter ⅛ inch (3 175 mm) from end
1—0236 (60 mm) diameter ½ inch (12 70 mm) from end
1—0236 (60 mm) diameter 17/32 inch (13 49 mm) from end
1—0157 (40 mm) diameter 1 15/32 inch (37 31 mm) from end

Step Up Jet Size 0492 inch (1 25 mm) diameter

Accelerating Pump Type vacuum operated Stroke non adjustable Pump intake passage ball check seat size 115 to 120 inch (2 93 to 3 05 mm) diameter
Pump discharge passage ball check seat size 062 to 065 inch (1 58 to 1 65 mm) diameter
Pump discharge jet size 0315 inch (80 mm) diameter

Choke Offset butterfly type with poppet valve

MOTOR TUNE-UP

Spark Plug Gap	Set Breaker Points	Ignition Timing Breaker Points to Open	Valve Setting	Float Setting	Idle Setting
025"	020"	T D C	Int — { 010" (Std) / 010" (Sodium) } Exh — { 014" (Std) / 018" (Sodium) }	5/64"	¾ to 1¼ Turns Open

CARBURETER ADJUSTMENTS

Correct float adjustment is important and should be made in the following way

Place float gauge (No T109-50) across the carbureter body Press float lever down to hold float pin against the bottom of the slot in the body casting Floats should just clear the projections on the gauge If adjustment is necessary bend lip on float lever toward intake needle to lower level or away from the needle to raise the float level

If motor stalls while idling set throttle lever adjusting screw so motor runs between 450 and 500 R P M Then set idle adjustment screw ¾ to 1¼ turns open from closed position If a vacuum gauge is available adjust to highest steady gauge reading

Accelerating pump is actuated by the intake manifold vacuum and no adjustment is necessary However, be sure the bowl cover gasket and flange gasket seal to prevent any air leaks to the pump vacuum passages

CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

PRINTED IN U S A

If engine misses when load is suddenly increased, remove pump jet and clean with compressed air However, it is usually advisable to replace the pump jet, as its cost is nominal (All jets must be seated gasoline tight) This condition may also be due to damaged or worn plunger leather in accelerating pump cylinder or discharge check in discharge passage If plunger is removed from cylinder, use care when installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a "balance tube" in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

A fuel filter is incorporated in the carbureter bowl casting It should be cleaned periodically by removing the filter bowl and element (small discs) Soak element in acetone or a mixture of half and half Ethyl Alcohol and Benzol until all foreign material dissolves Then allow to dry CAUTION—do not blow off with compressed air which may damage discs

NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown only one is used

CHRYSLER INDUSTRIAL 6 & 8—1946-1947

BB DOWN-DRAFT CARBURETERS WITH GOVERNOR—**EP1-EP2-EP3-EP5-EP6**

ENGINE MODELS: 7-44, 7-87, 8-104, 8-138, 12-71V, 12-132, 12-151, 12-197, 6-3

Optional Equipment on: 5-250 to 5-255, incl., 7-260 to 7-266, incl., 12-270 to 12-275
(E7E3 can also be used)

Note: Engine Serial Nos. 7-44 (13088), 12-71V (13555), 12-132 (13802), 12-151 (13328), 6-3 (9203)
All Others, 1001 and higher

CARBURETER SPECIFICATIONS

Six Cylinder Engine: 3-7/16 Inch Bore, 4½ Inch Stroke
Eight Cylinder Engine: 3¼ Inch Bore, 4⅞ Inch Stroke

Dimensions: Flange size, 1½ inch S. A. E.
Throttle bore, 1-11/16 inch (42.86 mm).
Main venturi, 1-11/32 inch (3.413 mm).

Float Setting: Top of float 5/64 inch (1.98 mm) plus or minus 1/64 inch (.397 mm) below top surface of carbureter body casting.

Vents: Outside: none. Inside: balance vent tube .218 inch (5 56 mm) inside diameter.

Gasoline Intake Needle: Triangular, horizontal, needle seat hole No 44 (2.18 mm) drill.

Idle Orifice Tube: Jet size, .0276 inch (.70 mm).
Idle passage air bleed (in air horn), size .0688 inch (1.75 mm).
(EP1-EP2-EP3) Idle restriction in body, size .059 inch (1.50 mm).
(EP5-6) Size .0629 inch (1.60 mm).

Idle Ports: Upper port: slot type. Length, .128 inch (3.251 mm). Width, .027 inch (.686 mm).
Top of port .088 to .098 (2.235 mm to 2.489 mm) above top edge of valve (in slot).
Lower port size. .053 to .057 inch (1.35 to 1.45 mm) diameter (For idle adjustment screw).

Set Idle Adjustment: (EP1-2-3) ⅝ to 1⅛ turns open, (EP5-6) ¾ to 1¼ turns open. For richer mixture turn screw out. Do not idle engine below 450 to 500 r.p.m. motor speed.

Vacuum Spark Port: Slot (round end) type: size .040 by .110 inch (1.016 by 2.794 mm). Top of port .052 to .058 inch (1.32 to 1.47 mm) above top edge of valve

Main Metering Jet: (EP1) Calibrated to flow 328 to 332 cc per minute.
(EP2-EP3-EP5-EP6) Calibrated to flow 344 to 348 cc per minute. Do not gauge for size. If in doubt, replace with new part.

Main Vent: Fuel chamber to vent tube well (in air horn), size 063 inch (1 60 mm) diameter. In vent tube plug, size .0433 (1.10 mm) diameter.

Main Vent Tube: Side holes: 1—0354 (.90 mm) diameter, 3/32 inch (2.381 mm) from end.
1—0354 (.90 mm) diameter, ⅛ inch (3.175 mm) from end
1—0236 (.60 mm) diameter, ½ inch (12.70 mm) from end.
1—0236 (.60 mm) diameter, 17/32 inch (13.49 mm) from end.
1—0157 (.40 mm) diameter, 1-15/32 inch (37.31 mm) from end.

Step-Up Jet: (EP1) Size, .0433 (1.10 mm) diameter
(EP2-EP3-EP5-EP6) Size, .0492 (1.25 mm) diameter.

Accelerating Pump: Type, vacuum operated. Stroke, non-adjustable. Pump intake passage ball check seat, size .115 to .120 inch (2.93 to 3.05 mm) diameter.
Pump discharge passage, ball check seat size, .062 to 065 inch (1.58 to 1.65 mm) diameter.
Pump discharge jet, size .0315 inch (.80 mm) diameter.

Choke: Offset butterfly type with poppet valve.

	8 cyl.—.018"	8 cyl.—2° A.T.D.C.	Exhaust { .012" (Std.) .020" (Sodium) }		(EP5-6) ¾ to 1¼ Turns Open

CARBURETER ADJUSTMENTS

Correct float adjustment is important and should be made in the following way.

Place float gauge (No. T109-50) across the carbureter body. Press float lever down to hold float pin against the bottom of the slot in the body casting. Floats should just clear the projections on the gauge. If adjustment is necessary, bend lip on float lever toward intake needle to lower level or away from the needle to raise the float level.

If motor stalls while idling, set throttle lever adjusting screw so motor runs between 450 and 500 R P.M. Then set idle adjustment screw (EP1-2-3) ⅝ to 1⅛, (EP5-6) ¾ to 1¼ turns open from closed position If a vacuum gauge is available, adjust to highest steady gauge reading.

Accelerating pump is actuated by the intake manifold vacuum and no adjustment is necessary However, be sure the bowl cover gasket and flange gasket seal to prevent any air leaks to the pump vacuum passages

If engine misses when load is suddenly increased, remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. (All jets must be seated gasoline tight.) This condition may also be due to damaged or worn plunger leather in accelerating pump cylinder or discharge check in discharge passage If plunger is removed from cylinder, use care when installing to avoid damage to plunger leather.

Correct air fuel ratio is provided by a "balance tube" in the air horn. The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner. Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed.

A fuel filter is incorporated in the carbureter bowl casting It should be cleaned periodically by removing the filter bowl and element (small discs). Soak element in acetone or a mixture of half and half Ethyl Alcohol and Benzol until all foreign material dissolves. Then allow to dry. CAUTION—do not blow off with compressed air which may damage discs

163 37	Carter Seal	
163 49	★Adjusting nut seal	
170-107S	Throttle shaft housing assembly (EP1 2 3)	
170-143S	Throttle shaft housing assembly (EP5 6)	

★Governor parts are of the latest design and must be set to 220 13 specifications (Form 4719D) when used to rebuild 220 5 and 220 7 After rebuilding and calibration is complete stamp 220 13 on cover plate assembly

†30 55S may be used if 11B 214S is used

NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown only one is used

Form 4719D

CARTER CARBURETOR
DIVISION OF acf INDUSTRIES INCORPORATED
ST. LOUIS, MO., U. S. A.

July, 1947
Revised May, 1952

THE CARTER VELOCITY GOVERNOR

Used in conjunction with EP1, EP2, EP3, EP5, EP6 carbureters. Optional on Chrysler Industrial engines, models Ind. 5, 6, 7, 8, 12, 13, 14

Governor Speed range on 6 cylinder engines Ind. 5, 6, 7, 8: 1200-2800 R.P.M.
Governor Speed range on 8 cylinder engines Ind. 12: 1200-2000 R.P.M.
Governor Speed range on 6 cylinder engines Ind. 13: 1200-2400 R.P.M.
Governor Speed range on 6 cylinder engines Ind. 14: 1200-1800 R.P.M.

Used in conjunction with EYA1-E7E1-E7E2-E7E3 carbureters. Optional on Chrysler Industrial engine model Ind. 8; speed range 2500-3200 R.P.M.

GOVERNOR ASSEMBLY

1. Cover Plate Lead Seal Plugs
2. Secondary Adjusting Screw Plug
3. Speed Adjusting Screw Plug
4. Lead Car Seals
5. Idle Mixture Adjusting Screw
6. Governor Unit Number
7. Throttle Shaft Housing Assembly
8. Throttle Stop Screw
9. Idle Speed Adjusting Screw

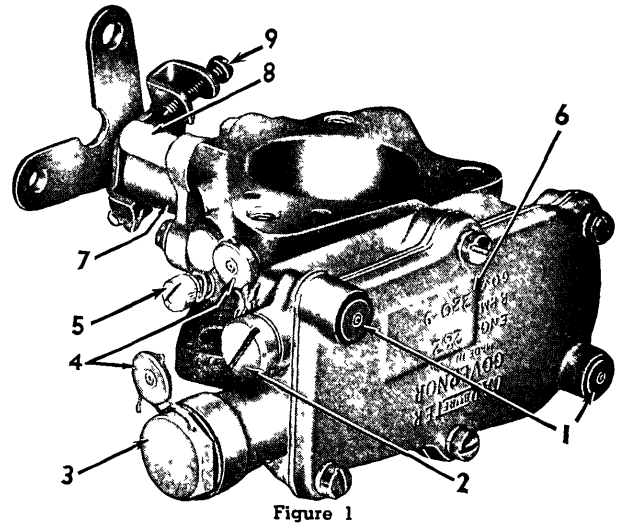

Figure 1

The action of the throttle valve is the same as that in conventional carbureters up to the governed sp d of the engine. The governor therefore, does not affect idle or economy nor does it affect power or acceleration under the speed at which engine is governed.

GOVERNOR ADJUSTMENTS

The governor is properly calibrated when it leaves the factory and should not require any attention, aside from a speed adjustment to satisfy operation requirement.

Before any governor adjustment is attempted engine must be tuned to manufacturer's specifications.

Run engine until normal operating temperature is reached. The manifold vacuum at sea level must be at least 16 inches with engine operating at no load, transmission in neutral (wide open throttle with governor controlling engine speed) and at least 17 inches at idling speed (450-500 R. P. M.) with an allowable reduction for approximately 3½ inches at 5,000 feet above sea level.

To adjust governed engine speed, remove large screw cap and gasket and with a screw driver, turn the primary adjusting screw (Figure 2) clockwise to decrease engine speed, and counter-clockwise to increase engine speed.

CAUTION: Do not turn adjusting screw out beyond the end of the governor housing to the extent that it will interfere with the complete tightening of the screw cap. Primary spring can become disengaged from the adjusting screw if screw is turned too far out (do not force).

It is desirable to check and set the governed engine speed with the aid of a reliable electric or mechanical tachometer.

E7E3	220-29	2-15/64"	15-1/4	3/8"

'A' Dimension—Measurement from front of retainer to end of secondary spring.

"B" Specifications—Number of active spring coils from end of adjusting screw thread to end of spring

'C" Dimension—Measurement from housing boss to end of adjusting screw

GOVERNOR SERVICE INSTRUCTIONS

If governor has been tampered with, or should the adjusting screw be turned out of the primary spring due to faulty adjustment recalibration will be necessary to insure proper operation This will require removal of the carbureter from the engine If recalibration is necessary, proceed as follows

1 Determine the governor unit number (stamped on the cover plate and also on housing on later production) and refer to the chart in conjunction with Figure 2 for calibration specifications

2 Remove lead seal plugs from the two depressed screw openings in the governor cover plate by prying out with a small screw driver Remove all retaining screws and cover Never attempt to remove governing lever assembly from end of throttle valve shaft

3 Remove shaft housing and lever assembly located at end of throttle shaft opposite governor assembly Before removal be sure to note and mark position of long throttle stop screw for correct reassembly Never immerse this part in cleaning solvent as this may cause swelling of throttle lever shaft assembly seal

4 Carbon or gum deposits in the throttle shaft bearing races may eventually cause friction and result in sluggish and inaccurate governor performance Therefore, it is advisable before proceeding with recalibration of governor, to squirt some non corrosive solvent in the narrow space between the throttle shaft and shaft openings in the throttle bore and clean with compressed air Do not use any solvent which might leave a gummy film Never apply lubricating oil to throttle shaft bearings

5 Check fit of throttle valve in throttle bore as follows

Hold governor valve open and with long nose pliers disconnect loop of primary spring from the governing lever link This will allow the throttle valve to close with very little pressure from the secondary spring and makes checking of the throttle valve fit much easier The throttle valve must not touch the bore of the carbureter flange when in any position except when completely closed Check the centering of the valve by holding the flange up to a light, closing the valve tightly and looking through the bore The valve should touch the bore at the idle port and also the point opposite to it The sides of the valve near the throttle shaft should not touch the bore and approximately the same clearance should be visible on both sides If throttle valve is not propery aligned, loosen the two attaching screws, then with the valve in closed position rotate and shift valve with the fingers to obtain proper alignment Tighten the two screws Connect primary spring to governing lever link Do not tap throttle valve or throttle shaft when refitting valve

6 Remove secondary adjusting screw plug and gasket assembly and check A' dimension of secondary adjusting screw and spring assembly Open throttle to make sure that the secondary spring is not in contact with governing lever Turn secondary screw clockwise to decrease dimension, and counter-clockwise to increase dimension Secondary spring assembly may be removed for replacement by removing retainer while pressing lightly on head of secondary adjusting screw, then backing out screw

Upon reassembling, be sure that retainer is installed in proper slot and not against thread (see Figure 2) and that secondary spring compresses without buckling as throttle valve is closed If spring buckles remove secondary spring assembly and revolve entire spring assembly 1/6 turn and reinstall If necessary, repeat until buckling condition no longer exists Never remove secondary spring from its holder since this will damage spring

7. Check "C' dimension (throttle valve closed) This controls the primary spring tension (First make sure that the adjusting nut is pressed all the way into casting by tapping with tool T109 185)

Correct "C" dimension if necessary by turning the primary adjusting screw, clockwise to increase dimension, counter clockwise to decrease dimension

8 Check "B" specification. This is the number of active coils. In order that the number of active coils may easily be counted, hold the throttle valve closed to separate the coils In counting the number of active coils start at the first complete coil from the loop end as shown in Figure 3 The active coils end at the entering edge of the primary adjustment screw thread as shown in Figure 4

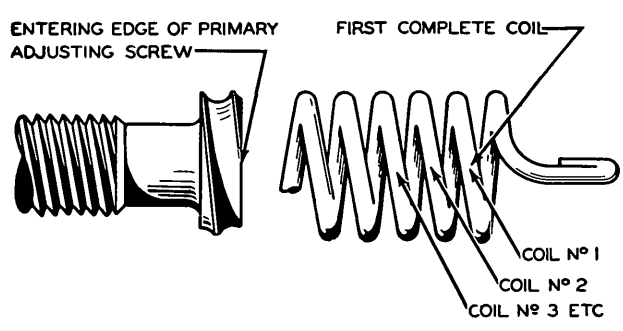

FIGURE 4 FIGURE 3

If the number of active coils is within one coil of "B specification it may be considered satisfactory

If the number of active coils is not within one coil of "B' specification, indications are that the spring has been tampered with and recalibration with the adjusting nut is necessary To do this proceed as follows

Set the amount of active coils (B ' specification) with the adjusting screw

Where a fractional number of coils is required, first adjust to the nearest whole number of coils as described above Then add or subtract the fractional coil by turning the primary adjusting screw the same fraction of a turn As an example— if 14 3/4 coils are called for in ' B ' specification, adjust to obtain exactly 15 active coils Then turn primary adjusting screw 1/4 turn or 90° clockwise, thereby reducing the number of active coils to 14 3/4

Should the end coil of the primary spring contact the governor housing or if the primary adjusting screw is turned in so far that the slotted end becomes flush with the adjusting nut assembly before the correct amount of coils is obtained, it will be necessary to adjust the nut Hold the primary adjusting screw with screw driver so that it cannot turn, while turning the adjusting nut with tool T109 185

9 Once the correct number of active coils has been established with the adjusting screw, set "C" dimension

To do this hold the primary adjusting screw with screw driver so that it cannot turn while turning the adjusting nut with tool T109 185 Turn clockwise to decrease C ' dimension, counter clockwise to increase the dimension When dimension is correct, tap end of wrench with a light hammer to seat adjusting nut as adjusting nut must be firmly seated, then recheck dimension

10 To replace damaged primary adjusting screw or nut Hold throttle valve open, unhook the primary spring from the link and using a narrow screw driver, turn the primary adjusting screw clockwise until it is out of adjusting nut Place fiber drift inside governor housing, against adjusting nut and drive out nut To reassemble primary adjusting screw and adjusting nut assembly proceed as follows

Install primary adjusting nut, driving nut against seat in housing with tool T109 185 (always use new part to make certain of tight fit) Start primary adjusting screw in adjusting nut from inside of housing then turn screw counter clockwise with narrow screw driver until all but a few threads have engaged the nut Screw will be a tight fit as it will be cutting new threads in adjusting nut fiber insert

Insert tail of primary spring in slot in governor housing, bring against entering edge of adjusting screw and turn screw clockwise until a few coils have been engaged Hook spring to governing lever link

11 Inspect throttle shaft pick up dog for wear If replacing dog, install in proper relation to throttle valve as shown in Figure 5 If dog is tight, do not hammer or tap in place Draw into place with screw and lock washer

CAUTION Excessive tightening may shear screw

Before installing same or new shaft housing and lever assembly be sure that throttle lever assembly is snug against the shoulder of the flat on the shaft (stub)

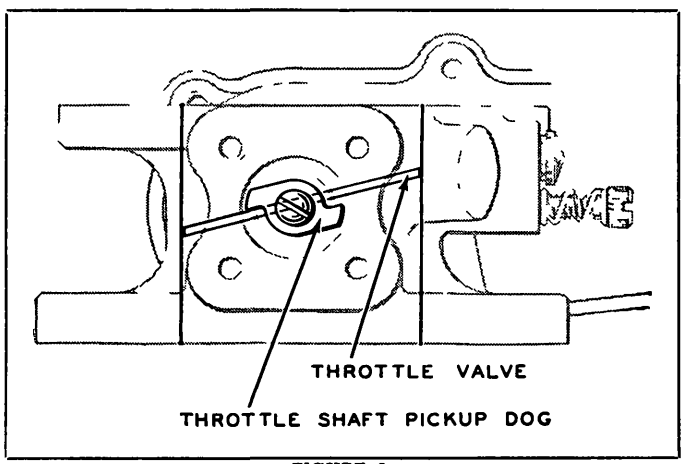

FIGURE 5

Holding throttle valve closed, and throttle lever assembly in open position, install shaft housing and lever assembly and gasket with throttle stop screw in previously marked position

12 Install governor housing cover and gasket

While supporting governor housing over edge of bench place lead shot (part 103 11) in the two depressed screw openings Tamp into place and stamp with identifying tool Install adjusting screw plug assemblies

13 Install carbureter and governor assembly on engine Warm up engine Hook up tachometer and check governed no load speed Set with primary adjusting screw to required R P M

If the engine surges under heavy load with the governor controlling engine speed, turn the speed adjusting screw clockwise, 1/2 turn at a time, and correct maximum governed speed by turning the adjusting nut clockwise Repeat if necessary until the surge is eliminated

Should engine surge (continued rapid rise and fall of engine speed) at governed engine speed (no load) transmission in neutral turn secondary adjusting screw counter-clockwise 1/2 turn at a time until surge is just eliminated If this adjustment increases the maximum governed engine speed, reduce same by turning the primary adjusting screw clockwise until maximum governed engine speed is re-established

14 When final adjustments are completed, install adjusting screw plug assemblies Seal by threading wire through plug and hole in boss in governor housing and crimp lead seal with identifying tool Both adjustments must be sealed with wire and lead seal

RECONDITIONING BEYOND THAT COVERED BY THESE INSTRUCTIONS IS NOT RECOMMENDED AND MAY REQUIRE REPLACEMENT OF THE COMPLETE GOVERNOR AND FLANGE ASSEMBLY.

BB UP-DRAFT CARBURETERS **Nos. 6J2-6J3-6K2-6K3**

CARBURETER SPECIFICATIONS

For Six-Cylinder Engine, Model M7—3-7/16 Inch Bore, 4½ Inch Stroke
For Eight-Cylinder Engine, Model M8—3¼ Inch Bore, 4⅞ Inch Stroke

Dimensions: Flange size, 1½ inch (38.10 mm).
Throttle bore, 1½ inch (38.10 mm).
Main venturi, 1-1/16 inch I. D. (26.99 mm).
Air bleed through venturi, to idle passage .076 inch diameter (1.93 mm) drill.

Float Setting: Top of float 1/32 to 1/16 inch (.79 to 1.59 mm) below top of surface of lower body.

Balance Vent Tube: Inside diameter, 7/32 inch (5.56 mm).

Gasoline Intake Needle: Triangular, horizontal. No. 44 (2.18 mm) drill in needle seat.

Idle Jet Tube: Jet size, .0236 inch (.60 mm) drill.

Idle Ports: Lower port size: .062 to .064 inch (1.58 to 1.63 mm) diameter. Top of port located .005 to .009 inch (.13 to .23 mm) below lower edge of valve. Upper port size: .053 to .057 inch (1.35 to 1.45 mm) diameter (for idle adjustment screw).

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. Do not idle engine below 300 r.p.m. or 6 m.p.h.

Main Metering Screw: (6J2-6K2) Adjustable.

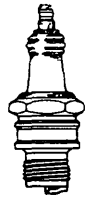
Main Metering Jet: (6J3-6K3) Calibrated to flow 350 cc per minute. (Do not gauge for size. If in doubt, repair with new part.)

Nozzle: (6J2-6K2) No. 33 (2.87 mm) drill, I. D. (30°).
(6J3-6K3) No. 31 (3.04 mm) drill, I. D. (30°).

Accelerating Jets: 2—.038 inch (.97 mm) drill 1/16 inch (1.59 mm) from shoulder.
2—.038 inch (.97 mm) drill ⅜ inch (9.525 mm) from shoulder.
2—.038 inch (.97 mm) drill 23/32 inch (18.256 mm) from shoulder.
2—.063 inch (1.60 mm) drill 1-1/16 inch (26.99 mm) from shoulder.

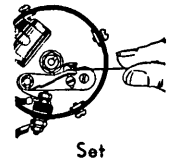
Air Bleed to Nozzle: (Vent tube) Size, .048 inch (1.22 mm) drill.

Step-Up Jet: (Power Orifice) Size, .055 inch (1.4 mm) drill (early production). Size, .0472 inch (1.2 mm) drill (late production).



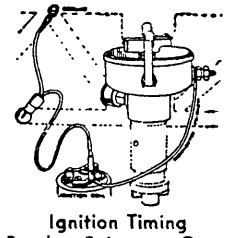
Accelerating Pump: Type, low pressure, delayed action. Stroke: Summer setting, inner hole, short stroke 9/16 inch (14.29 mm). Winter setting (outer hole, long stroke) 1 inch (25.40 mm). Pump intake ball check: Size ⅛ inch (3.175 mm). Pump discharge retainer (in pump valve cage assembly) .0635 inch diameter (1.615 mm) drill size.

Choke: Butterfly type, with poppet valve.

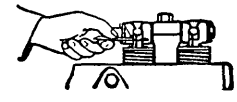


Vacuum Spark Port: .029 inch (.73 mm) diameter.

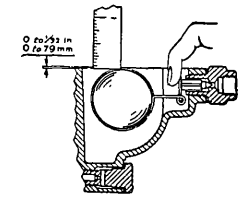
Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .025"



Set Breaker Points (6J2-6J3—M8) .018" (All—M7) .020"

Ignition Timing Breaker Points to Open (6J2-6J3—M7-M8) 2° ATDC (6K2-6K3—M7) 4° ATDC (Cast Iron Pistons)

Set Valves Hot (6J2-6J3—M7-M8) Intake .008" Exhaust .010" (6K2-6K3—M7) Intake .010" Exhaust .010"

Correct Float Level 1/32" to 1/16" Below Edge of Casting (Remove Gasket)

CARBURETER ADJUSTMENTS

To Secure a Good Idle: Set throttle lever adjusting screw so motor runs approximately 300 rpm. Then set idle adjustment screw so motor fires evenly. Correct setting will be found between ½ and 1½ turns open. A richer mixture is obtained by backing out adjustment screw—a leaner mixture by turning screw in. If motor stalls while idling, remove idle passage tube and idle jet tube and clean with compressed air.

Pump Stroke is adjustable. Pump link connected by inner hole produces short stroke, outer hole results in long stroke. Use setting consistent with good performance.

If Motor Loads—Check Float Level: Wear on lip of float lever will raise float level from factory setting, causing carbureter to load up. To lower float level, bend lip of float lever toward needle. To raise float level, bend lip away from needle. A very slight bend is sufficient. Be sure to bend lip of float, not bracket.

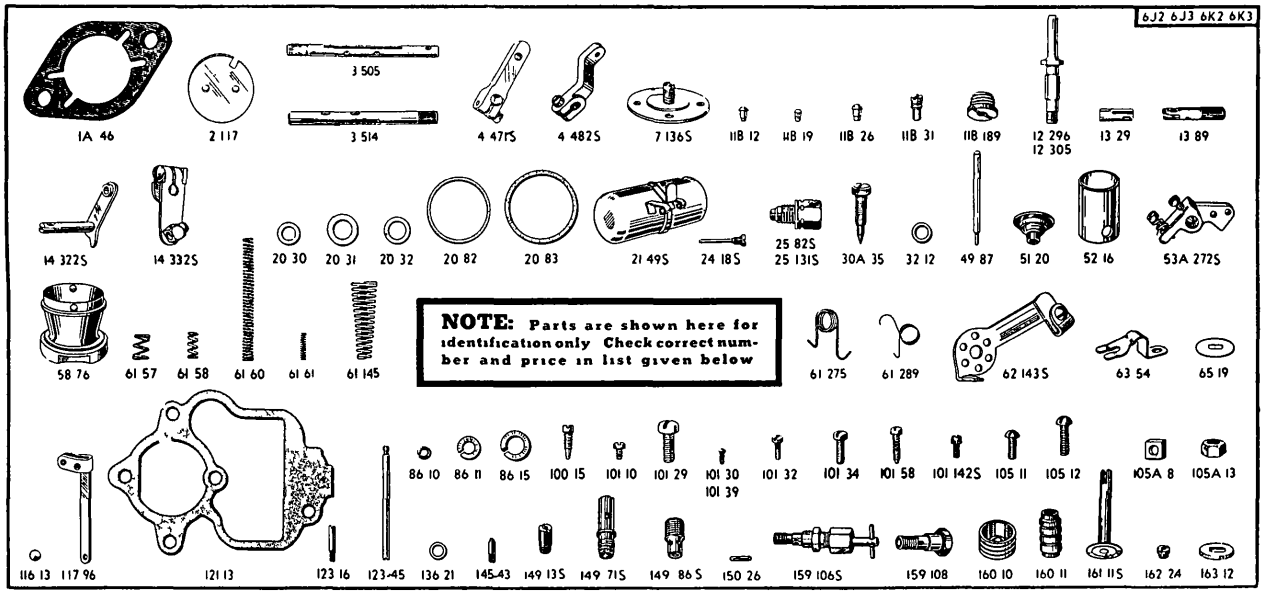
Economy



(a) Maximum economy is secured only when breaker points, spark plugs, valves and ignition timing are set to manufacturer's specifications

(b) Float level must set as instructed

(c) Ball must be free in checks and seats should be clean When reassembling all checks must be screwed in tight against seat

(d) Step-up push rod must move freely in upper and lower guides and be installed with small end down

(e) Step-up piston in upper casting should not bind and must be free from dirt and carbon accumulation

CHRYSLER "8" INDUSTRIAL 1943

WDO DUAL DOWN-DRAFT **CARBURETER 373S**

CARBURETER SPECIFICATIONS

For Chrysler 8 Cylinder Engine: 3¼ Inch Bore, 4⅛ Inch Stroke

Dimensions: Flange size, 1¼ inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 21/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: Distance from float to bowl cover to be 9/64 inch when needle is seated. (Use gauge No. T109-34.)

Outside Vent: No. 20 drill. Inside, none.

Gasoline Intake: Square vertical needle. Size No. 38 drill hole in needle seat.

Low Speed Jet Tube: Jet size, No. 71 drill.
By-pass in body, size No. 53 drill.
Restriction in body, size No. 50 drill.
Idle bleed, size No. 52 drill.

Idle Port: Length, .175 inch; width, .030 inch.

Idle Port Opening: .009 to .015 inch with valve closed tight.

Idle Screw Seat: No. 52 drill.

Set Idle Adjustment Screw: ½ to 1 turn open. For richer mixture, turn screw out. Do not attempt to idle engine below 350 r. p. m.

Main Nozzle: In primary venturi, angle 45°. Discharge jet size No. 30 drill.

Nozzle Retainer Plug: Jet size, .067 inch diameter.

Metering Rod: Economy step, .073 inch diameter, middle step tapers from .070 to .065 inch diameter; power step, .039 inch diameter. Length of rod 2-59/64 inches.

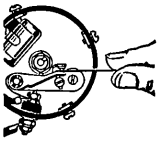
Metering Rod Jet: No. 41 drill, .096 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-27 (2.359 inches).

Accelerating Pump: Low pressure type, with adjustable stroke.
Discharge jet (external bleed type), size, No. 70 drill.
Intake ball check, size No. 62 drill.
Discharge ball check, size No. 45 drill.
Relief passage to outside, .0935 inch diameter.

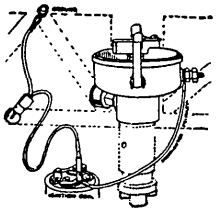
Pump Adjustment: 16/64 inch plunger travel (full throttle position). Use gauge T109-117S.

Choke: Butterfly type, with poppet valve.

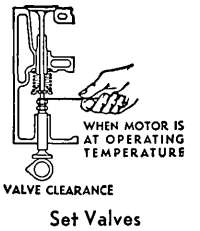


Vacuum Spark Port: .039 to .041 inch diameter.
Top of port .029 to .033 inch above valve.

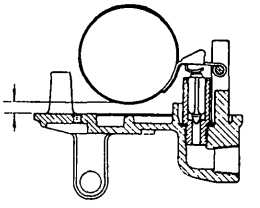
Motor Tune-Up—Be Accurate!



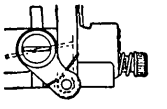
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .025"



Set Breaker Points .020"



Use Timing Light Breaker Points to Open T. D. C.

Set Valves Intake .008" Exhaust .010"

Correct Float Level (Remove Cork Gasket) 9/64-Inch

Idle Adjustment Screw Setting ½ to 1 Turn Open

CARBURETER ADJUSTMENTS

PUMP ADJUSTMENTS: With pump connector link in outer hole (long stroke), throttle lever set screw backed out, pump plunger should travel 16/64" from closed to wide open throttle position. Use gauge No. T109-117S. Adjustment can be made by bending throttle connector rod at lower angle.

METERING ROD ADJUSTMENT should be made when reassembling carbureter or when leaner than standard rods are installed. (Do not disturb pump adjustment.) Correct setting of metering rods is important. Procedure is as follows:

A. Remove air horn, back out throttle lever adjusting screw and loosen anti-percolator arm screw one full turn.

B. Remove metering rod pin, rods, metering rod disk retainer and disks.

C. Insert two T109-27 metering rod gauges in place of metering rods, seating tapered ends in metering rod jets. Install metering rod pin. With metering rod pin resting on shoulders of both gauges (allowing .005" variation at either gauge) tighten anti-percolator arm screw.

D. Remove gauges and replace metering rod disks, retainer and screw. Install metering rods, spring and pin and connect metering rod spring. Lubricate pump arm shaft (with graphite grease) through holes in top of boss in bowl cover.

ANTI PERCOLATOR ADJUSTMENT· Back out throttle lever adjusting screw With throttle valves seated, bend lips on anti-percolator arm until indicator lines on both valve stems are flush with top of both anti-percolator plugs **An even adjustment must be made on both stems.**

UNLOADER ADJUSTMENT With throttle wide open, distance between upper edge of choke valve and wall of air horn should be 1/4 inch (Tool T109-31) Adjust by bending lip on fast idle connector link With throttle wide open move choke valve wide open and choke valve will be locked in wide open position if unloader is adjusted properly Closing the throttle will release choke valve Choke trip lever is notched out for this setting

FAST IDLE ADJUSTMENT· Hold choke valve tightly closed and adjust fast idle arm screw to give 018 inch opening between edge of throttle valve and bore of carbureter (side opposite port)

For Continental F6209 Engine 3 3/16 Inch Bore 4 3/8 Inch Stroke

Dimensions Flange size 1 1/4 S A E
Primary venturi 11/32 inch I D
Main venturi 1 000 inch I D

Float Setting Distance from float (at free end) to float chamber cover to be 3/8 inch with free weight of float on needle and spring

Vents Outside No 10 drill size

Gasoline Intake Square vertical needle No 53 drill size in needle seat

Low Speed Jet Tube Jet size No 71 drill Idle well jet No 61 drill
By pass in body 059 to 060 inch diameter
Economizer in body 0515 to 0525 inch diameter
Idle bleed size No 52 drill

Idle Port Length 140 inch Width 030 inch

Idle Port Opening 010 to 014 inch below lower edge of valve with valve closed tight

Idle Screw Seat No 46 drill

Set Idle Adjustment Screw 3/8 to 7/8 turns open For richer mixture turn screw out

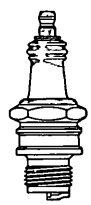
Main Nozzle (Flush type) in primary venturi angle 30° Discharge jet size 096 inch diameter

Nozzle Retainer Plug Jet size 1015 inch diameter

Metering Rod Economy step 0615 inch diameter second step tapers to 051 inch diameter Power step 051 inch diameter Length 3 25/64 inches

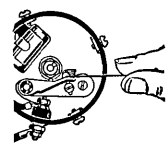
Metering Rod Jet Size 070 inch diameter

Metering Rod Setting Use gauge part No T109 26 (2 718 inches)



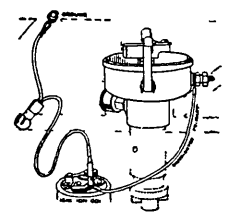
Accelerating Pump High pressure type spring operated lever
Discharge jet size No 72 drill
Relief passage to outside size No 42 drill
Intake ball check size No 40 drill
Discharge disk check size No 40 drill

Pump Adjustment 20/64 inch plunger travel at full throttle position Use gauge T109 117S

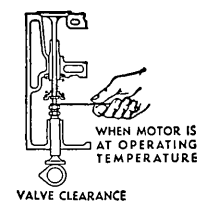


Choke Manual—butterfly type with pressure relief poppet valve

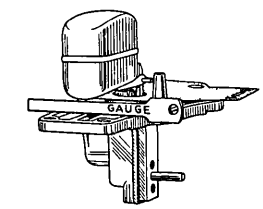
Motor Tune-Up—Be Accurate!



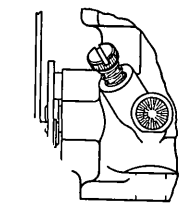
CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap 025"



Set Breaker Points 018"



Use Timing Light Breaker Points to Open at T D C

Set Valves (Cold) Intake 014" Exhaust 014"

Correct Float Level (Measure from machined surface of casting) 3/8"

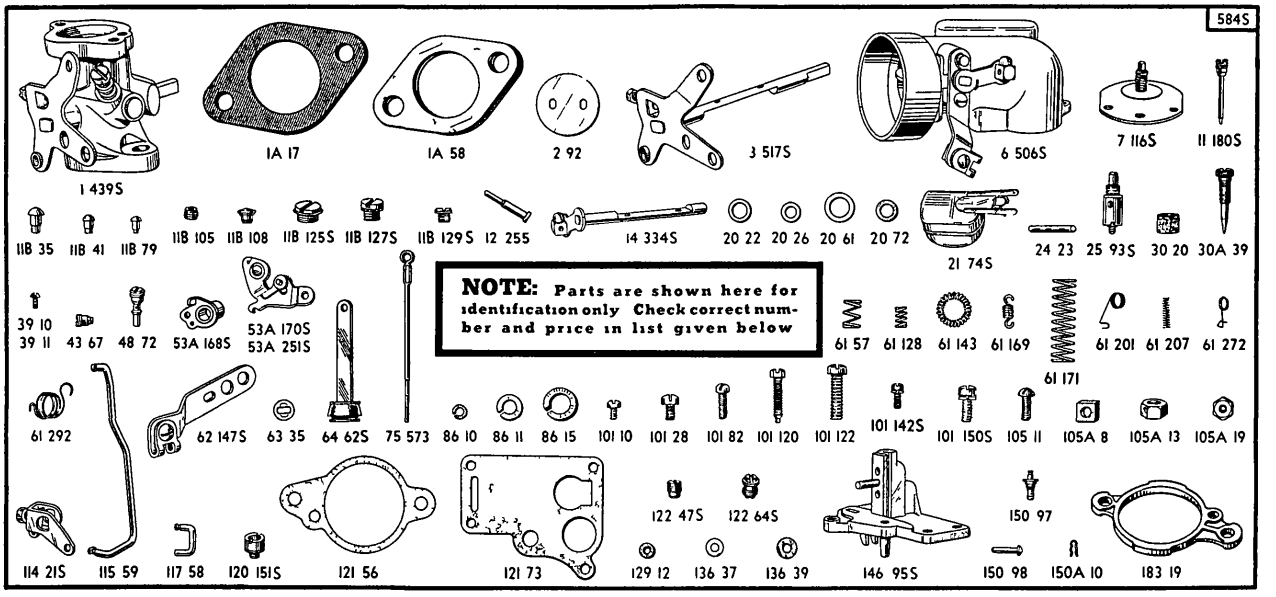
Idle Adjustment Screw Setting 3/8 to 7/8 Turns Open

CARBURETER ADJUSTMENTS

Float Adjustment If carburetor loads up check float level Reset to specifications by bending needle contact lip on float

Idle Adjustment If motor stalls while idling reset throttle lever set screw and idle adjustment screw to specifications If trouble is not corrected remove low speed jet first, then idle well jet and clean jets and passages with compressed air Replace with new jets of identical specifications when necessary to seat gasoline-tight

Pump Adjustment With throttle valve seated and throttle lever set screw backed out pump plunger should travel 20/64" from closed to wide open throttle position Adjustment is made by bending throttle connector rod at lower angle using tool T109-41 Pump travel can be measured by using gauge T109-117S Difference between numbers on gauge at wide open and closed throttle position should be 20



Metering Rod Adjustment Metering rod setting must be made after pump adjustment Install metering rod pin and spring assembly washer and nut loosely on pump operating lever Insert gauge (Tool T109-26) in place of metering rod seating tapered end in metering rod jet With gauge held vertical and throttle valve seated push metering rod pin down to rest on shoulder of gauge notch and tighten nut Remove gauge and install metering rod disc and pin spring Connect metering rod spring through hole in metering rod Bend lower end of spring when necessary to exert slight downward pressure of metering rod on metering rod pin when off of jet

CROSLEY
MOTOR GENERATOR

WO DOWN-DRAFT CARBURETER **No. 934S**

CARBURETER SPECIFICATIONS

For Crosley 4 Cylinder Engine: 2½ Inch Bore, 2¼ Inch Stroke

Dimensions: Flange size, 1 inch S. A. E.
Primary venturi, 11/32 inch I D
Main venturi, ¾ inch I. D.

Float Setting: See adjustments.

Vents: Inside: No. 10 (.1935 inch) drill, in air horn.
Outside: None. Idle well to bore, No. 65 (.035 inch) drill.

Gasoline Intake: Spring loaded needle. No. 53 (.0595 inch) drill size in needle seat.

Low Speed Jet Tube: Jet size, No. 70 (.028 inch) drill.
Idle well jet, size No. 65 (.035 inch) drill.
By-pass in body, size .070 inch diameter.
Economizer in body, size 070 inch diameter
Idle bleed, size No. 47 (.0785 inch) drill.
Idle well to bowl fuel chamber, No. 30 (.01285 inch) drill.

Idle Port: Upper port—slot type Length, .086 inch Width .030 inch

Idle Port Opening: 050 to 054 inch above top edge of valve with valve tightly closed

Idle Screw Seat: No. 46 (.081 inch) drill.

Set Idle Adjustment Screw: 1 to 2 turns open. For richer mixture turn screw out. Do not idle engine below 600 RPM.

Main Nozzle: Inside diameter No. 40 (.098 inch) drill.

Nozzle Retainer Plug: Jet size· No. 58 (.042 inch) drill

Metering Rod: Economy step, 048 inch diameter. Power step, 040 inch diameter.

Metering Rod Jet: Size 067 inch diameter

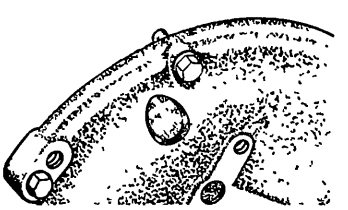
Metering Rod Setting: See adjustments.

Accelerating Pump: Pressure type, spring operated lever
Discharge (pump) jet size, No. 75 (.021 inch) drill.
Intake, ball check, seat size No. 40 (.098 inch) drill.
Discharge, disk check, seat size No. 40 (.098 inch) drill

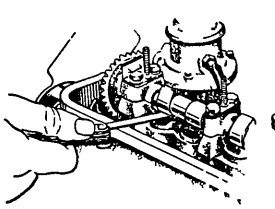
Pump Adjustment: See adjustments.

Choke: Manual—Offset, butterfly type, with pressure relief poppet valve Interconnected to open throttle valve to fast idle position when choke is used

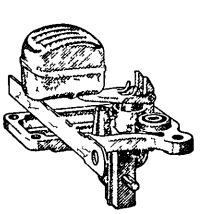
Motor Tune-Up!—Be Accurate! Always Use Feeler Gauges!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .025"



Breaker Point Setting Magneto Ign. .018"

Ignition Timing Breaker Points to Open: 18° B.T.D.C.

Valve Setting (Cold) Intake .004"-.006" Exhaust .007"-.009"

Float Setting ½ Inch (Gauge T109-83)

Idle Adjustment Screw Setting 1 to 2 Turns Open

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: With gasket removed, bowl cover inverted, and free weight of float resting on needle pin, the distance from free end of float to machined surface of bowl cover should be ½" (gauge T109-83).

PUMP ADJUSTMENT: Back out throttle lever set screw. With throttle valve seated, pump link in lower hole (short stroke), pump should travel 10/64" from closed to wide open position. Adjustment can be made by bending throttle connector rod at lower angle with tool T109-213. Pump travel can be measured with universal pump travel gauge T109-117S by placing base of gauge on raised portion of bowl cover so that projecting lip of pump gauge rests on top surface of

TRADE MARK REG U S PAT. OF.
MARCA REGISTRADA

PRINTED IN U.S.A.

pump shaft. Hold gauge vertical The difference between the number shown by index mark on gauge, at wide open and closed positions, should be "10".

METERING ROD ADJUSTMENT: Correct setting of metering rod is important and must be made after pump adjustment Install metering rod pin and spring assembly, washer and nut loosely on pump operating lever Insert gauge (tool T109-26) in place of metering rod, seating tapered end in metering rod jet Hold gauge vertical to insure seating With throttle valve seated, push metering rod pin even with shoulder of notch in gauge and tighten nut (tool T109-76) Remove gauge and install metering rod, disk and pin spring Connect metering rod spring

CROSLEY MARINE ENGINE 1950-1951

UT UP-DRAFT **CARBURETER No. 852S**

CARBURETER SPECIFICATIONS

For Crosley Marine 4 Cylinder Engine: 2½ Inch Bore, 2¼ Inch Stroke

Dimensions: Flange size, 1 inch S. A. E.
Throttle bore, 1-1/16 inch.
Main venturi, 21/32 inch.

Float Setting: With body gasket removed and free weight of float resting on needle, there should be 11/64 inch (plus or minus 1/64 inch) clearance between seam of float (both sides) and machined surface of casting.

Vents: Outside, none. Inside, balance vent No. 12 drill.

Gasoline Intake Needle: Square vertical needle. (Early production) size No. 38 drill in needle seat. (Late production) size No. 55 drill in needle seat.

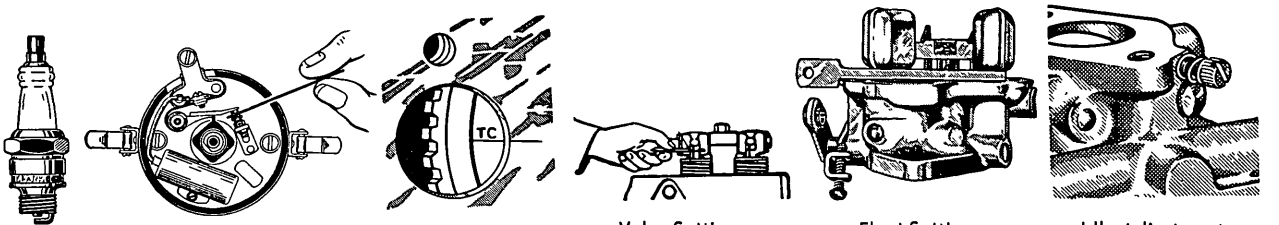
Idle Jet Plug: Jet size, No. 70 (.028 inch) drill.
Upper bleed: No. 65 drill.
Lower bleed: No. 60 drill.
Economizer: No. 61 drill.

Idle Ports: Lower port, slot type, round end, .049 to .051 inch by .029 to .031 inch wide. Bottom of port .044 to .048 inch below lower edge of valve. Upper port .038 to .042 inch diameter (for idle adjustment screw).

Set Idle Adjustment Screw: ½ to 1 turn open. For richer mixture, turn screw out. Do not idle engine below 400 r.p.m.

Main Metering Jet: Adjustable, 1¾ to 2¾ turns open.

Nozzle: In primary venturi, angle 24° from vertical Inside diameter No. 44 drill.
Accelerating jets: 2 No. 64 (.036 inch) drill 21/64 inch from shoulder. 2 No. 64 (.036 inch) drill 27/32 inch from shoulder.



Air Bleed to Nozzle: (Thru plug) No. 65 drill.

Choke: Manual—Butterfly type, with pressure relief (poppet) valve.

Vacuum Spark: None.

Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .025"

Breaker Point Setting .020"

Ignition Timing Breaker Points to Open: 12° B. T. C.

Valve Setting (Cold) Intake .004"-.006" Exhaust .007"-.009"

Float Setting (Use Gauge T109-205) 11/64" ± 1/64"

Idle Adjustment Screw Setting ½ to 1 Turn Open

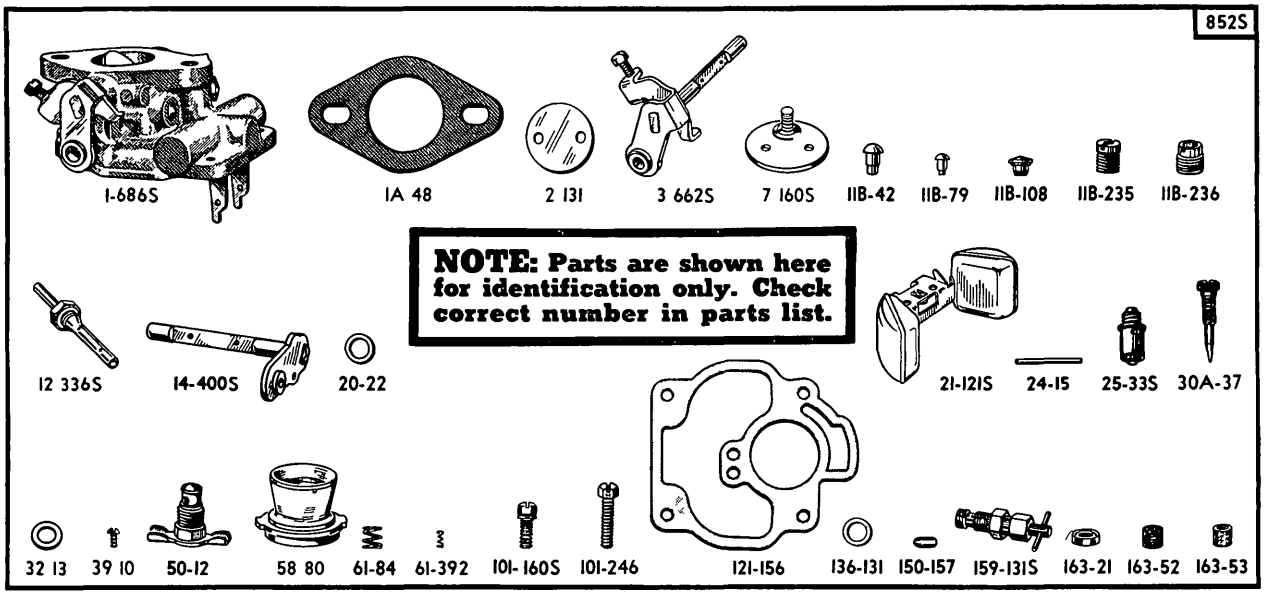
CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS



To secure a good idle Set throttle lever adjusting screw until motor runs approximately 400 r p m Then set idle adjustment screw for highest steady vacuum gauge reading or smoothest engine operation Correct setting will be found between ½ to 1 turn open

High speed adjustment With engine operating at 1650 r p m, adjust high speed adjusting needle until smoothest engine operation is obtained This setting will be found between 1¾ to 2¾ turns open

If motor loads—check float level Wear on lip of float lever will raise float level, causing carbureter to load up To lower float level bend float lever toward needle To raise float level bend lip away from needle A very slight bend is sufficient Bend lip of float only, not bracket **Be sure float is installed with lip of float against needle**

Maximum performance can be secured only when breaker points, spark plugs, valves and motor timing are set to manufacturer s specifications

If carbureter does not respond to the above adjustments, disassemble clean all parts in carbureter cleaner, rinse and blow out all passages with compressed air Replace all worn or damaged parts Always use new gaskets See form No 3525 for complete overhaul procedure

Crosley Carbureter No. 852S

(283) MARK VII, VIII (348) MARK IX, X

AFB Four-Bore Down-Draft Climatic® Control Carbureter No. 2955S

CARBURETER SPECIFICATIONS

For Crusader Marine 8 Cylinder 283 Cu. In. Engine: Vacuum at Idle 18 Inches

For Crusader Marine 8 Cylinder 348 Cu. In. Engine: Vacuum at Idle 18 Inches

Dimensions: Flange, four bore--4 bolt type.
Throttle bore, primary, 1-9/16 inch; secondary 1-11/16 inch I. D.
Primary venturi size, primary side, 7/16 inch; secondary side, 11/32 I. D.
Main venturi size, primary side 1¼ inch, secondary side 1-9/16 inch I. D.

Vents: Inside (4) in air horn; Outside (1) in air horn (4) in body.

Low Speed Circuit: (Primary side only) Jet, size No. 56 (.0465 inch) drill.
By pass, size No. 54 (.055 inch) drill.
Economizer, size No. 60 (.040 inch) drill.
Idle bleed, size (.053 inch) diameter.
Idle port slot type, length .200 inch; width .030 inch.

Idle Port Opening: .156 to .162 inch above top edge of valve with valve tightly closed.

Set Idle Adjustment Screw: ¼ to 1¾ turns open. For Richer mixture turn screw out. Do not idle engine below 550 r.p. m.

Main Nozzle: Installed permanently. DO NOT REMOVE. Antipercolator bleed, primary, (tube in venturi assembly) size No. 80 (.0135 inch) drill. Secondary, (drilled hole in venturi assembly) size No. 60 (.040 inch) drill.

Secondary Inital Discharge: (In venturi assembly, secondary side only).
Pick up tube size No. 60 (.040 inch) drill.
Air bleed, size (.0275 inch) diameter.
Discharge port size (.051 inch) diameter.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 71 (.026 inch) drill. Intake ball check seat (screw plug) size .115 to .120 inch diameter. Discharge needle seat size No. 50 (.070 inch) drill.

Choke: Carter Climatic® Control set on index. Butterfly type--offset choke valve, primary side only. Choke heat suction hole, restriction in body size (.098 inch) diameter.

Vacuum Spark Port: None.

Motor Tune-Up – Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbur t r.

CARBURETER
TRADE MARK REG. U. S. PAT. OFF
MARCA REGISTRADA

PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lev r and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 7/32 inch (Gauge T109-106) between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 33/64 inch from the top of the bowl cover to the top of the plunger shaft. To adjust, bend throttle connector rod.

CHOKE PISTON LEVER ADJUSTMENT: .010 inch (Gauge T109-200) between choke lever and stop in piston housing with choke valve closed. To adjust, bend choke connector rod.

FAST IDLE LINKAGE ADJUSTMENT: With slight clearence between lug on fast idle cam and stop on flange casting, and inner choke shaft lever contacting lug on outer choke shaft lever align index mark on cam with adjusting screw. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .012 inch (Gauge T109-200) between lower edge of valve and bore with adjusting screw on index mark of cam.

UNLOADER: 3/16 inch (Gauge T109-28) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Primary and secondary throttle valves must reach wide open position at the same time. To adjust, bend secondary operating rod. NOTE: Secondary throttle valves will be a few degrees from wide open when primary valves are wide open. Upper edge of secondary valve should just contact auxiliary valve when auxiliary valve is wide open. IMPORTANT: The wide open stop lug on secondary throttle lever should contact boss on flange to prevent secondary valves from going past wide open. If necessary bend stop lug. 2. With primary and secondary throttle valves tightly closed, there should be .010 to .030 inch gauge T109-29 between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.

CARBURETER SPECIFICATIONS

For Dearborn Marine 8 Cylinder Engines:

239 Cu. In. (125) 256 Cu. In. (145) 272 Cu. In. (165)
292 Cu. In. (185) 312 Cu. In. (215)

Dimensions Flange size 1¼ inch 3 bolt
Primary venturi 11/32 inch I D
Secondary venturi 11/16 inch I D
Main venturi 1 5/16 inch I D

Vents. Outside none Inside balance vent tube to air horn ahead of choke valve

Gasoline Intake: Spring loaded needle Size No 48 (076 inch) drill hole in needle seat

Low Speed Jet Tube: Jet size No 69 (0292 inch) drill
By pass in body, size No 56 (0465 inch) drill
Economizer, size (051 inch) diameter

Idle Port: Upper port slot type length 162 inch Width 030 inch

Idle Port Opening: Top of port 124 to 128 inch, above top edge of valve with valve tightly closed Lower port size 0615 to 0655 inch diameter (for idle adjusting screw)

Set Idle Adjustment Screw: ¼ to 1¾ turns open For richer mixture turn screw out Do not idle engine below 700 r p m (in neutral)

Main Nozzle: In primary venturi DO NOT REMOVE Anti percolating jet (in tube) to nozzle size No 70 (028 inch) drill

Metering Rod (Diaphragm Type): See parts list for size

Metering Rod Jet. 0785 inch diameter

Accelerating Pump: Diaphragm type vacuum and mechanically operated Discharge (pump) jet size No 70 (028 inch) drill Intake ball check (in diaphragm housing) seat size 115 120 inch diameter Discharge needle check (in body) seat size 092 inch diameter Vacuum passage restriction (in body) size No 46 (081 inch) drill Vacuum bleed (to throttle bore) size No 65 (035 inch) drill

Choke: Carter Climatic® Control, set on index Butterfly type offset choke valve Choke heat suction hole in piston housing size No 42 (0935 inch) drill

Vacuum Spark Port: Slot type Size 125 by 041 inch Bottom of horizontal port 026 to 036 inch above top edge of valve in closed position

Motor Tune-Up—Be Accurate!

CAUTION· Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .032"	Breaker Point Setting .018"	Ignition Timing Breaker Points to Open: 4° B. T. D. C. At Vibration Damper	Valve Setting (Cold) Intake .019" Exhaust .019"	Float Setting ~~5/16 inch~~ (~~Use gauge~~ T109-107) 7/16 - 109-8	Idle Adjustment Screw Setting ¼ to 1¾ Turns Open Idle Engine at 700 R.P.M. in neutral

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: With gasket removed, bowl cover assembly inverted and float resting on pin in seated needle, the distance from the bowl cover to the top of float should be 5/16 inch (gauge T109-107) Do not depress float lip against spring loaded pin in needle, but let float rest on its own weight Adjust by bending float lever Float setting must be checked with bowl cover held at eye height in a level position

FLOAT DROP: With bowl cover assembly held in upright position, the distance between bottom of float (at free end) and bowl cover should be 2⅜" Adjust by bending stop tab on float arm

METERING ROD ADJUSTMENT: This adjustment is important and should be checked each time the carbureter is reassembled Insert gauge (T109-104) in place of metering rod, seating tapered end of gauge in metering rod jet Hold gauge vertical to insure seating in jet With throttle valve tightly closed, press down on diaphragm shaft until metering rod arm contacts lifter link at diaphragm stem With diaphragm shaft held in this position, metering rod pin must rest lightly on metering rod gauge To adjust, bend metering rod arm Use bending tool T109-22

ACCELERATING PUMP: If acceleration is not satisfactory, remove pump housing, intake rivet plug and ball check

CARBURETER
TRADE MARK REG U S PAT. OFF
MARCA REGISTRADA

PRINTED IN U.S.A.

Examine diaphragm for wear or damage Be sure intake check ball and discharge check needle seats are not clogged with lint or foreign matter Intake ball check and discharge needle must seat, as a leak at these points will result in poor acceleration Inspect and replace all worn parts, clean and blow out all passages with compressed air Pump jet is permanently installed do not remove

FAST IDLE ADJUSTMENT (Early Production only) With thermostatic coil housing, gasket and baffle plate removed, partial open throttle, close choke valve and then close throttle valve This will allow the fast idle cam to revolve to fast idle position With choke valve held tightly closed and slight tension on throttle lever, there should be 015" (Gauge T109-44) clearance between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending connector link at lower angle

UNLOADER ADJUSTMENT: This adjustment must be made after fast idle adjustment Hold throttle valve in wide open position and close choke valve as far as possible without forcing There should be 5/8 inch clearance between lower edge of choke valve (vent tube side) and inner wall of air horn (gauge T109-85) Adjust by bending choke shaft unloader arm (Use bending tool T109 105)

discharge ball checks must seat as a leak at these points will result in poor acceleration Inspect and replace all worn parts clean and blow out all passages with compressed air **Pump jet is permanently installed, do not remove**

FAST IDLE ADJUSTMENT With thermostatic coil housing gasket and baffle plate removed crack throttle valve and hold choke valve fully closed then close throttle valve This will allow the fast idle cam to revolve to fast idle position With choke valve held tightly closed and slight tension on throttle lever there should be 015 inch (gauge T109 44) clearance between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending connector link at lower angle (Use tool T109-213)

UNLOADER ADJUSTMENT This adjustment must be made after fast idle adjustment Hold throttle valve in wide open position and close choke valve as far as possible without forcing There should be 5/8 inch (gauge T109 85) clearance between lower edge of choke valve (vent tube side) and inner wall of air horn Adjust by bending choke shaft unloader arm (Use Bending Tool T109 105)

Dearborn Marine V-8—1955-1956—Carbureters Nos. 2285S-2341S-2528S

BBD Dual Down-Draft Climatic® Control Carbureters Nos. 2793S-2870S-2871S

CARBURETER SPECIFICATIONS

For De Soto 8 Cylinder 360 (MS1); 383 (MS2, MC2) Cu. In. Engine: Vacuum at Idle 19.5 Inches

Dimensions: Flange dual, 4 bolt type. Throttle bore, 1-9/16 inch I. D. Primary venturi, 15/32 inch I. D. Main venturi 1-5/16 inch I. D.

Vent: Inside, in air horn. Outside, none.

Low Speed Circuit: Jet, in venturi assembly, size (.0295 inch) diameter. Idle bleed, in venturi cluster screw, size (.059 inch) diameter. Idle restriction, in venturi cluster screw, size (.051 inch) diameter. Venturi idle bleed, in body, size (.040 inch) diameter. Idle port, slot type, length .198 inch; width .030 inch.

Idle Port Opening: .140 to .144 inch above upper edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size .055 inch diameter.
Set Idle Adjustment Screw: 1/4 to 1 1/4 turns open. For richer mixture, turn screw out. With gear shift in neutral position, idle engine at 500 R. P. M.

Main Nozzle: Nozzle is installed permanently. DO NOT REMOVE.

Main Vent Tube: Side holes 2—size .0292 inch, 1—size .038 inch diameter.

Accelerating Pump: Pump discharge jets (2—in venturi cluster), size .0275 inch diameter. Intake ball check seat, size .130 to .140 inch diameter. Discharge ball check seat, size .110 to .120 inch diameter.

Choke: Carter Climatic® cross over type, set at index. Butterfly type, offset valve. Choke heat suction hole, in air horn, size (.0905 inch) diameter.

Vacuum Spark Port: Horizontal, round end type, .030 by .090 inch. Top of port to be .015 to .025 inch, above upper edge of valve with valve closed tight.

Motor Tune-Up — Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017" Canadian MS2-MC2 .020"	Ignition Timing Breaker Points to Open: 10° B. T. C. At Vibration Damper	Float Setting 5/16 Inch (Use Gauge T109-280)	Idle Adjustment Screw Setting 1/4 to 1 1/4 Turns Open Idle Engine at 500 R. P. M. In Neutral

NOTE: These cars are equipped with Hydraulic Valve Lifters — NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3732

Float Level: 5/16 inch (gauge T109-280) between top of each float ridge (at free end of float) and top surface of body casting. To adjust, bend lip on float arm.

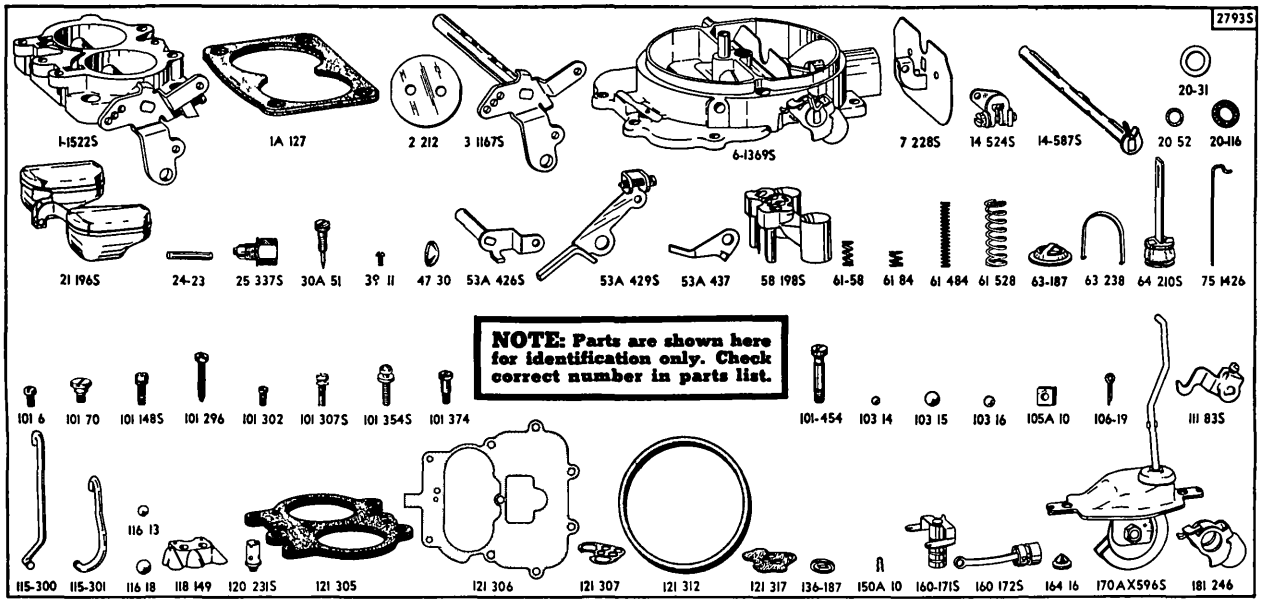
Pump: 1 inch from top of the bowl cover to the top of the plunger shaft. Install throttle connector rod in center hole (medium stroke) of throttle lever. To adjust, bend throttle connector rod. When throttle connector rod is installed in a different hole for seasonal operation the bowl vapor vent must be readjusted.

Fast Idle Linkage Adjustment: With choke valve tightly closed and lug on fast idle cam contacting lip on choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend lip on choke shaft lever.

Fast Idle Throttle Valve Clearance: .018 inch (gauge T109-44) between lower edge of valve and bore with adjusting screw on index mark of cam.

Fast Idle on Car: 1400 R. P. M. hot engine, with fast idle screw on index mark of cam.

Unloader: 15/64 inch (gauge T109-32) between top edge of choke valve and inner wall of air horn with throttle valve wide open. To adjust, bend unloader finger on fast idle arm.



Bowl Vapor Vent Adjustment: .062" to .093" (gauge T109-234) between the heel of the rubber grommet and its seat on the bowl cover with throttle valve seated. To adjust, bend lip on vapor vent arm. If the pump has been changed to the long or short stroke readjust the bowl vapor vent.

1959

Also used on Dodge, Models MD2, MD3 and Canadian De Soto, Model MS2— Canadian Chrysler, Model MC2

AFB Four-Bore Down-Draft Climatic® Control Carbureter No. 2794S

CARBURETER SPECIFICATIONS

For De Soto 8 Cylinder 383 Cu. In. Engine: Vacuum at Idle 19.5 Inches

Dimensions: Flange, four bore—4 bolt type.
Throttle bore, primary, 1-7/16 inch; secondary 1-9/16 inch.
Primary venturi size, primary side, 7/16 inch, secondary side, 11/32 inch I. D.
Main venturi, primary, 1-3/16 inch; secondary, 1-5/16 inch.

Vents: Inside (4) in air horn: Oustide (5) in air horn.

Low Speed Circuit: (Primary side only)
Jet, size No. 66 (.033 inch) drill.
By-pass, size (.0492 inch) diameter.
Economizer, size (.0452 inch) diameter.
Idle bleed, size (.0492 inch) diameter.
Idle port, slot type, length .198 inch, width .030 inch.

Idle Port Opening: .167 to .173 inch above top edge of valve with valve tightly closed.

Set Idle Adjustment Screw: 1/2 to 2 turns open. For richer mixture turn screw out. Do not idle engine below 500 R. P. M. Transmission in neutral.

Main Nozzle: Install permanently. DO NOT REMOVE. Antipercolator bleed, primary (tube in venturi assembly), size No. 68 (.031 inch) drill. Secondary (drilled hole in venturi assembly) size No. 60 (.040 inch) drill.

Main Vent Tube: (In venturi assembly) Side holes primary side 11—size No. 70 (.028 inch) 1—size No. 65 (.035 inch) drill; secondary side 2—size No. 57 (.043 inch) 1—size No. 70 (.028 inch) drill.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 68 (.031inch) drill. Intake ball check seat (screw plug) size .115 to .120 inch diameter. Discharge needle seat size No. 50 (.070 inch) drill.

Choke: Carter Climatic® Control Cross Over type, set on index. Butterfly type offset valve, primary side only. Choke heat suction hole, in air horn, size No. 44 (.086 inch) drill.

Vacuum Spark Port: Slot type (round end) .045 x .110 inch. Top of port .026 to .034 inch above top edge of valve with valve tightly closed.

Motor Tune-Up — Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017" Canadian MS2, MC2 .020"	Ignition Timing Breaker Points to Open: 10° B. T. C. At Vibration Damper	Float Setting (See Adjustments)	Idle Adjustment Screw Setting 1/2 to 2 Turns Open 500 R. P. M. In Neutral

NOTE: These cars are equipped with Hydraulic Valve Lifters — NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3733

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 7/32 inch (gauge T109-106) plus or minus 1/64 inch, between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch plus or minus 1/16 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 7/16 inch from the top of the bowl cover to the top of the plunger shaft with throttle connector rod in center hole (medium stroke) of pump arm. To adjust, bend throttle connector rod.

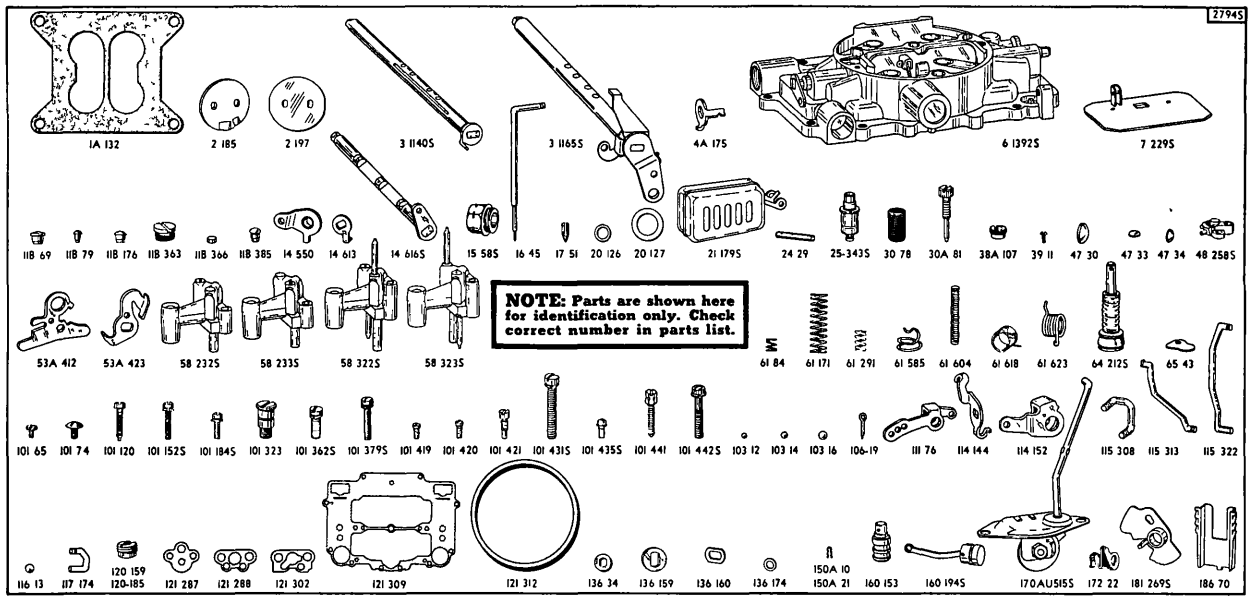
FAST IDLE LINKAGE ADJUSTMENT: With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .015 inch (gauge T109-44) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 1400 R. P. M. hot engine with fast idle screw on index mark of cam.

UNLOADER: 1/4 inch (gauge T109-31) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 3/8 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: At wide open throttle primary and secondary valves will reach full vertical position. 3. With primary and secondary throttle valves in tightly closed position there should be .010" to .030" (gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.



SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.

CHOKE ADJUSTMENT (CROSS OVER TYPE) SEE FORM 3691: 1. Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page. Hold in this position with screw driver and tighten lock nut. NOTE: Screw driver may be held in vise so that one hand may be used to support housing while tightening nut. 2. After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover. If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without affecting calibration.

(Also used on Dodge, Models LD3, LD3-D500)

AFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2773S**

CARBURETER SPECIFICATIONS

For DeSoto 8 Cylinder 350 (LS-1 and LD3), 360 (D500) Cu. In. Engine: Vacuum at Idle 19.5 Inches

Dimensions: Flange, four bore—4 bolt type
Throttle bore 1 7/16 inch
Primary venturi size primary side 7/16 inch secondary side 7/16 inch I D
Main venturi size, 1-3/16 inch.

Vents: Inside (4) in air horn, Outside (4) in body, (5) in air horn

Low Speed Circuit: (Primary side only)
Jet, size No 065 (.035 inch) drill
By-pass size (.0492 inch) diameter
Economizer, size (.0452 inch) diameter
Idle bleed, size (.0492 inch) diameter
Idle port, slot type, length .198 inch, width .030 inch.

Idle Port Opening: .142 to .148 inch above top edge of valve with valve tightly closed

Set Idle Adjustment Screw: 3/4 to 2 1/4 turns open For richer mixture turn screw out Do not idle engine below 500 r p m Transmission in neutral

Main Nozzle Install permanently DO NOT REMOVE Anti-percolator bleed primary (tube in venturi assembly), size No 68 (.031 inch) drill Secondary (drilled hole in venturi assembly) size No 70 (.028 inch) drill Bleed to main vent tube passage size No 69 (.029 inch) drill

Main Vent Tube: (In venturi assembly) Side holes primary side 5—size No 70 (.028 inch) 1—size No 65 (.035 inch) drill secondary side 11—size No 70 (.028 inch) drill

Accelerating Pump. Discharge jet (twin) primary side only size No 68 (.031 inch) drill Intake ball check seat (screw plug) size .115 to .120 inch diameter Discharge needle seat size No 50 (.70 inch) drill

Choke: Carter Climatic® Control Cross Over Type set 2 points rich Butterfly type offset valve, primary side only Choke heat suction hole, in air horn, size No 44 (.086 inch) drill

Vacuum Spark Port: Slot type (round end) .045 x .110 inch Top of port .026 to .034 inch above top edge of valve with valve tightly closed

---

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open: 6° B. T. C. 10° B. T. C. (Export DeSoto) At Vibration Damper	Float Setting 7/32 Inch (Use Gauge T109-106)	Idle Adjustment Screw Setting 3/4 to 2 1/4 Turns Open 500 R. P. M. In Neutral

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3733

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 7/32 inch (gauge T109-106) between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 7/16 inch from the top of the bowl cover to the top of the plunger shaft with throttle connector rod in center hole (medium stroke) of pump arm. To adjust, bend throttle connector rod.

FAST IDLE LINKAGE ADJUSTMENT: With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .012 inch (gauge T109-200) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 1400 R. P. M. hot engine with fast idle screw on index mark of cam.

UNLOADER: 1/4 inch (gauge T109-31) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 3/8 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: at wide open throttle primary and secondary valves will reach full vertical position. 3. With primary and secondary throttle valves in tightly closed position there should be .010" to .030" (gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.

CHOKE ADJUSTMENT (CROSS OVER TYPE) SEE FORM 3691: 1. Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page. Hold in this position with screw driver and tighten lock nut. NOTE: Screw driver may be held in vise so that one hand may be used to support housing while tightening nut. 2. After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover. If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without affecting calibration.

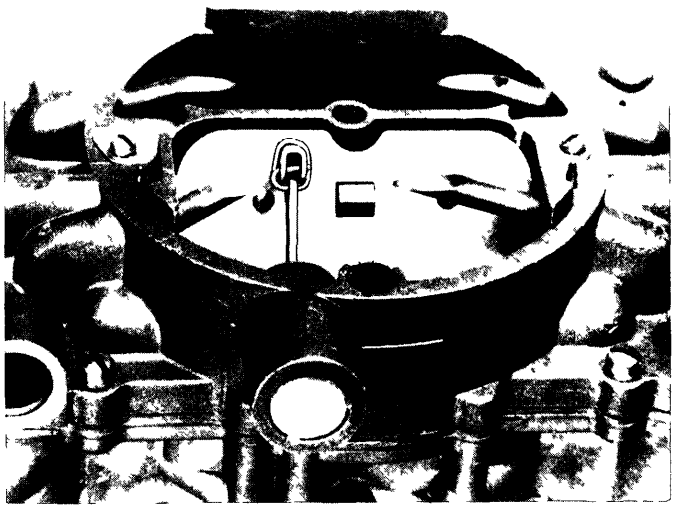
GENERAL BULLETIN



CARBURETER CONTRACT ACCOUNTS
FACTORY, P.I. & P.C.T. GRADUATES

BULLETIN NO. 16 DeSoto
DATE February 17, 1958

SUBJECT: 1958 DESOTO PERFORMANCE COMPLAINTS

STALLING ON ACCELERATION WITH A COLD ENGINE AFB-2642S FOUR BORE CARBURETER

Complaints have been received of the engine stalling after the initial start and upon the first few accelerations during the warm-up period. This difficulty has been traced to the choke valve being pulled open too far by the choke piston.

The following field modification has proven effective:

1. Remove the air cleaner. Hold the choke valve closed and take out the cotter pin attaching the choke piston link to the bracket on the choke valve.
2. Obtain a piece of straight wire 1-3/4 inches long and approximately .060 inches in diameter (1/16" welding rod), and pass one end through the two holes in the bracket on the choke valve so that it protrudes 1/8 inch on the other side. Bend the long end of the wire around the bottom of the bracket, forming a "U" with unequal length sides. Remove the wire from the bracket. Pass the long end through the hole in the piston link and the short end through the holes in the bracket. With the wire held tight against the bracket, fold the long end up behind the extension of the short end and over the top of the bracket, as shown in the illustration.

ACCELERATION COMPLAINTS (ENGINE AT OPERATING TEMPERATURE)

A few complaints have been received concerning a lag or flat spot in part throttle acceleration on 1958 DeSotos equipped with either the BBD-2637S Dual or AFB-2642S carbureters. The following carbureter changes will provide a slightly richer mixture to help overcome these complaints.

(over)

BBD-2637S DUAL CARBURETER

Install two (2) 75-998 (.027") step-up rods in place of the original 75-999 (.029") rods.

AFB-2642S FOUR BORE CARBURETER

Install two (2) 120-155 (.091") primary metering jets in place of the original 120-159 (.089") jets. The 120-155 jets are installed in the primary high speed circuit. A richer than standard step-up rod part 16-70 will be available shortly for the AFB-2642S carbureter. It may be used instead of the 120-155 jet. CAUTION - do not use the 16-70 step-up rod with the 120-155 jet as an excessively rich mixture will result.

Parts 75-998 and 120-155 have been used in other model carbureters and should be available in field stocks, however, an initial shipment of a limited number of each part is being made to Carter Central Distributors.

Carter warranty is not involved in either the choke or metering correction.

BBD Dual Down-Draft Climatic® Control **Carbureter No. 2822S**

CARBURETER SPECIFICATIONS

For De Soto 8 Cylinder 350 (LS1), 360 (LS2) Cu. In. Engine: Vacuum at Idle 19.5 Inches

Dimensions: Flange dual, 4 bolt type. Throttle bore, 1-9/16 inch I D Primary venturi, 15/32 inch I. D Main venturi 1-5/16 inch I D

Vent: Inside, in air horn. Outside (2) in flange above throttle valve

Gasoline Intake: Size No 34 (111 inch) drill hole in needle seat.

Low Speed Circuit: Jet in venturi assembly, size (0295 inch) diameter Idle bleed, in venturi cluster screw, size (059 inch) diameter. Idle restriction, in venturi cluster screw, size (051 inch) diameter. Venturi idle bleed, in body, size (0355 inch) diameter. Idle port, slot type, length .198 inch, width 030 inch.

Idle Port Opening: 140 to .144 inch above upper edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size 055 inch diameter.

Set Idle Adjustment Screw: 1/4 to 1 1/4 turns open For richer mixture turn screw out With gear shift in neutral position idle engine at 500 R P M

Main Nozzle: Nozzle is installed permanently DO NOT REMOVE

Main Vent Tube: Side holes 3—size 0292 inch 1—size 038 inch diameter

Accelerating Pump: Pump discharge jets (2—in venturi cluster), size 0275 inch diameter Intake ball check seat, size 130 to 140 inch diameter Discharge ball check seat size 110 to 120 inch diameter

Choke: Carter Climatic® Control cross over type, set at index Butterfly type, offset valve Choke heat suction hole, in air horn, size (0905 inch) diameter

Vacuum Spark Port: Horizontal, round end type, 030 by 090 inch Top of port to be 015 to 025 inch, above upper edge of valve with valve closed tight

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3733

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 5/16 inch (gauge T109-107) for 21-188S floats (identify by smooth sides); 7/32 inch (gauge T109-106) for 21-179S floats (identify by ribs on floats) between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 7/16 inch from the top of the bowl cover to the top of the plunger shaft with throttle connector rod in center hole (medium stroke) of pump arm. To adjust, bend throttle connector rod.

FAST IDLE LINKAGE ADJUSTMENT: With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

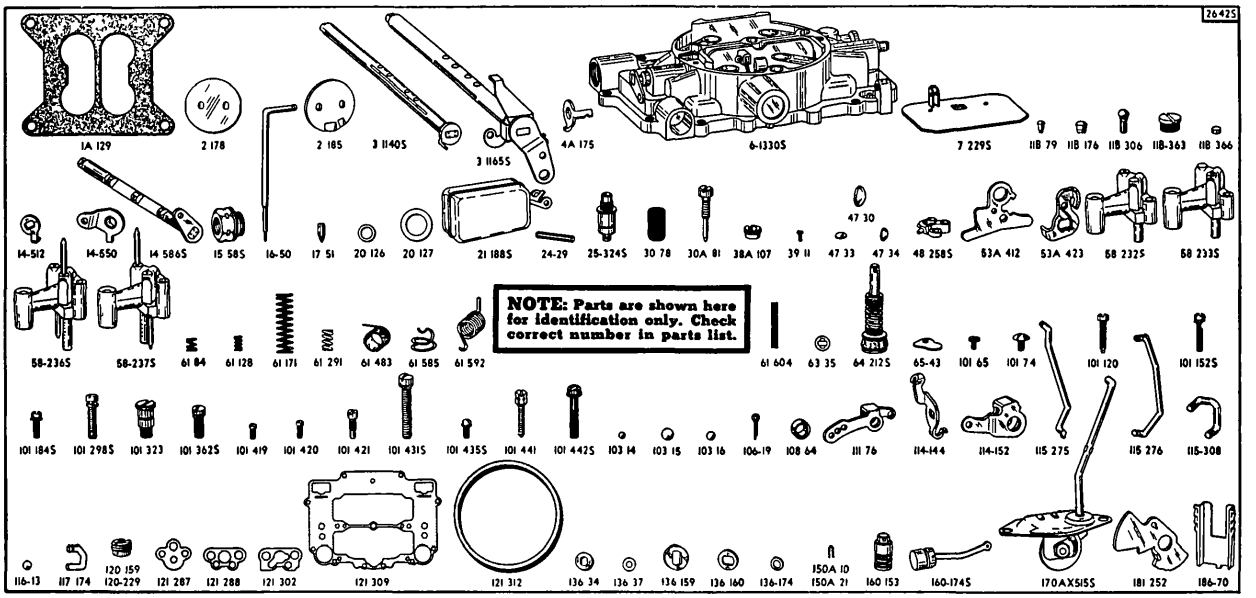
FAST IDLE THROTTLE VALVE CLEARANCE: .012 inch (gauge T109-200) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 1400 R. P. M. hot engine with fast idle screw on index mark of cam.

UNLOADER: 1/4 inch (gauge T109-31) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 3/8 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: at wide open throttle primary and secondary valves will reach full vertical position. 3. With primary and secondary throttle valves in tightly closed position there should be .010" to .030" (gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.



CHOKE ADJUSTMENT (CROSS OVER TYPE) SEE FORM 3691: 1. Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page. Hold in this position with screw driver and tighten lock nut. NOTE: Screw driver may be held in vise so that one hand may be used to support housing while tightening nut. 2. After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover. If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without affecting calibration.

TOOLS REQUIRED FOR SERVICING CARBURETERS:

T109-29	.020" Wire gauge	T109-106	7/32" Float gauge (late)
T109-31	1/4" Unloader gauge	T109-107	5/16" Float gauge (early)
T109-41	Bending tool	T109-200	.012" Wire gauge

T109-213 Bending tool

CARTER MODEL AFB CARBURETER FOR DESOTO (SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the base of the carbureter, when requesting specification pages.

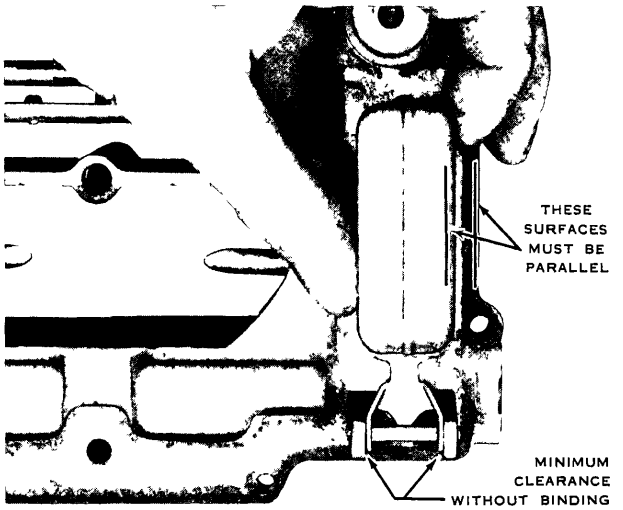

Figure 1

FLOAT ALIGNMENT ADJUSTMENT (Fig. 1):

1. Sight down the side of the float shell to determine if the side of the float is parallel to the outer edge of the air horn casting. TO ADJUST: Bend float lever by applying pressure to the end of the float shell with the fingers while supporting the float lever with the thumb.

   CAUTION: To avoid damaging the float, apply only enough pressure to bend float lever.

2. After aligning float, remove as much clearance as possible between arms of float lever and lugs on air horn by bending the float lever. Arms of float lever should be as parallel to the inner surfaces of lugs on air horn as possible.

   Floats must operate freely without excess clearance on its hinge pin.

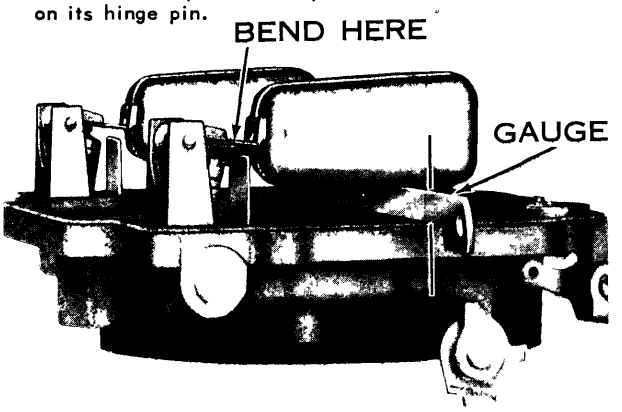

Figure 2

FLOAT LEVEL ADJUSTMENT (Fig. 2):

With air horn inverted, bowl cover gasket in place and needle seated, the clearance between top of float (at out r end) and air horn gasket should be as list d on carbur ter specification page. To adjust, bend float arm. Adjust both floats. Recheck float alignm nt.

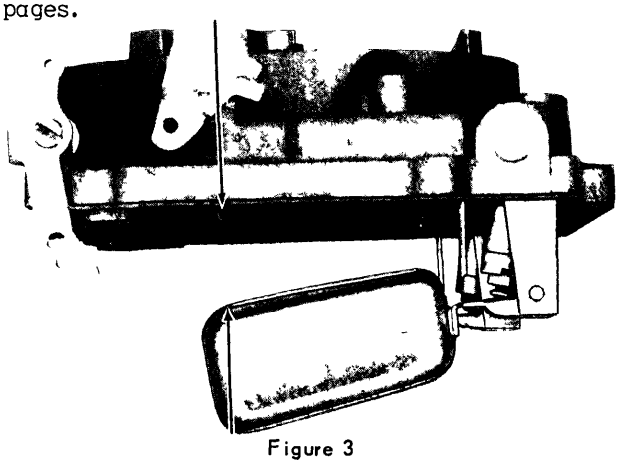

Figure 3

FLOAT DROP ADJUSTMENT (Fig. 3):

With bowl cover held in upright position and measuring from outer end of each float, the distanc b twe n top of floats and bowl cover gasket should be as listed on carbureter specification page. To adjust, bend st p tabs on float brackets.

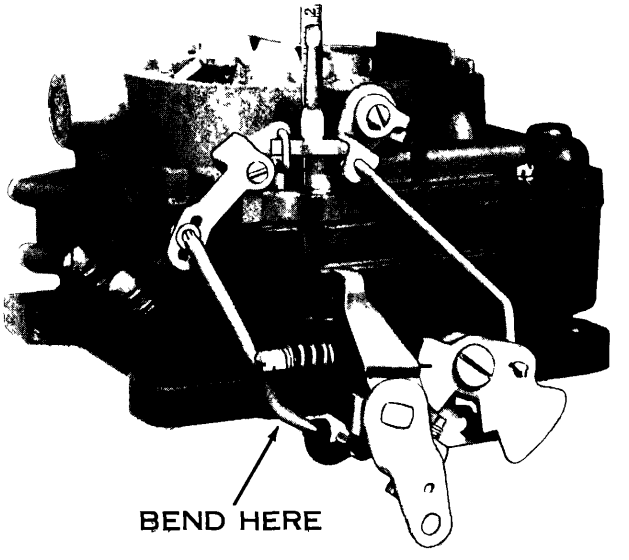

Figure 4

PUMP ADJUSTMENT (Fig. 4):

1. Back out idle speed screw until throttle valv s seat in bores of carbureter. NOTE: Be sur fast idle adjusting screw does not contact fast idle cam and hold throttle valves open.
2. With throttle connector rod in center hole (medium strok) of pump arm, the distance from the top of the bowl cover to the top of the plunger shaft should b as listed on carburet r specificati n page.
3. Adjust by bending throttle connector rod at lower angle (use tool T109-213).

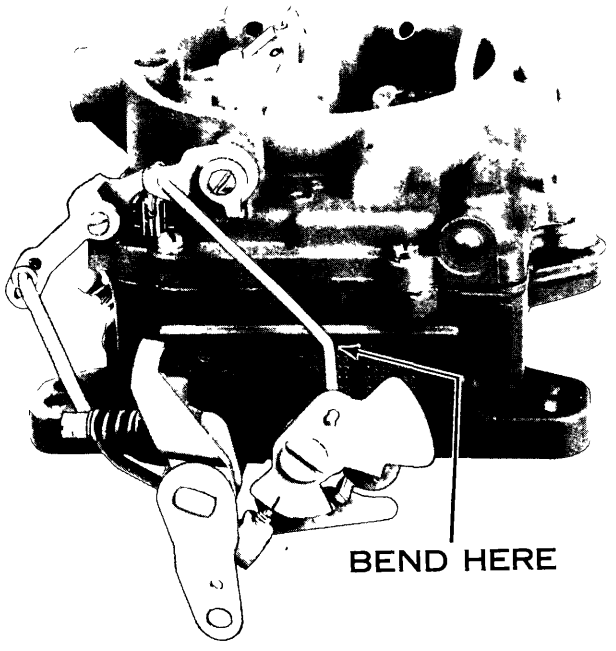

Figure 5

FAST IDLE LINKAGE ADJUSTMENT (Fig. 5):

With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod. (Use tool T109-213.)

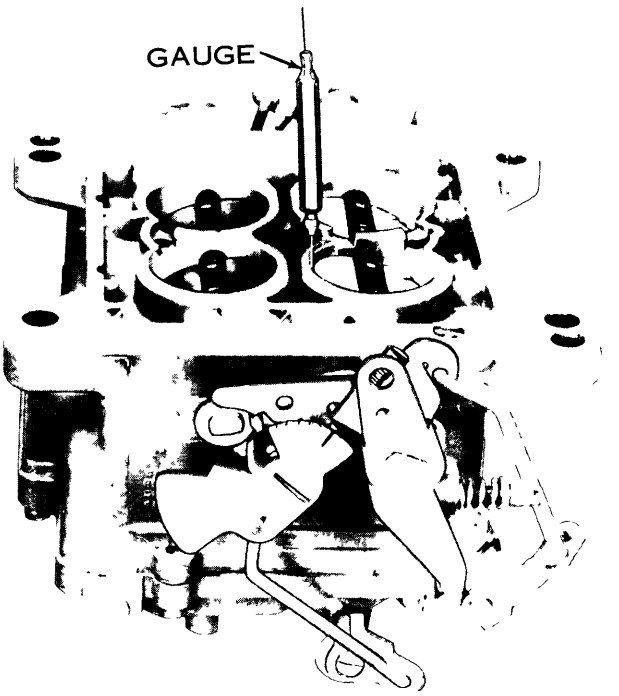

Figure 6

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 6):

With choke valve tightly closed, tighten fast idle adjusting screw (on index mark of cam) until the clearance between throttle valve and bore of carbureter, side opposite idle port, is as listed on carbureter specification page.

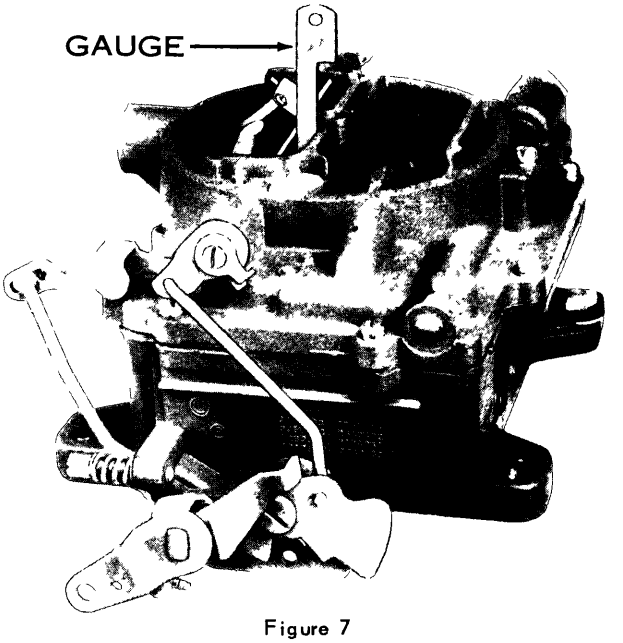

Figure 7

UNLOADER ADJUSTMENT (Fig. 7):

With throttle wid open, the clearanc between upp r edge of choke valve and inner wall of air horn should b as listed on carbureter specification pag . To adjust, bend unloader lip on throttle shaft lever. (Use tool T109-41.)

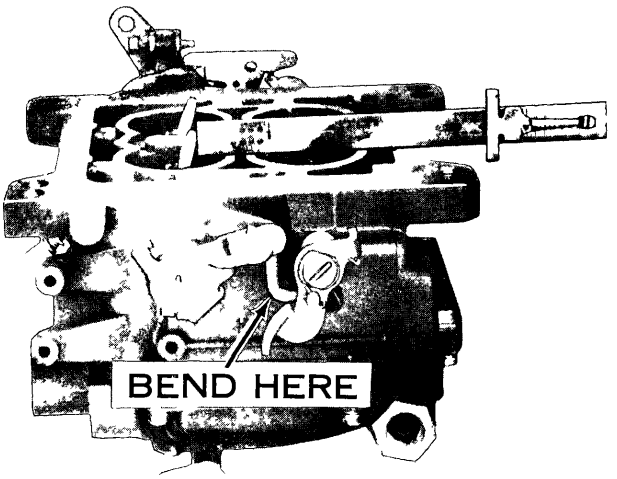

Figure 8A

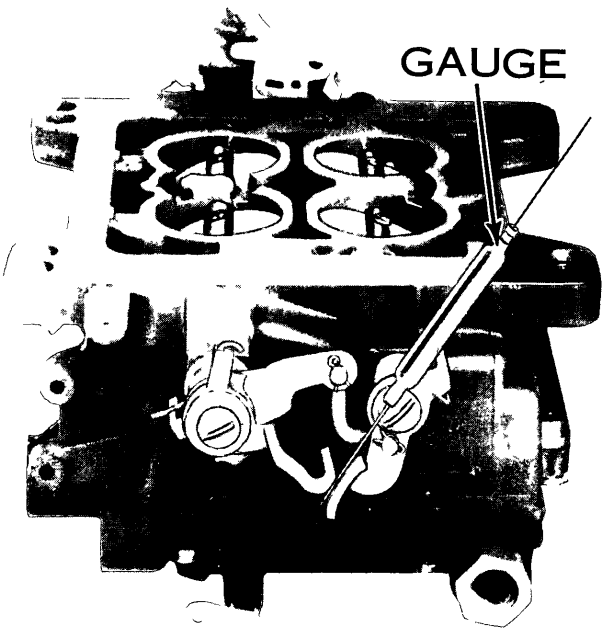

Figure 8B

SECONDARY THROTTLE LEVER ADJUSTMENT (Figs. 8A & 8B):

1. Block choke valve wide open.
2. Secondary throttle valves should just start to open when primary throttle valves are opened to the clearance as listed on specification page between lower edge of valve and bore (opposite idle port). To adjust, bend throttle operating rod. (Use bending tool T109-213). (See Fig. 8A) NOTE: Primary and secondary throttle valves should reach wide open position, full vertical, at the same time.
3. With primary and secondary throttle valves in tightly closed position, there should be the clearance as listed on specification page between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever. (See Fig. 8B)

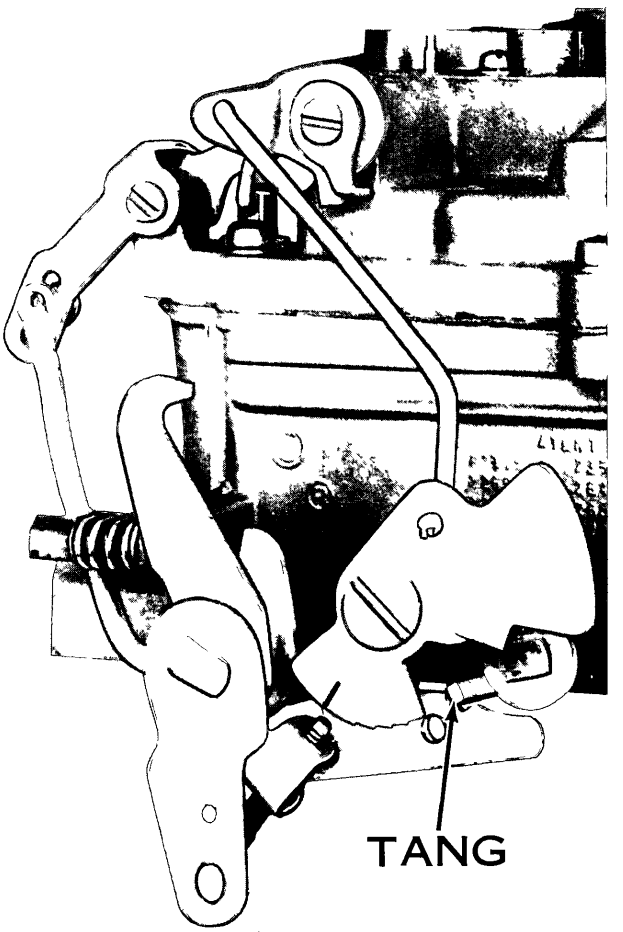

Figure 9

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 9):

Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. If necessary to adjust, bend tang on secondary throttle lever.

NOTE: See last page for pertinent service information.

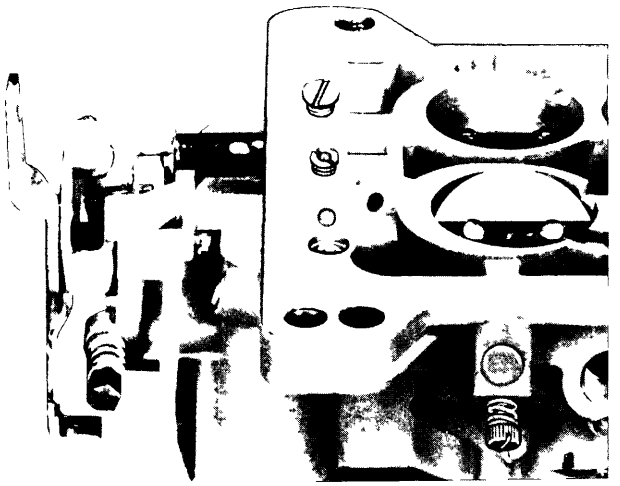

Figure 10

(Fig. 10):

Pump intake check ball, seat and screw plug are removed by inverting carbureter and removing from lower side of flange.

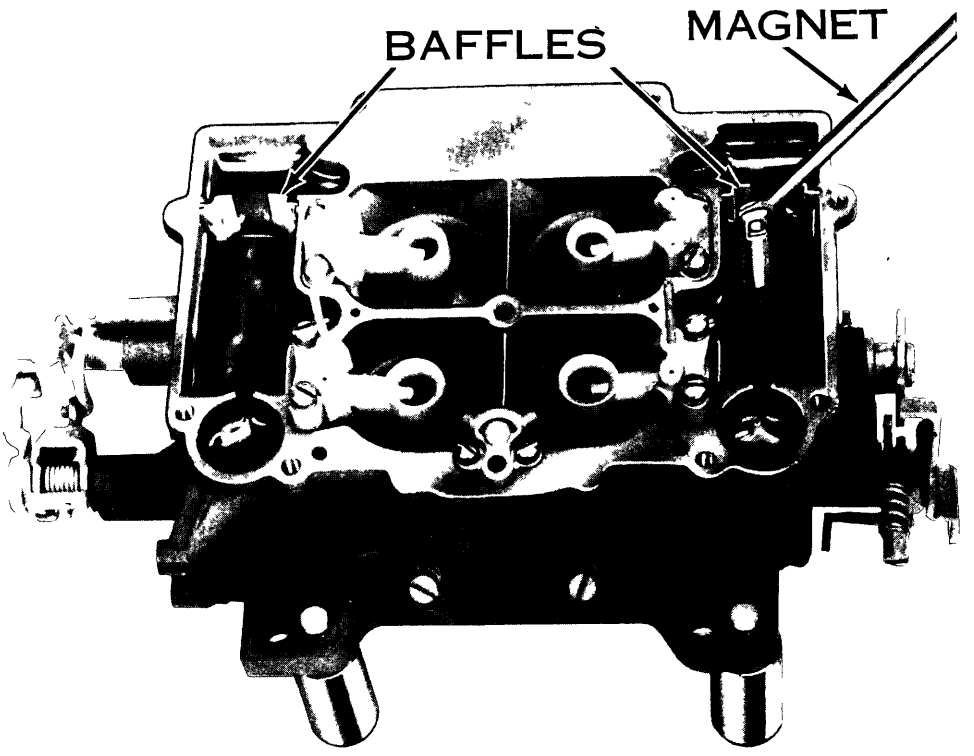

Figure 11

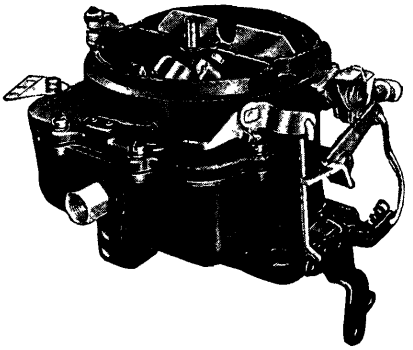
(Fig. 11):

Flooding, stumble on acceleration and other performance complaints are, in many instances, caused by the presence of dirt, water or other foreign matter in the carbureter. To aid in diagnosing the cause of the complaint, the carbureter should be carefully removed from the engine without draining the fuel from the bowl. The contents of the fuel bowl may then be examined for contamination as the carbureter is disassembled.



Check the fuel in the bowl for contamination by dirt, water, gum or other foreign matter. A magnet moved through the fuel in the bowl will pick up and identify any iron oxide dust that may have caused intake needle and seat leakage.

Inspect gasketed surfaces between body and air horn. Small nicks or burrs should be smoothed down to eliminate air or fuel leakage. Be especially particular when inspecting the top surface of the inner wall of the bowl around the vacuum piston passage. A poor seal at this location may contribute to a "cutting-out" on turns complaint.

Install fuel baffles as shown (Fig. 11) to prevent damage to floats. Use caution when installing air horn assembly. Baffles on air horn assembly must fit inside of fuel bowl baffles toward primary side of carbureter.

Fill the carbureter bowl with clean fuel before installing on the manifold. This will help prevent dirt trapped in the fuel system from being dislodged by the free flow of fuel as the carbureter is primed. The operation of the floats and intake needle and seats may be checked under pressure if a fuel pump is used at the bench to fill the carbureter bowl. Operate the throttle several times and visually check the discharge from the pump jets.

Before installing the carbureter, hold choke valve open and turn the idle speed screw until it just contacts the throttle lever, then 1/2 a turn more to open the throttle valves enough to keep the engine running until the idle mixture and final R.P.M. adjustment can be made.

Form 3732
October, 1957

CARTER CARBURETOR

DIVISION OF acf INDUSTRIES INCORPORATED
ST. LOUIS, MO., U. S. A.

File Under DeSoto

CARTER MODEL BBD CARBURETER FOR DESOTO
(SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the brass identification tag, when requesting specification pages.

Figure 1

FLOAT ADJUSTMENT (Fig. 1):

This adjustment must be made with the bowl cover gasket removed. Hold the lip on float arm against the seated intake needle, making sure the fl at pin is at the bottom of its guide slots. The distance (A) from the top surface of the body casting to the top of each float (at free end) should be as listed on carbureter specification page. If one float is lower than the other, equalize by bending the float arm. If b th floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywh re against the inner walls of the bowl. If necessary, bend float arms slightly to provide clearanc n all sides of floats.

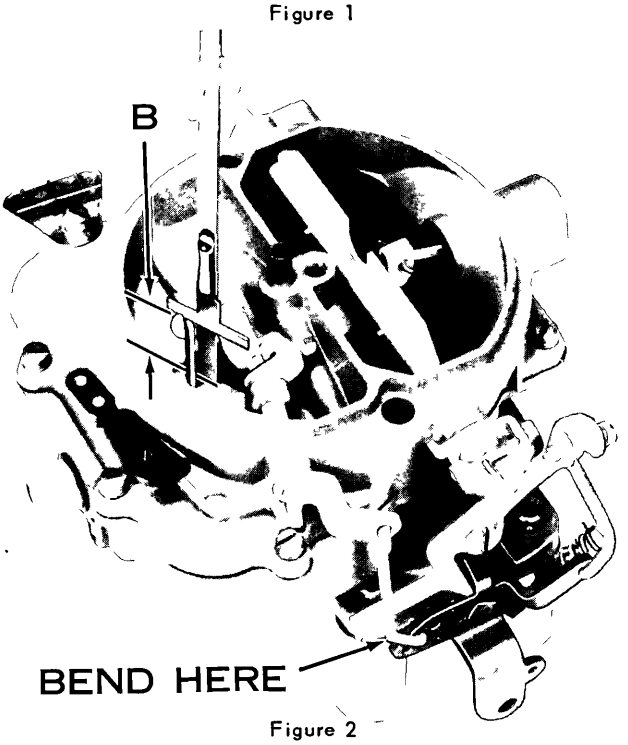

Figure 2

PUMP ADJUSTMENT (Fig. 2):

1. Back out throttle adjustment screw and open choke valve so that throttle valves seat in bores of carbureter.
2. Install throttle connector rod in the hole in the throttle lever specified on carbureter specification page.
3. The distance (B) from the top of the bowl cover to th top of the plunger shaft should be as specified on carbur t r sp cification pag .
4. Adjust by b nding pump c nnector rod. (Us bending tool T109-213)

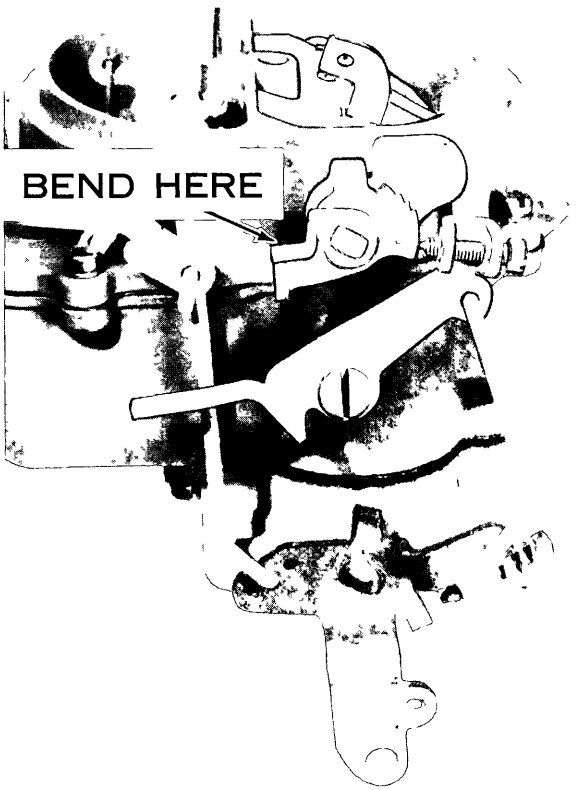

Figure 3

FAST IDLE LINKAGE ADJUSTMENT (Fig. 3):

With choke valve tightly closed and lug n fast idl cam contacting lip n choke shaft l ver align center of fast idle scr w with index mark on cam. To adjust bend lip on choke shaft l ver (use to l T109-22).

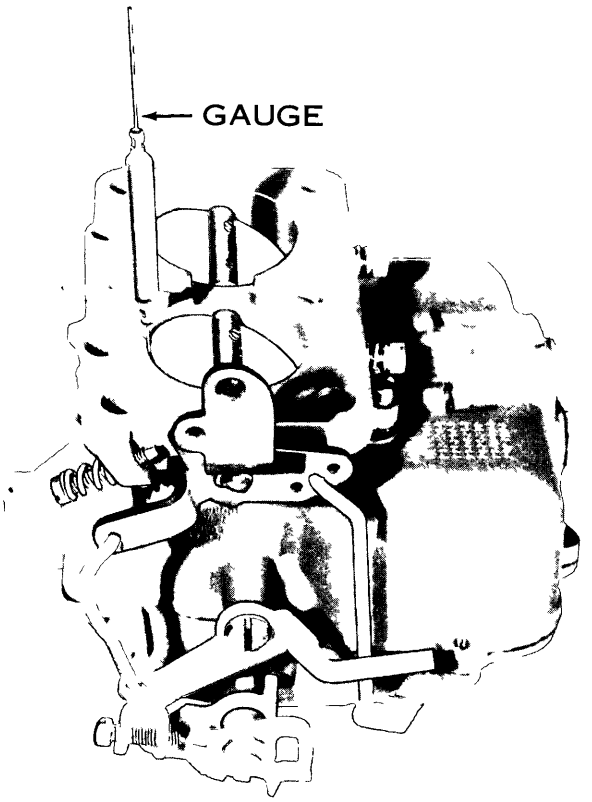

Figure 4

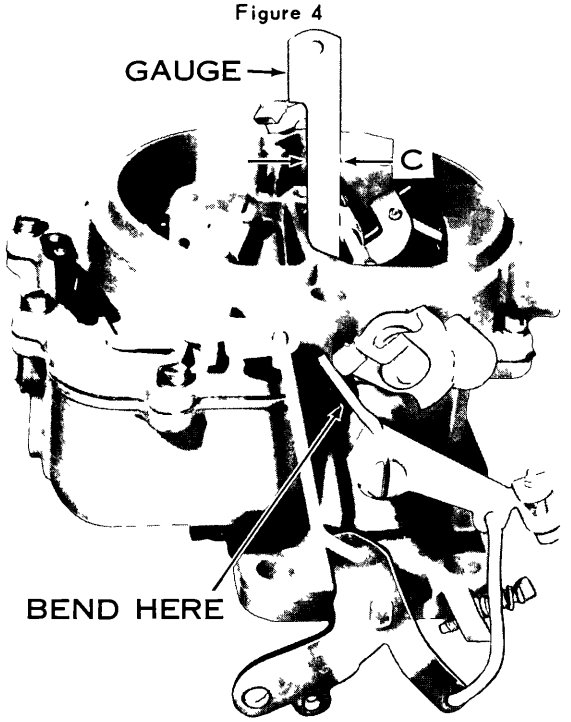

Figure 5

UNLOADER ADJUSTMENT (Fig. 5):

1. Hold throttl valves wide open.
2. Close choke valve as far as possible without forcing.
3. Clearance (C) between top edge of choke valve and inner wall of air horn should be as listed on carbur t r sp cificatıon page.
4. Adjust by bending unloader finger n fast idle arm. (Use tool T109-22).

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 4):

1. Be sure choke valve is closed.
2. Adjust fast idle adjusting screw against index mark of cam (revolve cam if necessary) until the clearance between throttle valve (side opposite port) and bore is as listed on carbureter specification page.

Figure 6

BOWL VAPOR VENT ADJUSTMENT (Fig. 6):

With throttle valve tightly closed the clearance between the heel of the rubber grommet and its seat on the bowl cover should be as listed on carbureter specification page. To adjust, bend lip on vapor vent arm (Use tool T109-22)

CAUTION:

When servicing carbureter use elevating legs (T109-289U) to prevent damaging throttle valves.

WCFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2532S**

CARBURETER SPECIFICATIONS

For DeSoto 8 Cylinder Engine: 3.6875 Inch Bore, 3.8 Inch Stroke

Dimensions: Flange size 1¼ inch Four Bore—4 bolt type
Primary venturi size, 11/32 inch I. D
Main venturi size 1-3/16 inch I D

Vents: Inside, (5).

Gasoline Intake: Size No 42 (0935 inch) drill in needle seat

Low Speed Jet Tube Jet size (035 inch) diameter By-pass, tube in body size (057 inch) diameter Economizer plug in body size (0492 inch) diameter Idle bleed, in body, size No 46 (081 inch) drill

Idle Port. Upper slot type, primary length 140 inch, width 030 inch Secondary, length 103 inch; width 030 inch

Idle Port Opening: Primary 092 to 098 inch, secondary 065 to 071 inch above top edge of valve with valve tightly closed

Lower Port: Primary (for idle adjustment screw), size No 53 (0595 inch) drill Secondary (no idle adjustment screw), size No 57 (043 inch) drill.

Set Idle Adjustment Screw: ½ to 1½ turns open For richer mixture turn screw out Do not idle engine below 500 R P M in neutral.

Main Nozzle: Installed permanently DO NOT REMOVE Anti percolating jet (4) size No 70 (028 inch) drill

Metering Rod: (Vacumeter type) see parts list for size

Metering Rod Jet: Primary Size 0945 inch diameter Sec ondary Size 067 inch diameter

Accelerating Pump: Discharge jet (twin) primary side only size No 74 (0225 inch) drill Intake ball check seat, size 115 to 120 inch diameter Discharge needle seat size No 50 (070 inch) drill Relief passage (vent) to fuel chamber size No 42 (0935 inch) drill

Choke: Carter Climatic® Control Cross Over Type set on index Butterfly type offset choke valve primary side only Choke heat suction hole restriction in piston housing, size No 40 (098 inch) drill

Vacuum Spark Port: Horizontal slot (round end) 045 x 110 inch Top of port 022 to 032 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open 6° B. T. D. C. At Vibration Damper	Float Setting See Adjustments	Idle Adjustment Screw Setting ½ to 1½ Turns Open Idle engine at 500 R.P.M. in neutral

CARBURETER
TRADE MARK REG U. S. PAT. OFF.
MARCA REGISTRADA

S S PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. **VERTICAL ADJUSTMENT:** With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 7/32" (gauge T109-283) for primary floats; and 9/32" (gauge T109-284) for secondary floats. Adjust by bending float arms.

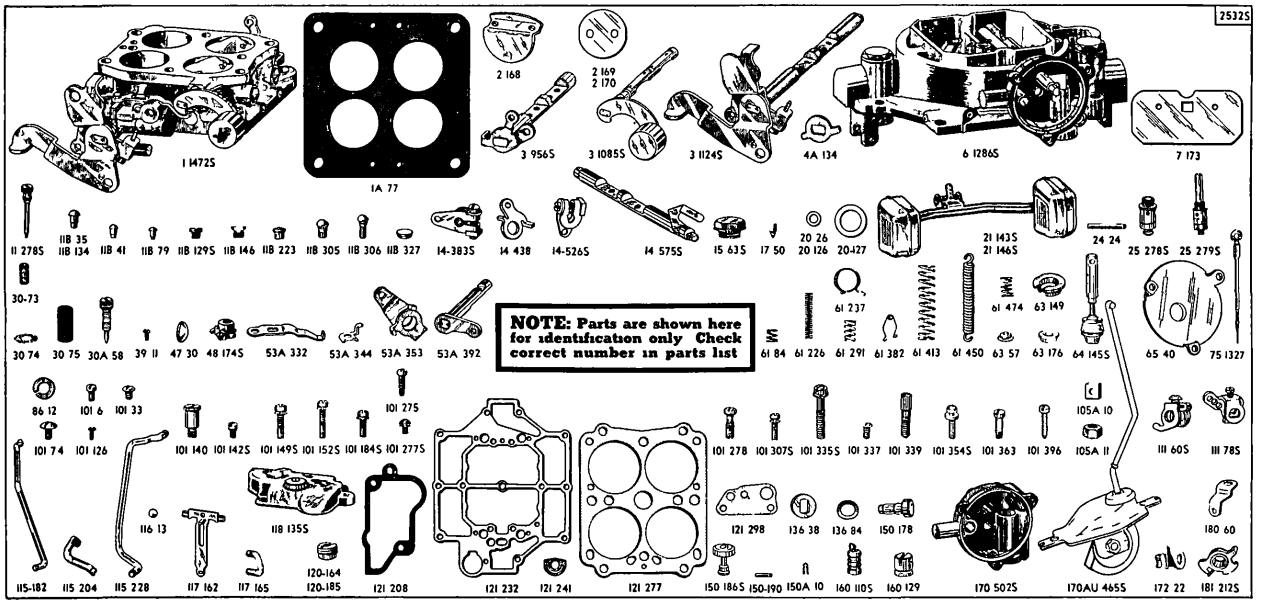
FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of floats, the distance between top of floats and bowl cover should be 23/32" for primary floats and 25/32" for secondary floats. Adjust by bending stop tabs on float bracket.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020" feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing lever towards closed position — hold in place and tighten clamp screw. (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is .010" (gauge T109-200) opening between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam while making this adjustment.



FAST IDLE ON CAR: 1350 to 1400 R.P.M.

UNLOADER ADJUSTMENT: With throttle wide open there should be 11/64" clearance between upper edge of choke valve and inner wall of air horn (gauge T109-166). Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LEVER ADJUSTMENT: The stop lug on both primary and secondary throttle levers should contact boss on flange at the same time. To adjust bend secondary throttle operating rod at angle (use bending tool T109-213).

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle adjustment. 1. With choke valve closed, edge of hook on lockout arm should contact auxiliary throttle lever, making maximum contact of locking step on lever. 2. Open choke valve. Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position. Adjust by bending lockout arm.

CHOKE ADJUSTMENT (CROSS OVER TYPE) See Form 3691: 1. Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page. Hold in this position with screw driver and tighten lock nut. NOTE: Screw driver may be held in vise so that one hand may be used to support housing while tightening nut. 2. After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover. If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without affecting calibration.

DeSoto "V-8"—1957—Carbureter No. 2532S

WHEN SERVICING, USE GASKET ASSORTMENT No 299, REPAIR PACKAGE No 1859

NOTE **Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown, only one is used**

CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

CARTER CLIMATIC® CONTROL CROSS OVER CHOKE TYPE
(SERVICE INFORMATION AND ADJUSTMENT PROCEDURE)

NOTE: Coil housing and rod assembly may be cleaned in carbureter parts cleaner without disassembling. After cleaning rinse in solvent and blow out inside of housing with compressed air. After rinsing make sure housing revolves freely on mounting post. If disassembly is necessary for thorough cleaning, follow steps under "reassembly" to be sure coil is installed properly.

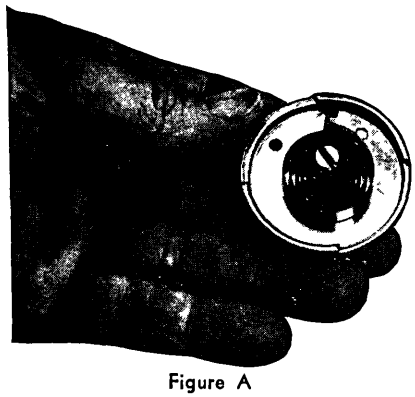

Figure A

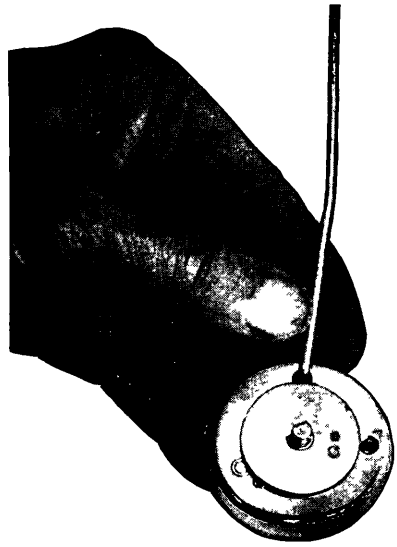

Figure B

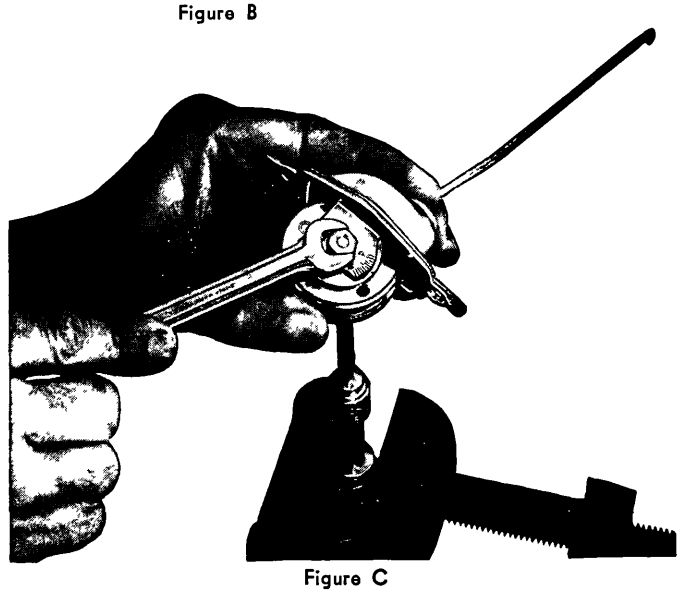

Figure C

TWO PIECE CLOSED HOUSING

REASSEMBLY:

1. Place coil mounting post in either half of coil housing.
2. Insert thermostatic coil on mounting post with hook facing clockwise. (See Fig. A.)
3. Assemble second half of housing and secure on mounting post with washer and hair pin. Be sure holes in both housings are in alignment.
4. Install connector rod with hair pin end extending through either hole toward split end of mounting post. Secure with washer and hair pin. (Eye of hair pin extending outward.)
5. Place index disk on mounting post with flat on disk aligning with flat on post and turn disk and post counter-clockwise until hook on coil engages connector rod. Index mark on disk should be just to the right (approximately 2 o'clock position) of connector rod when holding housing with rod pointing to 12 o'clock position. (See Fig. B.) If incorrectly installed turn index disk over.
6. Assemble housing cover to mounting post and install lock washer and nut.
7. Install cover disk on connector rod.

ADJUSTMENT:

1. Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page. Hold in this position with screw driver and tighten lock nut. (See Fig. C.)

   NOTE: Screw driver may be held in vise so that one hand may be used to support housing while tightening nut.
2. After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover. If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without effecting calibration.

TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

ONE PIECE OPEN HOUSING

REASSEMBLY:

1. Place housing with circular edge downward and center web at 3 o'clock position. (See Fig. D.)
2. Insert thermostatic coil into housing with hook on coil in 4 o'clock position and pointing toward web of housing.
3. Insert mounting post through housing and coil with index mark toward hook on coil. (See Fig. E.)
4. Secure mounting post to housing with washer and pin spring.
5. Install cover disk on connector rod.
6. Install connector rod through housing cover into housing toward split end of mounting post. Secure with washer and pin spring. (Eye of pin spring extending outward)
7. Assemble housing cover to mounting post with lock washer and nut. Rotate mounting post counterclockwise until hook on coil picks up connector rod and tighten nut.
8. Check positive spring action by pushing connector rod downward through housing cover.

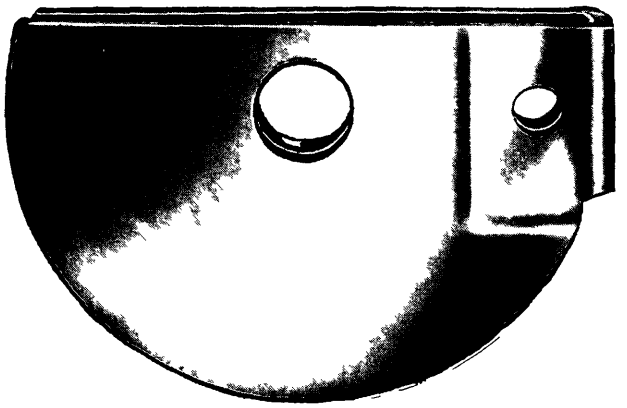

Figure D

ADJUSTMENT:

Same as two piece housing. (See Fig. C.)

CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA

S S PRINTED IN U S A

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. **Lateral Adjustment:** Side of floats should just clear the vertical uprights of float gauge Adjustment should be made by bending arms of floats. **Vertical Adjustment:** With bowl gasket removed, vertical distance between top of float and machined surface of casting must be 5/32 inch (gauge T109-236) for primary floats; and 9/32 inch (gauge T109-284) for secondary floats. Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of floats, the distance between top of floats and bowl cover should be 21/32 inch for primary floats and 25/32 inch for secondary floats. Adjust by bending stop tabs on float bracket.

PUMP ADJUSTMENT: Install pump connector link in center hole (medium stroke) of pump arm, with ends extending outward toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment must be made after pump adjustment. 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020 inch wire gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw. (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is .012 inch (gauge T109-200) opening between throttle valve and bore of carbureter, side opposite idle port. Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

FAST IDLE ON CAR: 1300 to 1350 R.P.M.

UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle adjustment. Crack throttle valves and manually open and close the choke valve Tang on secondary throttle lever should freely engage in notch of lock-out dog. If necessary to adjust, bend tang on secondary throttle lever.

PRIMARY THROTTLE SHAFT DOG ADJUSTMENT:

Block choke valve wide open.

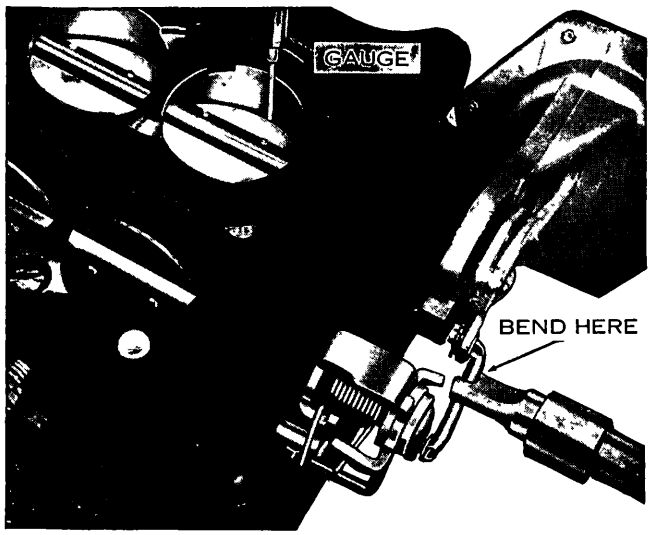

Figure 1

With primary throttle valves in wide open position, adjust (use tool T109-213) secondary operating rod so there is .054" to 064" clearance (gauge T109-193) between upper edge of secondary throttle valves (next to idle port) and bore of carbureter (Fig. 1).

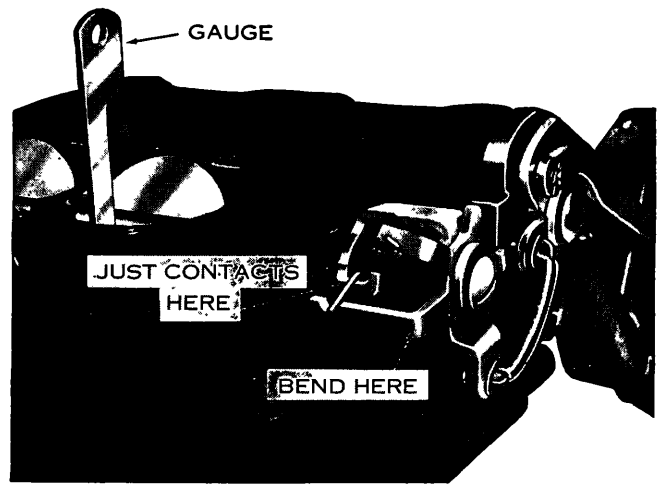

Figure 2

Place 1/4" gauge (tool T109-31) between upper edge of primary throttle valve and bore (next to idle port) and adjust (use tool T109-214) long tang on primary throttle shaft dog so that inner arm of spring just contacts inner lug of secondary operating lever and secondary throttle valves just start to open (Fig. 2).

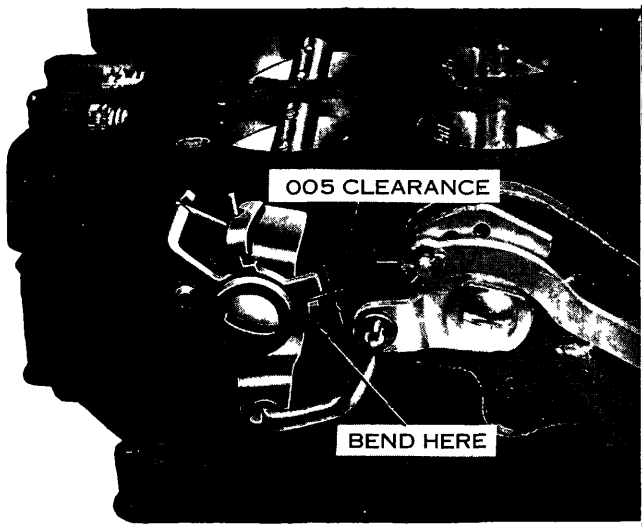

Figure 3

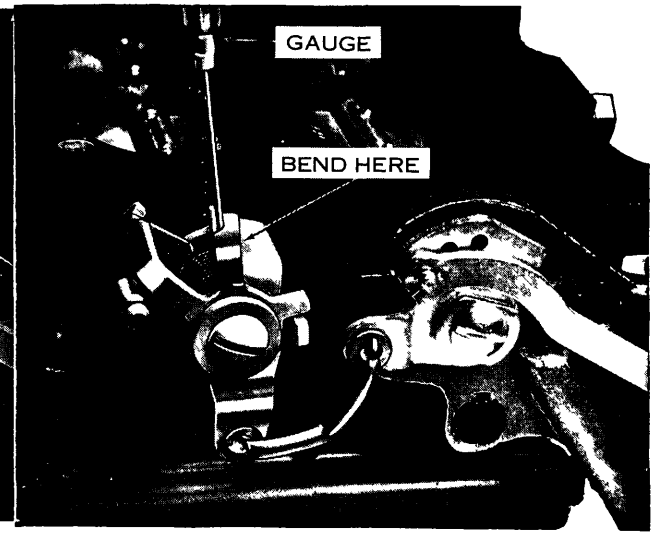
With primary and secondary throttle valves tightly seated there should be 005" clearance (gauge T109 237) between outer lip on secondary operating lever and stop lug on primary throttle shaft dog

TO ADJUST Bend outer lip on secondary operating lever (use tool T109 214)

CAUTION After bending be sure secondary operating lever operates freely and does not bind in any position (Fig 3)



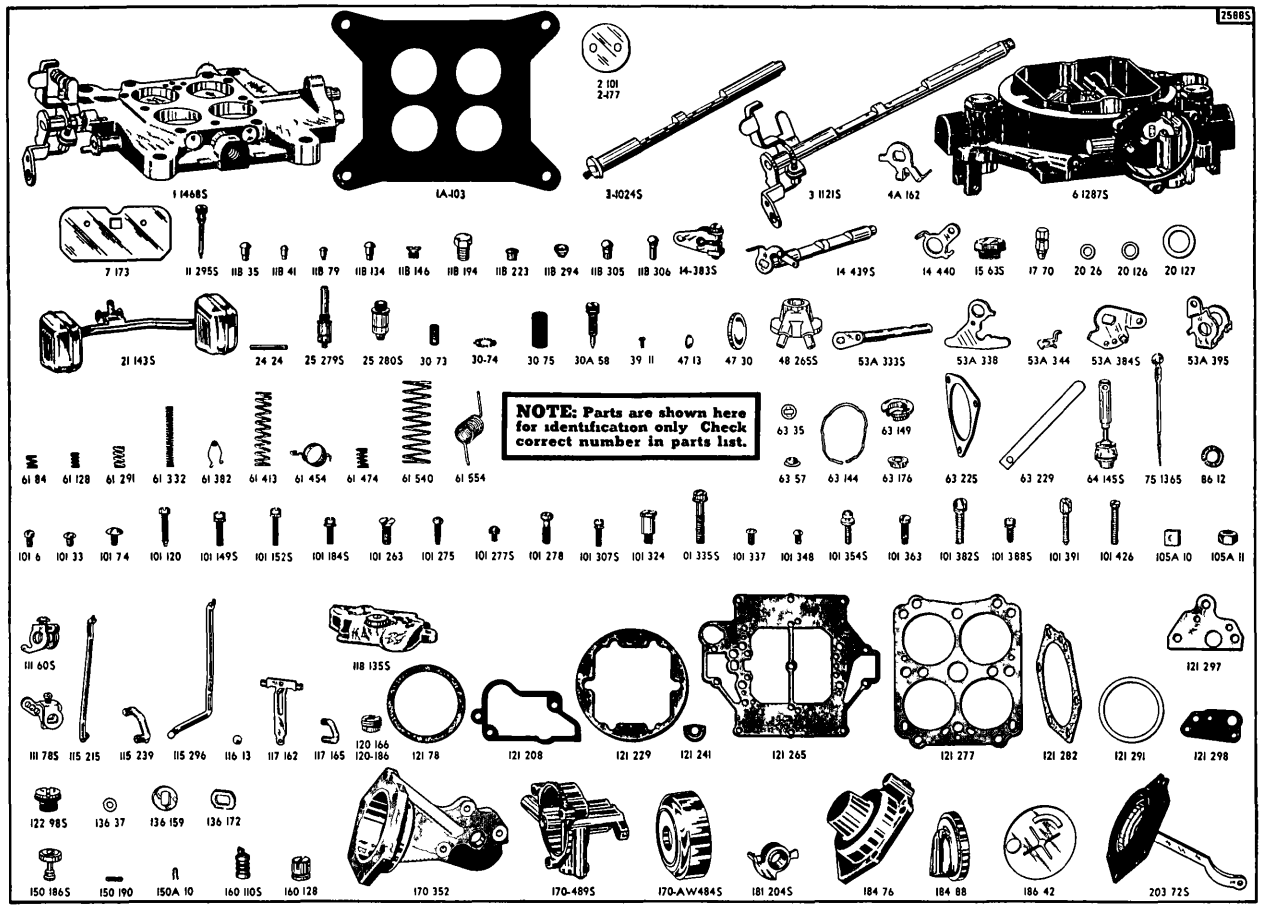


Figure 4

With primary and secondary throttle valves tightly closed there should be 040" clearance (gauge T109 193) between short tang on primary throttle shaft dog and outer arm of spring

TO ADJUST Bend short tang on primary throttle shaft dog (use tool T109 214) (Fig 4)

DE SOTO "V-8"

MODEL S-25

1957

(All Transmissions)

BBD Dual Down-Draft Climatic® Control Carbureters Nos. 2522S-2522SA-2522SB

CARBURETER SPECIFICATIONS

For DeSoto 8 Cylinder Engine· 3.78 Inch Bore, 3.80 Inch Stroke

Dimensions Flange size, 1¼ inch dual, 4 bolt type Throttle bore, 1 7/16 inch I D Primary venturi ⅜ inch I D Main venturi, 1-3/16 inch I D.

Vent: Inside, balance vent tube to bowl, in air horn above choke valve Outside (late prod) (2) No 36 (1065 inch) in flange above throttle valve

Gasoline Intake. Size No 38 (1015 inch) drill hole in needle seat

Idle Tube· Jet in venturi assembly size 0275 inch diameter Idle bleed (in venturi cluster screw), size 055 inch diameter Idle restriction (in venturi cluster screw), size 055 inch diameter Venturi idle bleed in body size 0472 inch diameter Models S and SA have idle passage through top of venturi cluster, models SB have diagonal passage to screw hole

Idle Port Upper slot type length, 189 inch, width 030 inch

Idle Port Opening 148 to 152 inch above upper edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size 053 to 057 inch diameter

Set Idle Adjustment Screw ½ to 1½ turns open For richer mixture turn screw out With gear shift lever in neutral position idle engine at 500 R P M

Main Nozzle: Nozzle is installed permanently DO NOT REMOVE

Main Vent Tube: Side holes 10—size 0433 inch 1—size 0393 inch diameter Main vent in bottom of tube size 0393 inch diameter

Step-Up Rod: (Vacuum operated) 023 inch diameter.

Metering Jet: Calibrated to flow 327 to 333 cc per minute (Do not gauge for size, if in doubt, replace with new part)

Accelerating Pump: Pump discharge jets (2—in venturi cluster) size 0275 inch diameter Intake ball check seat, size 130 to 140 inch diameter Discharge ball check seat, size 110 to 120 inch diameter

Choke: Carter Climatic® Control, set 1 point rich Butterfly type, offset valve Choke heat suction hole in body, size 063 inch diameter NOTE Thermostatic coil should not be removed from delayer mounting post If defective, replace with complete thermostatic coil and housing assembly

Vacuum Spark Port Horizontal round end type, (early prod) 030 by 110, (late prod) 045 by 110 inch Top of port to be (early prod) 035 to 045 inch (late prod) 025 to 035 inch above upper edge of valve with valve closed tight

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open 6° B. T. C. At Vibration Damper	Float Setting 9/32 Inch (Use Gauge T109-239)	Idle Adjustment Screw Setting ½ to 1½ Turns Open Idle Engine at 500 R.P.M.

NOTE. These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

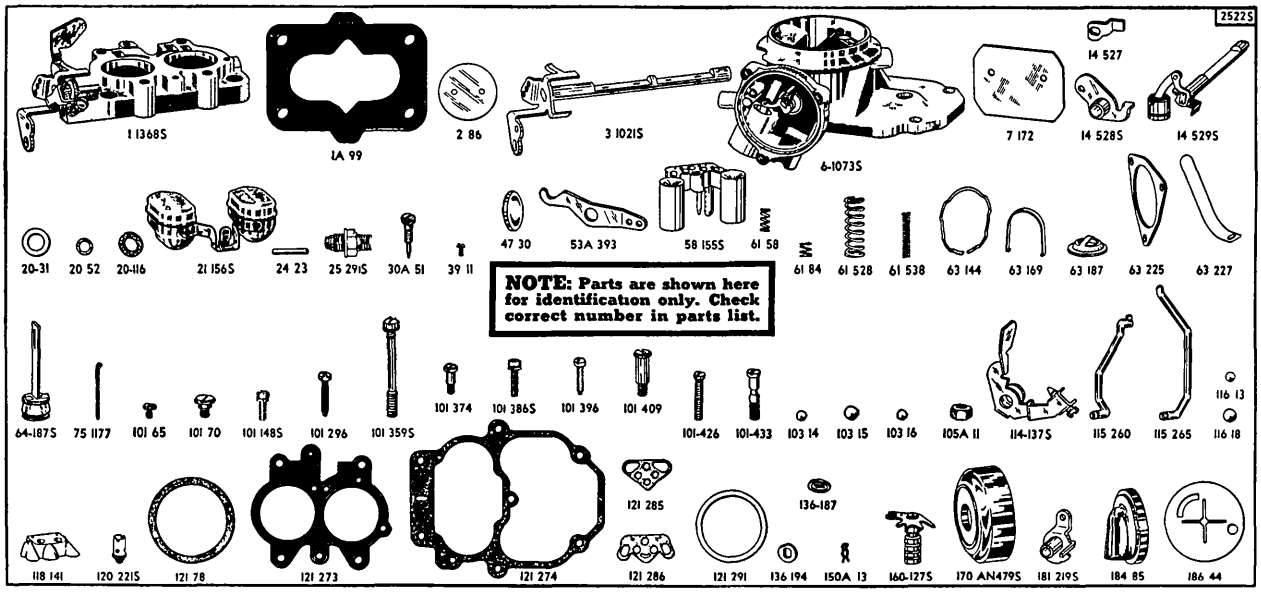
Adjustments Illustrated on Service Adjustment Procedure Form 3658

Float Level. 9/32" (gauge T109-239) between top of each float ridge (at center of float) and top surface of body casting To adjust bend lip on float arm

Pump: 1 1/32" from the top of the bowl cover to the top of the plunger shaft Install throttle connector rod in center hole (medium stroke) of throttle lever and inner hole of pump arm To adjust bend throttle connector rod

Fast Idle Cam Clearance· With choke valve closed and lip on inner choke shaft lever contacting lug on outer lever align index mark on cam with adjusting screw To adjust bend lip on inner choke shaft lever

Fast Idle on Car· 1300 to 1350 hot engine with fast idle screw on high step of cam



Fast Idle Throttle Valve Clearance: 020" (gauge T109 29) between lower edge of valve and bore with adjusting screw on index mark of cam

Unloader. ¼" (gauge T109-31) between top edge of choke valve and inner wall of air horn with throttle valves wide open To adjust bend unloader arm on throttle lever

DE SOTO "V-8"

MODEL S-24
"ADVENTURER"
1956

(2445S)
Rear Carbureter

(2476S)
Front Carbureter

WCFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2445S-2476S**

CARBURETER SPECIFICATIONS

For DeSoto 8 Cylinder Engine: 3.78 Inch Bore, 3.80 Inch Stroke

Dimensions: Flange size, 1 1/8 inch Four Bore—4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi size, 1-1/16 inch I. D.

Vents: Inside (5), outside (none).

Gasoline Intake: Size No. 42 (.0935 inch) drill; in needle seat.

Low Speed Jet Tube: Jet, primary and secondary, size No. 69 (.0293 inch) drill. By-pass, in body size primary No. 52 (.0635 inch) drill, secondary (.057 inch) diameter. Economizer, in body size (.0452 inch) diameter. Idle bleed, in body size primary (.059 inch) diameter, secondary No. 44 (.086 inch) drill.

Idle Port: Upper, slot type, primary, length .175 inch; width .030 inch. Secondary, length .103 inch; width .030 inch.

Idle Port Opening: Primary .116 to .122 inch, secondary .059 to .065 inch above top edge of valve with valve tightly closed.

Lower Port: Primary (for idle adjustment screw), size No. 55 (.052 inch) drill. Secondary (no idle adjustment screw), size No. 57 (.043 inch) drill.

Set Idle Adjustment Screw: 1/4 to 1 1/4 turns open. For richer mixture turn screw out. Do not idle engine below 650 to 750 R.P.M. in neutral.

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating jet (4) size No. 70 (.028 inch) drill.

Metering Rod: (Vacumeter type) see parts list for size.

Metering Rod Jet: Primary: size (2445S) .0935 inch, (2476S) .089 inch diameter. Secondary: Size .055 inch diameter.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 74 (.0225 inch) drill. Intake ball check seat, size .115 to .120 inch diameter. Discharge needle seat, size No 50 (.070 inch) drill. Relief passage (vent) to fuel chamber, size No. 42 (.0935 inch) drill.

Choke: Carter Climatic® Control, set on index. Butterfly type offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 43 (.089 inch) drill.

Vacuum Spark Port: Horizontal slot (round end) .045 x .110 inch. Top of port .035 to .045 inch above top edge of valv with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open: 6° B. T. C. At Vibration Damper	Float Setting Primary 7/32 Inch (Use Gauge T109-283) Secondary 11/32 Inch (Use Gauge T109-285)	Idle Adjustment Screw Setting 1/4 t 1 1/4 Idle Engine at 650 to 750 R.P.M. In Neutral

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. **VERTICAL ADJUSTMENT:** With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 7/32 inch (gauge T109-283) for primary floats; and 11/32 inch (gauge T109-285) for secondary floats. Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of floats, the distance between top of floats and bowl cover should be 23/32 inch for primary floats and 27/32 inch for secondary floats. Adjust by bending stop tabs on float bracket.

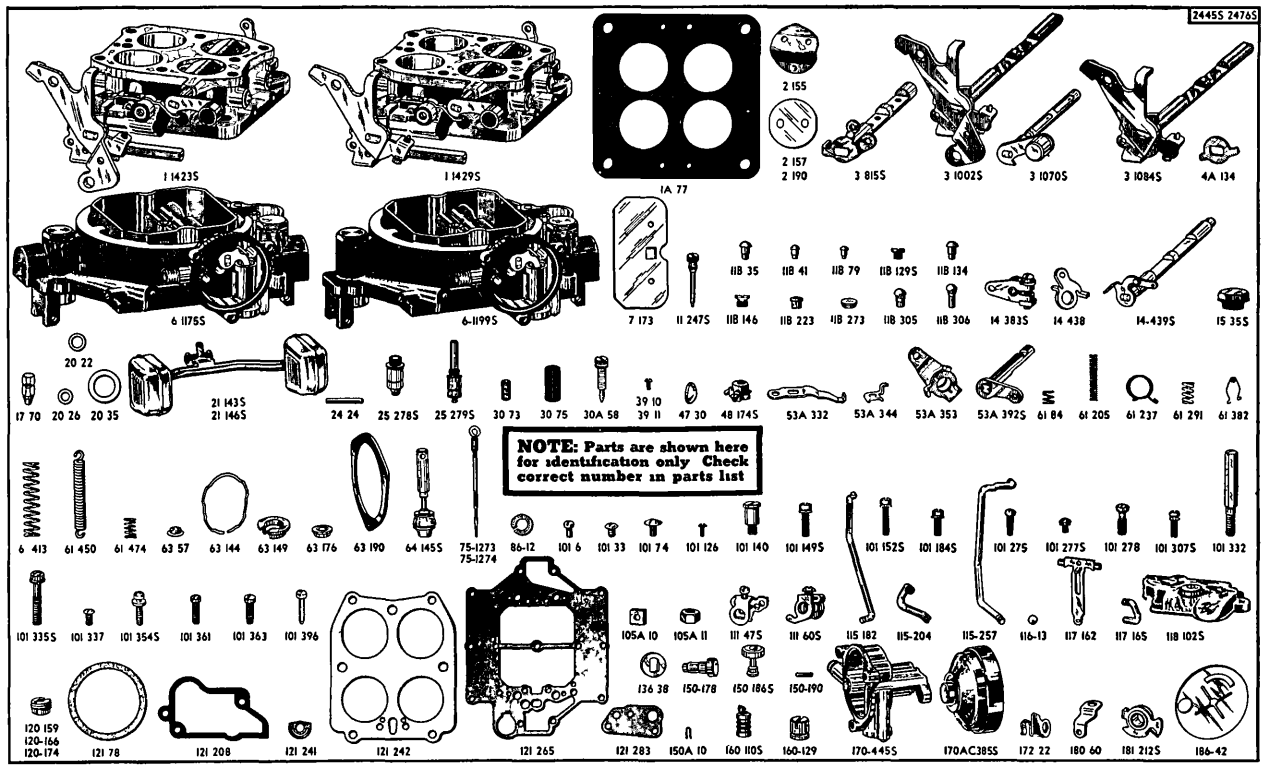
PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at upper angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .015 inch feeler gauge (T109-44) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing lever towards closed position — hold in place and tighten clamp screw. (b) With choke valve tightly closed, tighten fast idle adjustment screw until there is .006-.010 inch (gauge T109-200) opening between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

FAST IDLE ON CAR: 1350 to 1400 R.P.M.



UNLOADER ADJUSTMENT: With throttle wide open there should be 11/64 inch clearance between upper edge of choke valve and inner wall of air horn (gauge T109-166). Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

AUXILIARY THROTTLE VALVE ADJUSTMENT: (a) Disconnect secondary throttle operating rod. (b) Adjust stop lug on secondary throttle lever (use bending tool T109-214) until there is 27/64 inch clearance (gauge T109-242) between lower edge of auxiliary throttle valve and bore, when lug is against stop on flange.

SECONDARY THROTTLE LEVER ADJUSTMENT: The stop lug on both primary and secondary throttle levers should contact boss on flange at the same time. To adjust bend secondary throttle operating rod at angle (use bending tool T109-213).

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle adjustment. 1. With choke valve closed, edge of hook on lock-out arm should contact auxiliary throttle lever, making maximum contact of locking step on lever. 2. Open choke valve. Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position. Adjust by bending lock-out arm.

WCFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2311S-2311SA**

CARBURETER SPECIFICATIONS

For De Soto 8 Cylinder Engine: 3.72 Inch Bore, 3.80 Inch Stroke

Dimensions. Flange size 1¼ inch Four Bore—4 bolt type
Primary venturi size 11/32 inch I D
Main venturi size, 1-3/16 inch I D

Vents: Outside (4) Inside, (5)

Gasoline Intake. Size No 42 (.0935 inch) drill hole in needle seat

Low Speed Jet Tube: Jet, (4) size 035 inch diameter
By pass in body, (4) size No. 52 (.0635 inch) drill
Economizer (4) size 0452 inch diameter
Idle bleed, (4) in body size No 52 (.0635 inch) drill

Idle Port: Upper slot type Primary length 175 inch, width 030 inch Secondary length 101 inch, width 030 inch

Idle Port Opening: Primary, 130 to 134 inch above top edge of valve with valve tightly closed Secondary 071 to 077 inch

Lower Port Primary (for idle adjustment screw) size No 53 (.0595 inch) drill Secondary, constant feed, size 040 inch diameter

Set Idle Adjustment Screw: 1 to 2 turns open For richer mixture turn screw out Do not idle engine below 500 R P.M in neutral.

Main Nozzle: Installed permanently DO NOT REMOVE Anti percolating jet (to nozzle well), primary side, (to idle well) secondary side size No 70 (.028 inch) drill

Metering Rod. Primary economy step 075 inch diameter Middle step tapers to 065 inch diameter Power step 042 inch diameter Secondary, none

Metering Rod Jet: Primary size 096 inch diameter (for metering rod)
Secondary size 0595 inch diameter (no metering rod)

Accelerating Pump: Discharge jet (twin) primary side only size No 74 (.0225 inch) drill
Intake ball check seat size 115 to 120 inch diameter
Discharge needle seat, size 070 inch diameter
Relief passage (vent) to fuel chamber No 42 (.0935 inch) drill
Discharge relief plug size No 55 (.052 inch) drill

Choke: Carter Climatic® Control set one point rich Butterfly type, offset choke valve primary side only Choke heat suction hole restriction in piston housing, size No 47 (.0785 inch) drill

Vacuum Spark Port: Horizontal slot (round end) 045 by 110 inch Top of port 032 to 042 inch above valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION. Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open 4° B. T. C. At Vibration Damper	Float Setting Primary 5/32 Inch (Use Gauge T109-236) Secondary 7/32 Inch (Use Gauge T109-283)	Idle Adjustment Screw Setting 1 to 2 Turns Open Idle Engine at 500 R.P.M. In Neutral

NOTE These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. **Lateral Adjustment:** Side of floats should just clear the vertical uprights of float gauge Adjustment should be made by bending arms of floats **Vertical Adjustment:** With bowl gasket removed, vertical distance between top of float and machined surface of casting must be 5/32 inch (gauge T109-236) for primary floats, and 7/32 inch (gauge T109-283) for secondary floats Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of floats, the distance between top of floats and bowl cover should be 21/32 inch for primary floats and 23/32 inch for secondary floats Adjust by bending stop tabs on float bracket.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending outward toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment must be made after pump adjustment. 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments Install dust cover and dust cover gasket Back out throttle lever seat screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover To adjust, remove dust cover and bend vapor vent arm

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert 020 inch wire gauge (T109-29) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is 012 inch (gauge T109-200) opening between throttle valve and bore of carbureter side opposite idle port Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle adjustment Crack throttle valves and hold choke valve tightly closed Then close throttle. Tang on secondary throttle lever should freely engage in notch of lock-out dog If necessary to adjust, bend tang on secondary throttle lever

PRIMARY THROTTLE SHAFT DOG ADJUSTMENT:

Block choke valv wide open.

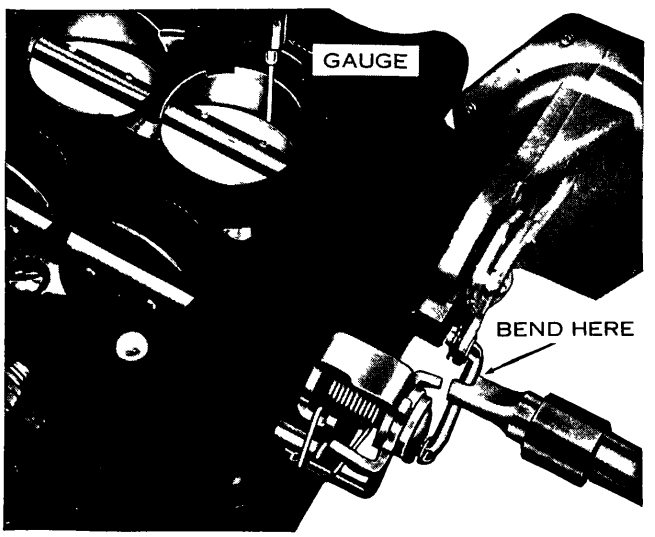

Figure 1

With primary throttle valves in wide open position, adjust (use tool T109-213) secondary operating rod so there is .054" to .064" clearance (gauge T109-193) between upper edge of secondary throttle valve (next to idle port) and bore of carbureter (Fig. 1).

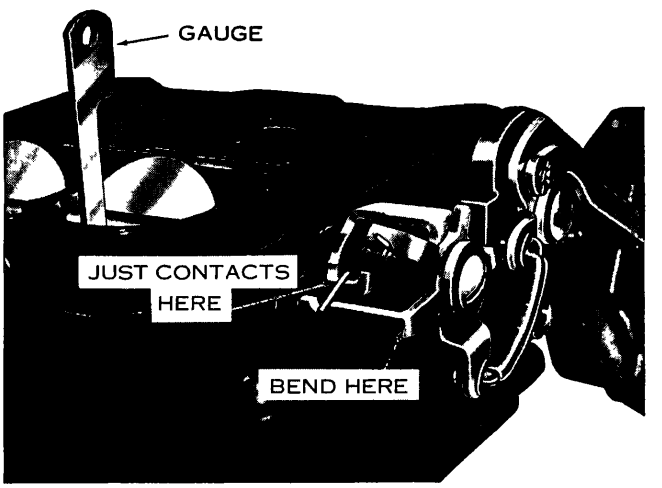

Figure 2

Place 1/4" gauge (tool T109-31) between upper edge of primary throttle valve and bore (next to idle port) and adjust (use tool T109-214) long tang on primary throttle shaft dog so that inner arm of spring just contacts inner lug of secondary operating lever and secondary throttle valves just start to open (Fig. 2).

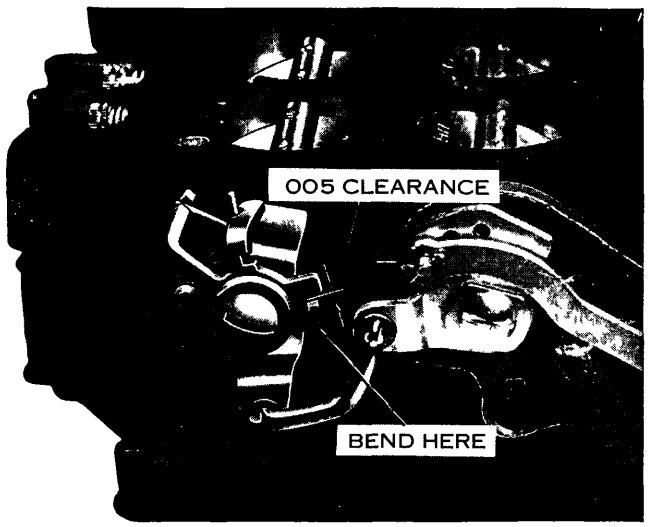

Figure 3

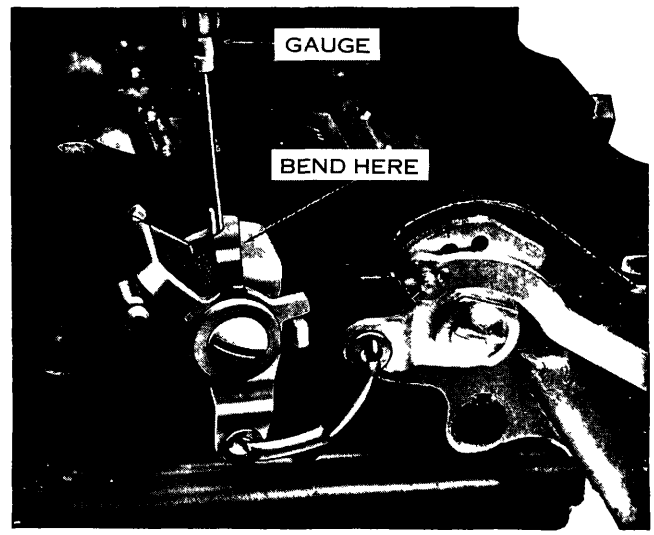
With primary and secondary throttle valves tightly seated there should be 005" clearance (gauge T109 237) between outer lip on secondary operating lever and stop lug on primary throttle shaft dog

TO ADJUST Bend outer lip on secondary operating lever (use tool T109 214)

CAUTION After bending be sure secondary operating lever operates freely and does not bind in any position (Fig 3)



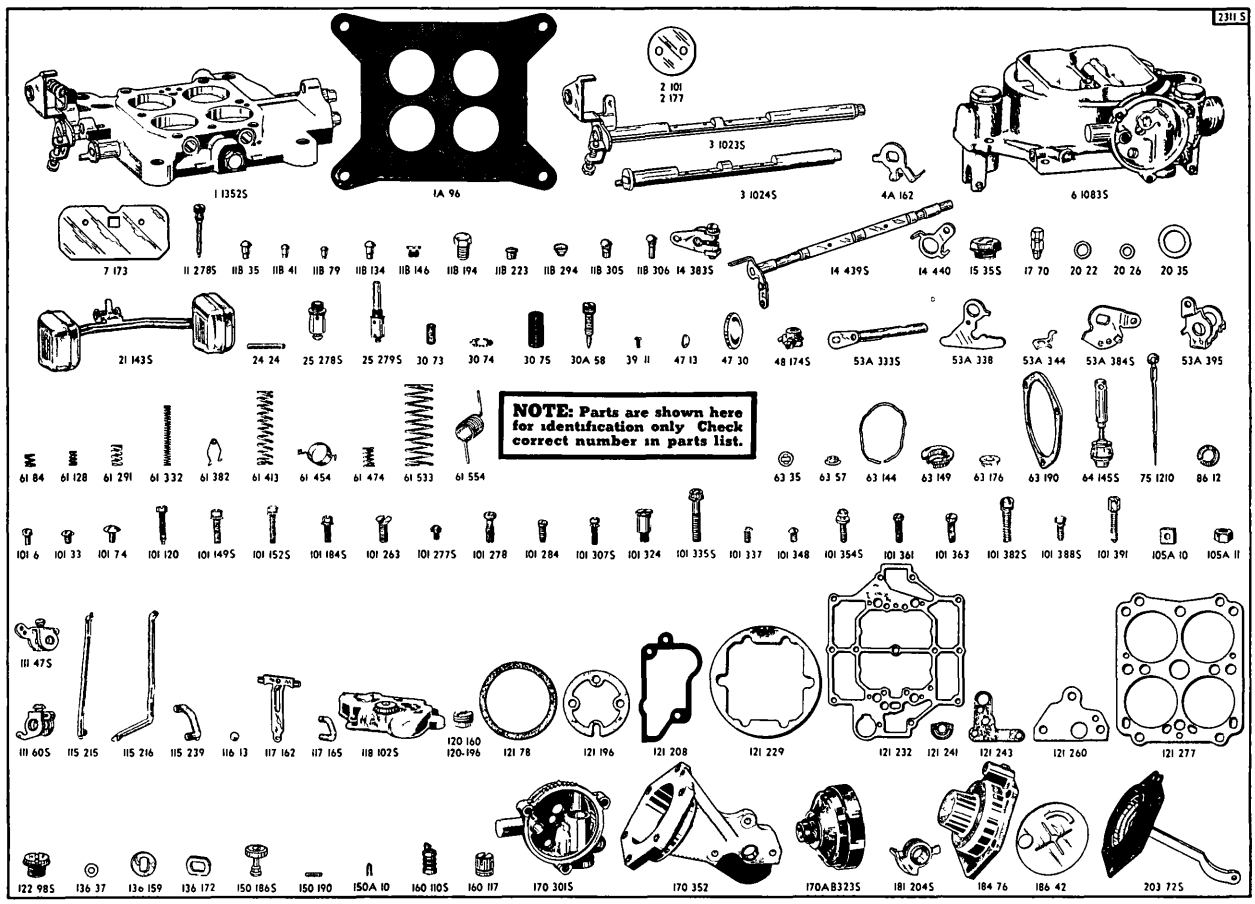


Figure 4

With primary and secondary throttle valves tightly closed there should be 040" clearance (gauge T109 193) between short tang on primary throttle shaft dog and outer arm of spring

TO ADJUST Bend short tang on primary throttle shaft dog (use tool T109 214) (Fig 4)

De Soto "V-8"—1956—Carbureters Nos. 2311S-2311SA

BBD Dual Down-Draft Climatic® Control **Carbureters Nos. 2308S-2309S-2310S**

CARBURETER SPECIFICATIONS

For DeSoto 8 Cylinder Engine: 3.72 Inch Bore, 3.80 Inch Stroke

Dimensions: Flange size, 1¼ inch dual, 4 bolt type. Throttle bore, 1-7/16 inch I. D. Primary venturi, ⅜ inch I. D. Main venturi, 1-3/16 inch I. D.

Float Level: See adjustments.

Vent: Inside, balance vent tube to bowl, in air horn above choke valve.

Gasoline Intake: Size No. 38 (.1015 inch) drill hole in needle seat.

Idle Tube: Jet, size .035 inch diameter. Idle bleed (in venturi cluster screw), size .063 inch diameter. Idle restriction (in venturi cluster screw), size .0472 inch diameter.

Idle Port: Upper, slot type, length .189 inch; width, .030 inch.

Idle Port Opening: .148 to .152 inch above upper edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size .053 to .057 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. With gear shift lever in neutral position, idle engine between 450 and 500 RPM.

Main Nozzle: Nozzle is installed permanently. DO NOT REMOVE.

Main Vent Tube: Side holes 8—size .0354 inch diameter. Main vent in top of tube, size .0196 inch diameter.

Step-Up Rod: (Vacuum operated) .023 inch diameter.

Metering Jet: Calibrated to flow 327 to 333 cc per minute. (Do not gauge for size, if in doubt, replace with new part.)

Accelerating Pump: Pump discharge jets (2—in venturi cluster), size .0295 inch drill. Intake ball check seat, size .135 to .140 inch diameter. Discharge ball check seat, size .110 to .120 inch diameter.

Pump Adjustments: See adjustments.

Choke: Carter Climatic® Control, set (2308S-2309S) on index, (2310S) one point rich. Butterfly type, offset valve. Choke heat suction hole, in body, size No. 54 (.055 inch) drill. NOTE: Thermostatic coil should not be removed from delayer mounting post. If defective, replace with complete thermostatic coil and housing assembly.

Vacuum Spark Port: Horizontal, round end type, .030 by .110 inch. Top of port to be .035 to .045 inch above upper edge of valve with valve closed tight.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open: 8° B. T. C. At Vibration Damper	Float Setting See Adjustments	Idle Adjustment Screw Setting ½ to 1½ Turns Open Idle Engine at 450 to 500 R.P.M.

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3658

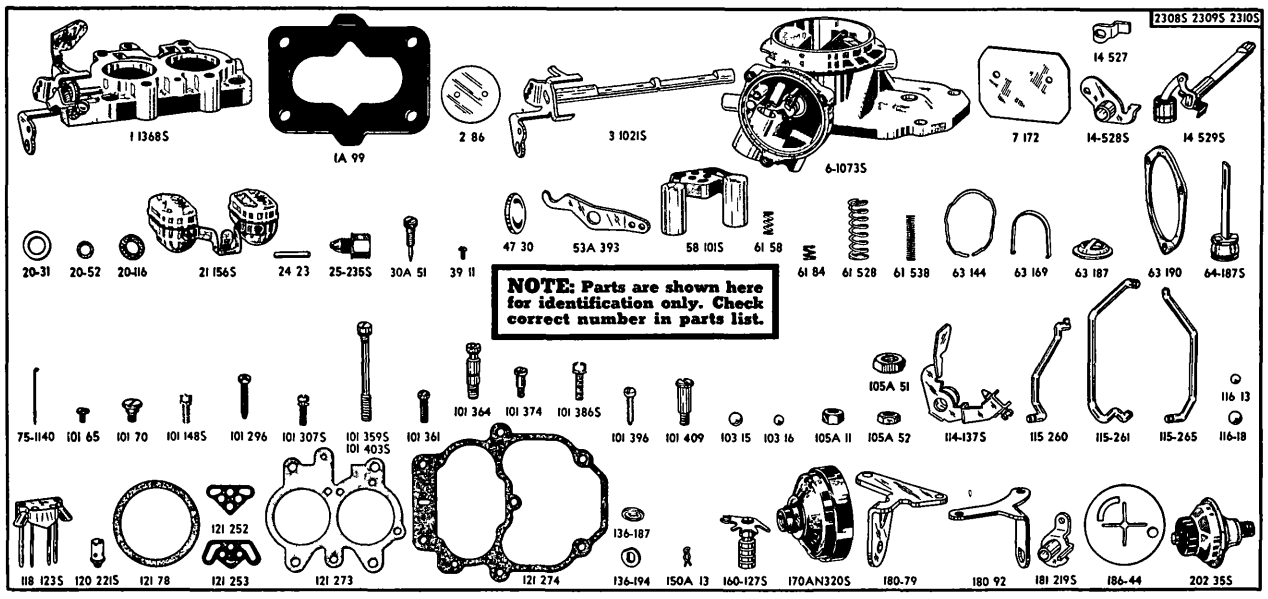
Float Level: ¼" (Gauge T109-282) between top of each float and top surface of body casting.
To adjust: bend lip on float arm.

Pump: 1-1/32" from the top of the bowl cover to the top of the plunger shaft. Install throttle connector rod in center hole (medium stroke) of throttle lever and inner hole of pump arm.
To adjust: bend throttle connector rod.

Fast Idle Cam Clearance: With choke valve closed and lip on inner choke shaft lever contacting lug on outer lever there should be .020" (Gauge T109-29) between lip of fast idle cam and boss on casting. Optional adjustment, (late production), align index mark on cam with adjusting screw.
To adjust: bend lip on inner choke shaft lever.

Fast Idle Throttle Valve Clearance: .015" (Gauge T109-44) between lower edge of valve and bore with adjusting screw on high step of cam.

Unloader: 3/16" (Gauge T109-28) between top edge of choke valve and inner wall of air horn with throttle valves wide open.
To adjust: bend unloader arm on throttle lever.



Dash Pot (Slow Closing Throttle): Close throttle valves and bottom plunger shaft with 1/16" gauge between shaft and operating lever.
To adjust: loosen lock nut and turn dash pot unit in or out.

Overdrive Kickdown Switch: With throttle valves wide open there should be 1/64" to 3/64" between kickdown lever and switch stem guide.
To adjust: loosen locknuts and adjust switch.

CARTER CARBURETOR
DIVISION OF acf INDUSTRIES INCORPORATED
ST. LOUIS, MO., U. S. A.

CARTER MODEL BBD CARBURETER FOR DESOTO
(SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor Corporation, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the brass identification tag, when requesting specification pages.

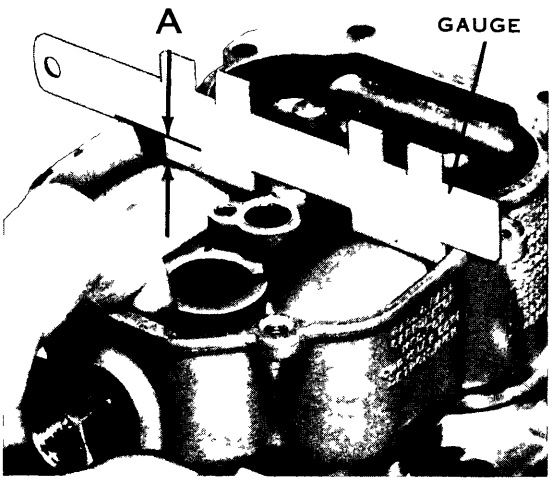

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

This adjustment must be made with the bowl cover gasket and float pin retainer removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots. The distance (A) from the top surface of the body casting to the top of each float should be as listed on carbureter specification page. If one float is lower than the other, equalize by bending the float arm. If both floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywhere against the inner walls of the bowl. If necessary, bend float arms slightly to provide clearance on all sides of floats.

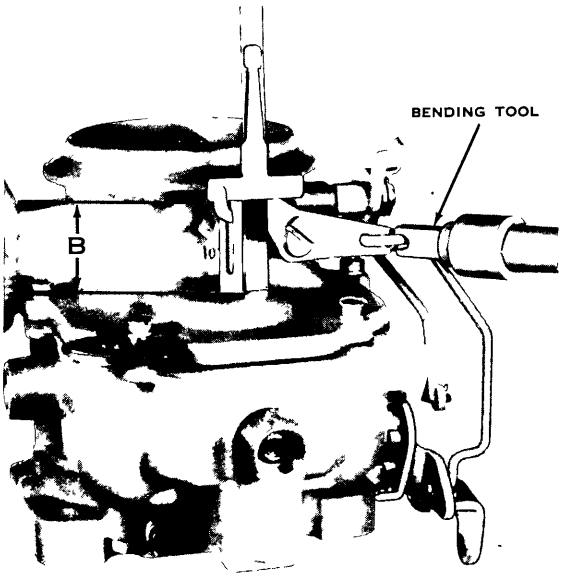

Figure 2
Pump Adjustment

PUMP ADJUSTMENT (Fig. 2):

1. Back out throttle adjustment screw and open choke valve so that throttle valves seat in bores of carbureter.
2. Install throttle connector rod in the holes in the throttle lever and pump arm specified on carbureter specification page.
3. Th distance (B) from the top of the bowl cover to th top of the plunger shaft should be as specified on carbureter specification page.
4. Adjust by bending pump connector rod. (Use bending tool T109-213.)

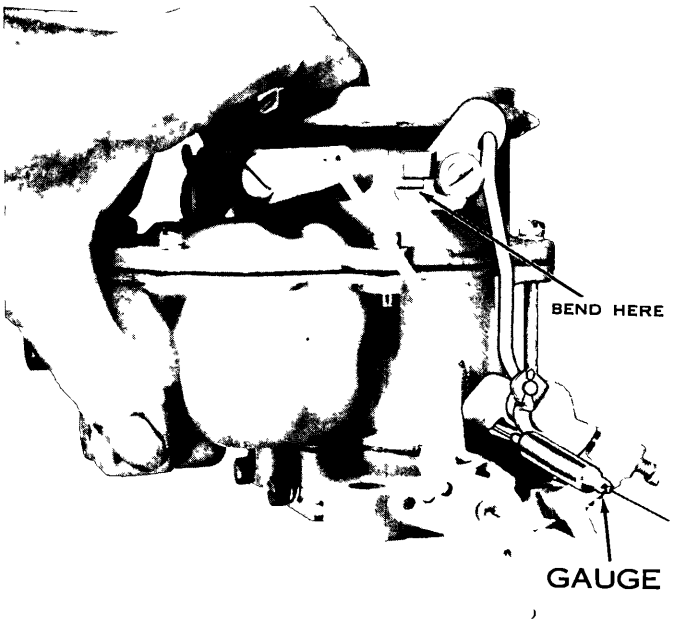

Figure 3
Fast Idle Adjustment

FAST IDLE CAM CLEARANCE ADJUSTMENT (Fig. 3):

1. Hold choke valve tightly closed.
2. With lip on inner choke shaft lever contacting lug on outer lever, there should be the clearance listed on carbureter specification page between lip of fast idle cam and boss on casting. Optional adjustment (late production), align index mark on cam with adjusting scr w.
3. Adjust by bending lip on inner choke shaft lever. (Use bending tool T109-22.)

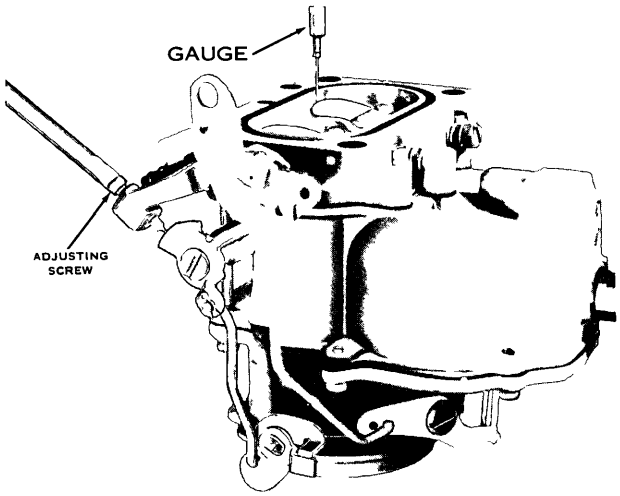

Figure 4
Fast Idle Adjustment

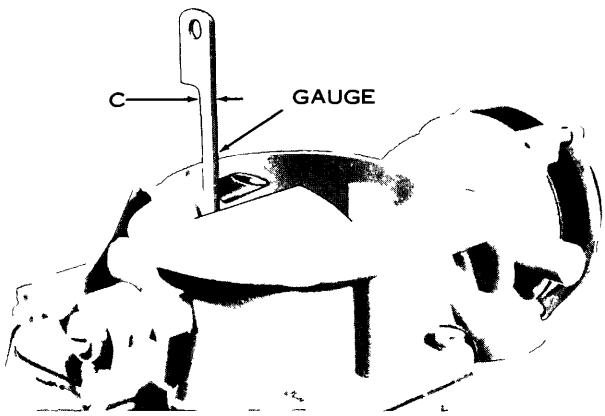

Figure 5
Unloader Adjustment

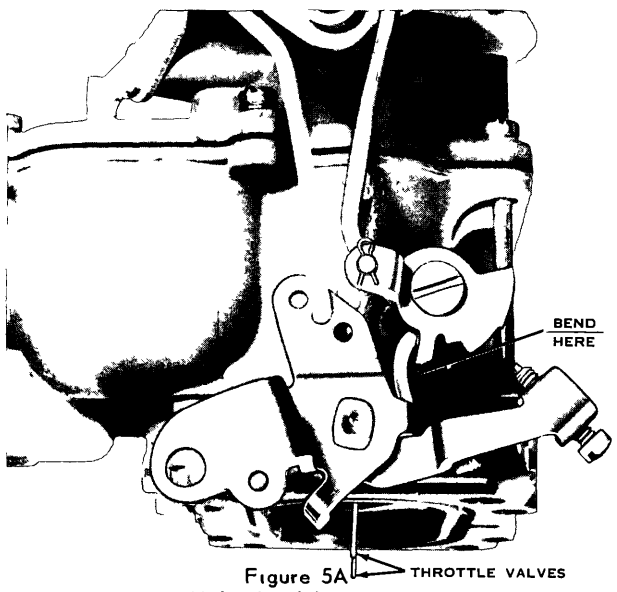

Figure 5A
Unloader Adjustment

UNLOADER ADJUSTMENT (Figs. 5 & 5A):

1. Hold throttle valves wide open.
2. Clos choke valve as far as possible without forcing.
3. Clearance (C) betw n top dg of choke valve and inner wall of air horn (Fig. 5) should be as listed on carbureter specification page.
4. Adjust by bending choke unloader arm on throttle lever (Fig. 5A). (Use bending tool T109-213.)

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 4):

1. Be sure choke valv is closed.
2. Adjust fast idle adjusting screw against high step of cam until the clearance between throttle valve (side opposite port) and bore is as listed on carbureter specification page.

Figure 6
Dashpot Adjustment

DASH POT (SLOW CLOSING THROTTLE) ADJUSTMENT (Fig. 6):

The purpose of this unit is to prevent the car from stalling when the throttle is released rapidly. Maximum action is obtained by loosening lock nut and adjusting the dash pot unit so that the plunger shaft can be bottomed with a 1/16 inch gauge (D) placed between shaft and operating lever with throttle valves tightly closed.

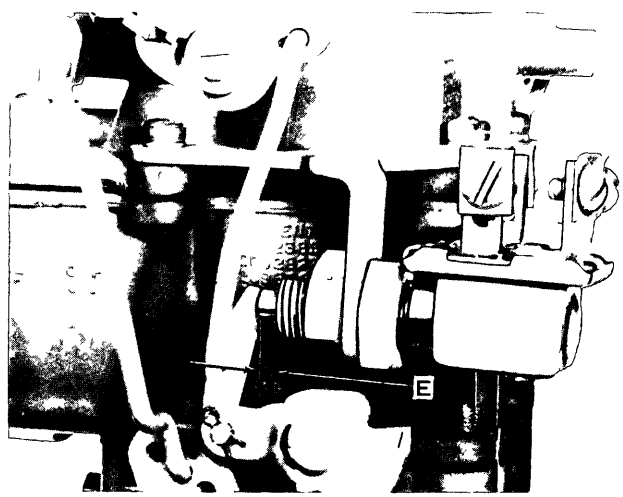

Figure 7
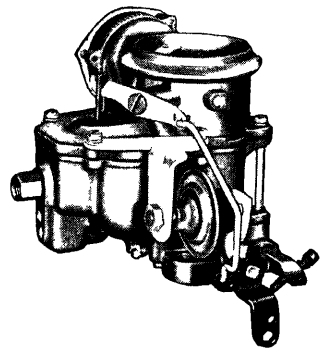
Overdrive Kickdown Switch Adjustment



OVERDRIVE KICKDOWN SWITCH ADJUSTMENT (Fig. 7):

With throttle valves in wide open position, adjust hex nuts on switch to have 1/64 inch to 3/64 inch clearance (E) between kickdown lever and switch stem guide.

BBD Dual Down-Draft Climatic® Control Carbureters
Nos. 2176S-2176SA-2177S-2177SA-2178S-2178SA

CARBURETER SPECIFICATIONS

For DeSoto 8 Cylinder Engine 3 720 Inch Bore 3 344 Inch Stroke

Dimensions Flange size 1¼ inch dual 4 bolt type
Throttle bore 1 7/16 inch I D
Primary venturi ⅜ inch I D
Ma n venturi 1 3/16 inch I D

Float Level See adjustments

Vent Inside balance vent tube to bowl in air horn above choke valve

Gasoline Intake Size No 38 (1015 inch) drill hole in needle seat

Idle Tube Jet size 0334 inch drill
Idle bleed (in venturi cluster screw) size 063 inch drill
Idle restriction (in venturi cluster screw) size 0472 inch drill

Idle Port Upper slot type length 149 inch width 030 inch

Idle Port Opening 102 to 106 inch above upper edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw) Size 053 to 057 inch diameter

Set Idle Adjustment Screw ¼ to 1¼ turns open For richer mixture turn screw out With gear shift lever in neutral position idle engine between 475 and 500 RPM

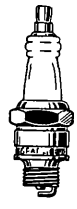
Main Nozzle Nozzle is nstalled permanently DO NOT RE MOVE

Main Vent Tube Side holes 6—bottom three holes (from closed end) size 0354 inch next two holes 0236 inch top hole 0197 inch d ameter
Main vent in top of tube size 0275 inch diameter

Step Up Rod (Vacuum operated) 024 inch diameter

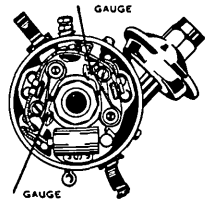
Metering Jet Calibrated to flow 356 to 364 cc per minute (Do not gauge for size if in doubt replace with new part)

Accelerating Pump Pump discharge jets (2—in venturi cluster) size 0275 inch drill
Intake ball check seat size 135 to 140 inch diameter
D scharge ball check seat s ze 110 to 120 inch diameter



Pump Adjustment See adjustments

Choke Carter Climatic® Control set at index Butterfly type offset valve Choke heat suction hole in body size No 38 (1015 inch) drill
NOTE Thermostatic coil should not be removed from delayer mounting post If defective replace with complete thermo static coil and housing assembly



Vacuum Spark Port Horizontal round end type 030 by 110 inch Top of port to be 035 to 045 inch above upper edge of valve with valve closed tight

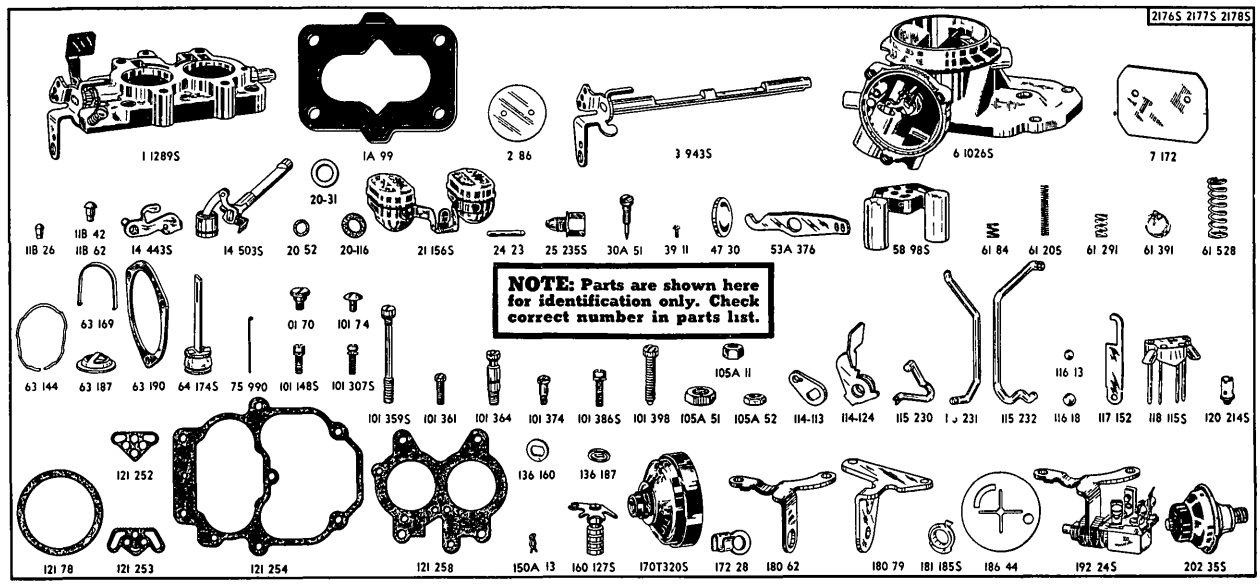
CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: This adjustment must be made with the bowl cover gasket and float pin retainer removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots. The distance from the top surface of the body casting to the top of each float should be 7/32 inch (gauge T109-239). If one float is lower than the other, equalize by bending the float arm. If both floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywhere against the inner walls of the bowl. If necessary, bend float arms slightly to provide clearance on all sides of floats.

PUMP ADJUSTMENT: Back out throttle adjustment screw and open choke valve so that throttle valves seat in bores of carbureter. Install throttle connector rod in outer hole (medium stroke) of throttle lever and inner hole of pump arm. The distance from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 1 inch. Adjust by bending pump connector rod (2176S-SA-2177S-SA) at lower angle; (2178S-SA) at upper angle (use tool T109-213).

FAST IDLE ADJUSTMENT: Remove thermostatic coil housing assembly, gasket and baffle plate. With throttle adjusting screw backed out, crack throttle valve and hold choke valve in fully closed position. Then close throttle. This will allow fast idle cam to revolve to fast idle position. There should now be .015"-.019" clearance (use gauge T109-44) between throttle valve and bore of carbureter (side opposite idle port). Adjust by bending the choke connector rod at lower angle (use tool T109-213).



UNLOADER ADJUSTMENT: This adjustment must be made after the fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing. There should now be 1/4 inch clearance (use gauge T109-31) between upper edge of choke valve and inner wall of air horn. Adjust by bending arm on choke trip lever (use tool T109-214). When fast idle and unloader adjustments have been made, assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn. Set Climatic® Control at "Index", making sure that hook on coil has picked up coil shaft lever.

DASH POT (SLOW CLOSING THROTTLE) ADJUSTMENT: The purpose of this unit is to prevent the car from stalling when the throttle is released rapidly. Maximum action is obtained by loosening lock nut and adjusting the dash pot unit so that the plunger shaft can be bottomed with a 1/16 inch gauge placed between shaft and operating lever with throttle valves tightly closed. Then tighten lock nut.

OVERDRIVE KICKDOWN SWITCH ADJUSTMENT: With throttle valves in wide open position adjust hex nuts on switch to have 1/64 inch to 3/64 inch clearance between kickdown lever and switch stem guide.

NOTE: If necessary bend kickdown lever to contact switch stem.

DE SOTO FIREFLITE "V-8" MODEL S-21 1955

WCFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2210S**

CARBURETER SPECIFICATIONS

For DeSoto 8 Cylinder Engine: 3.720 Inch Bore, 3.344 Inch Stroke

Dimensions: Flange size, 1 1/8 inch Four Bore—4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi, size, 1-1/16 inch.

Float Level: See adjustments.

Vents: Outside, 2 on primary side, 2 on secondary side. **Inside,** 2 on primary side, 3 on secondary side.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: Jet, size No. 69 (.02925 inch) drill.
By Pass, in body, size (.057 inch) drill.
Economizer, size (.0452 inch) drill.
Idle bleed, in body, size No. 44 (.086 inch) drill.

Idle Port: Upper, slot type. Primary, length .136 inch; width .030 inch. Secondary, length .101 inch; width .030 inch.

Idle Port Opening: Primary, .084 to .092 inch above top edge of valve with valve tightly closed. Secondary, .071 to .077 inch.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill Secondary, constant feed, size .040 inch diameter.

Set Idle Adjustment Screw: 1 to 2 turns open. For richer mixture turn screw out. Do not idle engine below 500 RPM. in neutral.

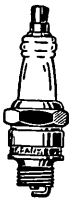
Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating jet (off nozzle well), primary side size No. 70 (.028 inch) drill.

Metering Rod: Primary, economy step .072 inch diameter. Middle step tapers to .060 inch diameter. Power step .048 inch diameter. Secondary, none.

Metering Rod Jet: Primary, size 0935 inch diameter (for metering rod). Secondary, size .053 inch diameter (no metering rod).

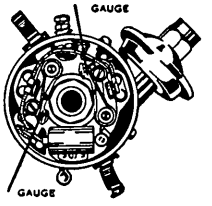
Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 70 (.028 inch) drill.
Intake ball check seat, size .115 to .120 inch diameter.
Discharge needle seat, size .070 inch diameter.
Relief passage (vent) to fuel chamber No. 42 (.0935 inch) drill.
Discharge relief plug, size No. 74 (.022 inch) drill.



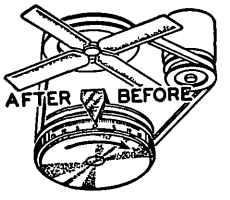
Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control, set on index. Butterfly type, offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 40 (.098 inch) drill.

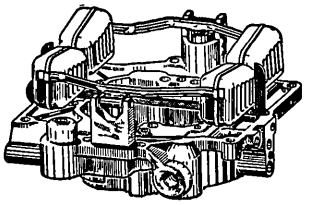


Vacuum Spark Port: Horizontal slot (round end) .045 by .110 inch. Top of port 032 to .042 inch above valve with valve tightly closed.

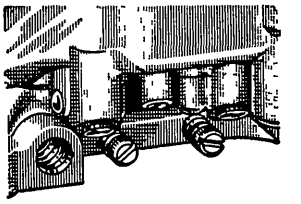
Motor Tune-Up—Be Accurate!



CAUTION: **Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.**



Spark Plug Gap .035"



Breaker Point Setting .017"

Ignition Timing Breaker Points to Open: 4° B. T. D. C.

CARBURETER ADJUSTMENTS

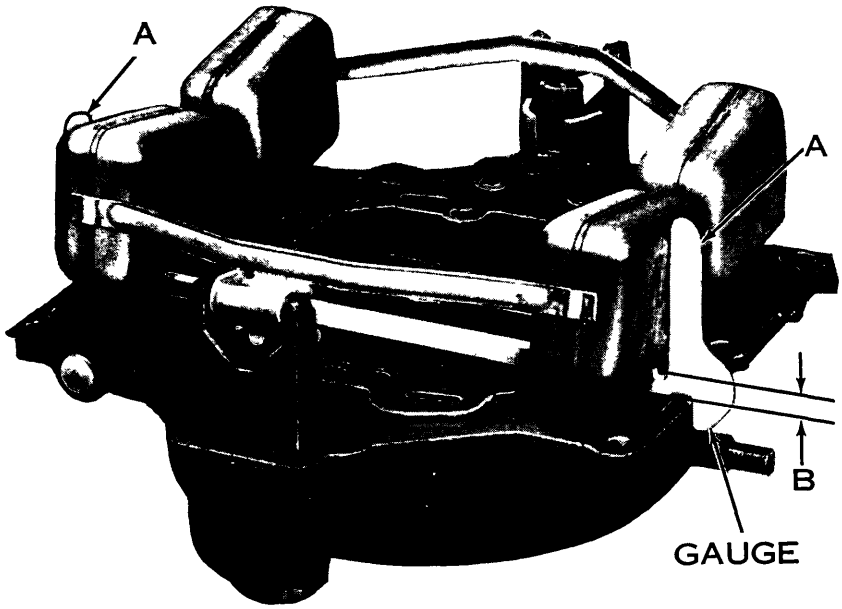

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1)

Two separate float adjustments must be made—lateral and vertical

LATERAL ADJUSTMENT With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge (A) Adjustment should be made by bending arms of floats

VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge Vertical distance (B) between top of float and machined surface of casting must be 1/8 inch (gauge T109 232) for primary floats and 3/16 inch (gauge T109 222) for secondary floats Adjust by bending float arms

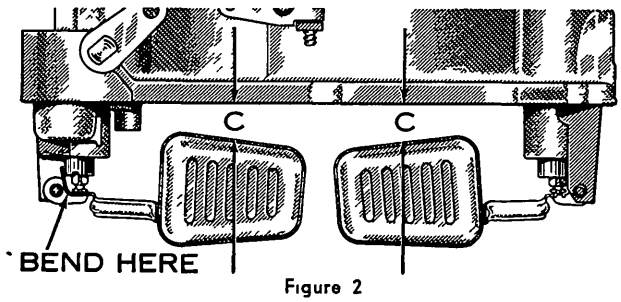

Figure 2
Float Drop Adjustment

FLOAT DROP ADJUSTMENT (Fig. 2)

With bowl cover held in upright position and measuring from center of floats the distance (C) between top of floats and bowl cover should be 5/8 inch for primary floats and 11/16 inch for secondary floats Adjust by bending stop tabs on float bracket

PUMP ADJUSTMENT (Fig. 3)

Install pump connector link in outer hole (long stroke) of pump arm, with ends extending outward toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109 213)

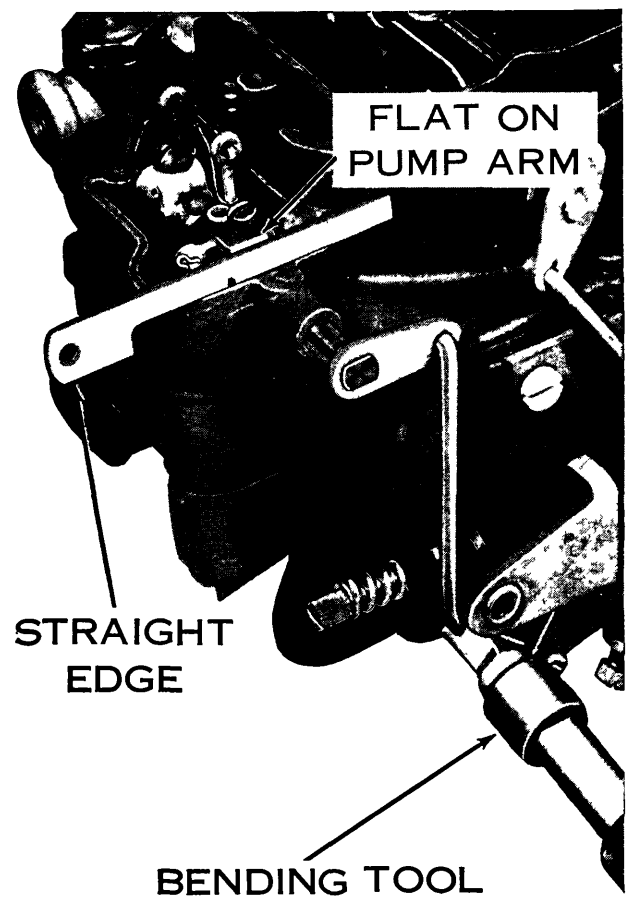

Figure 3
Pump Adjustment

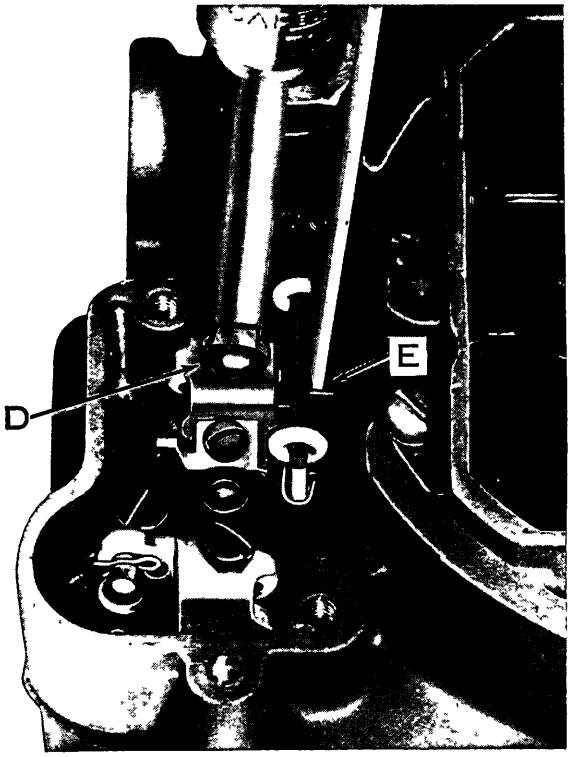

Figure 4
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 4):

Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (D). 2. With metering rods in place, press down on vacumeter link (E) until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw (D).

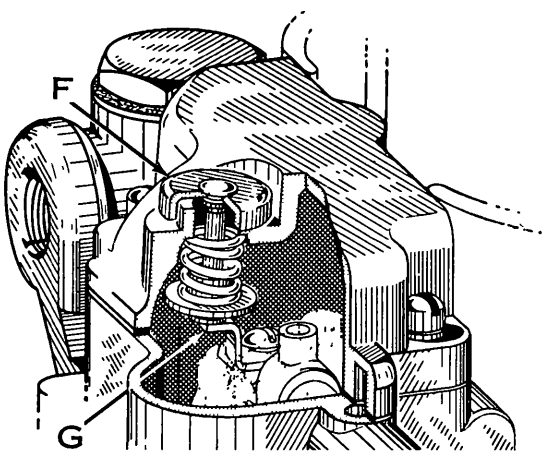

Figure 5
Bowl Vapor Vent Adjustment

BOWL VAPOR VENT ADJUSTMENT (Fig. 5):

This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (F) (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm (G).

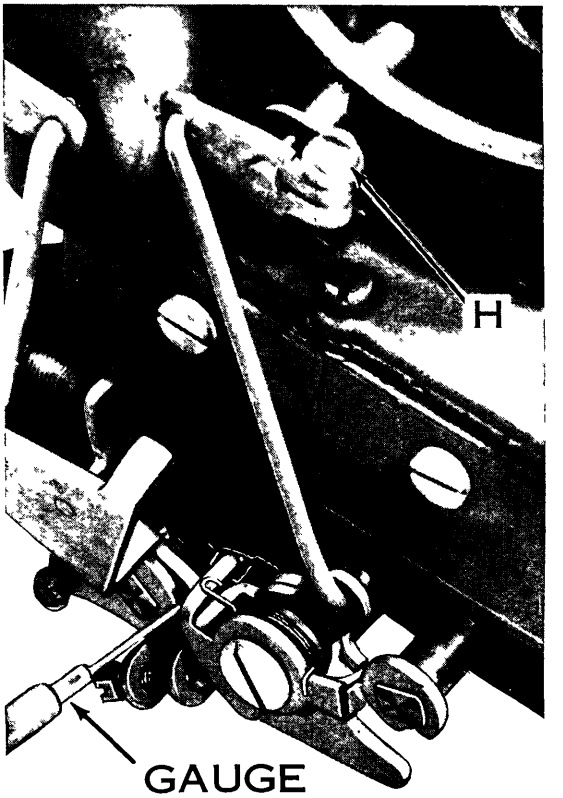

Figure 6A
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 6A and 6B):

(a) Loosen choke lever clamp screw (H) on choke shaft. Insert .010 inch wire gauge (T109-200) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (H). (b) With choke valve tightly closed, tighten fast idle adjusting screw (J) until there is .018 inch (gauge T109-44) opening between throttle valve and bore of carbureter side opposite idle port. Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

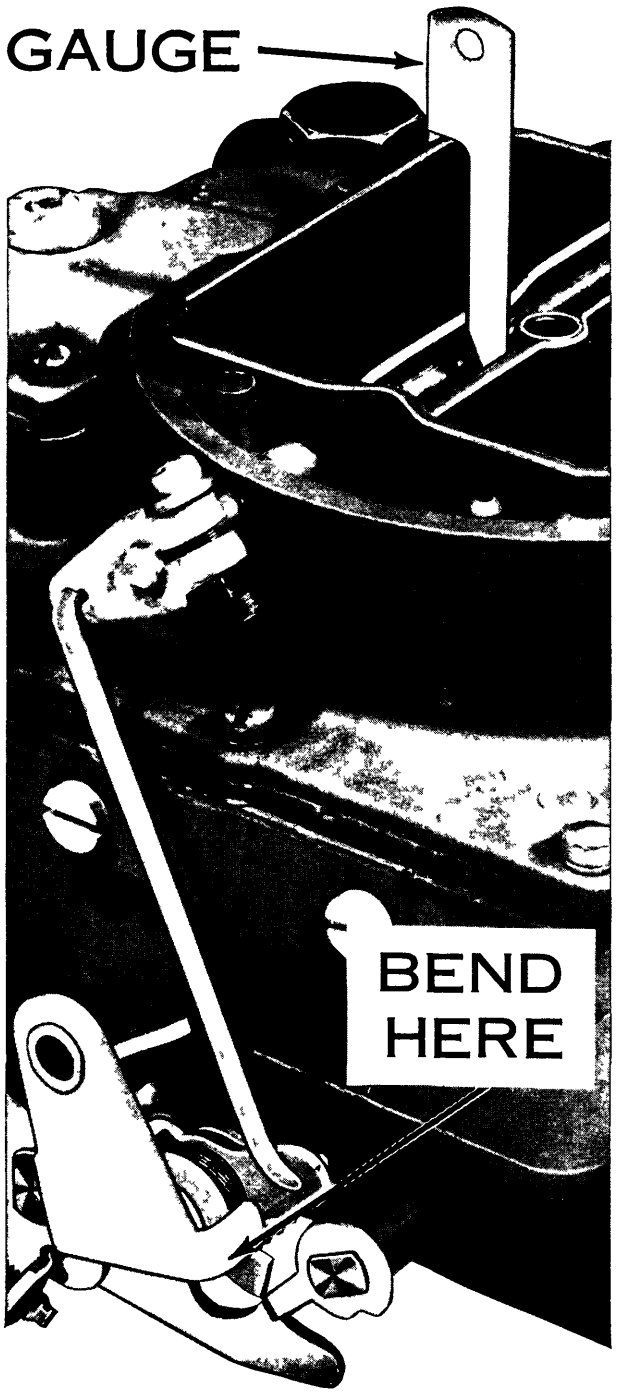

Figure 7
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 7)

With throttle wide open there should be 3/16 inch (gauge T109 28) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109 41)

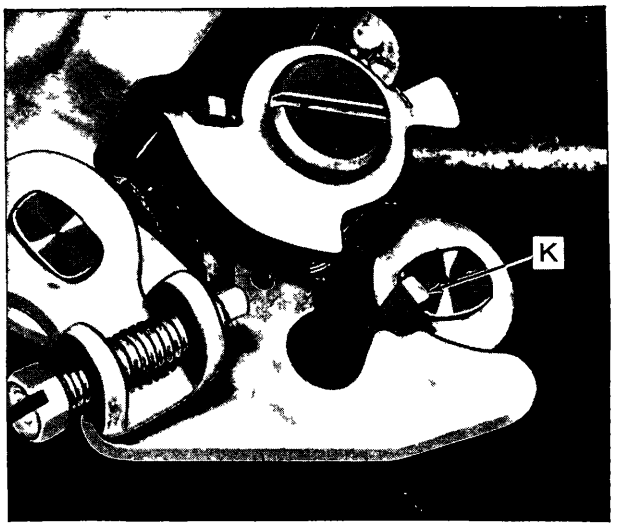

Figure 8
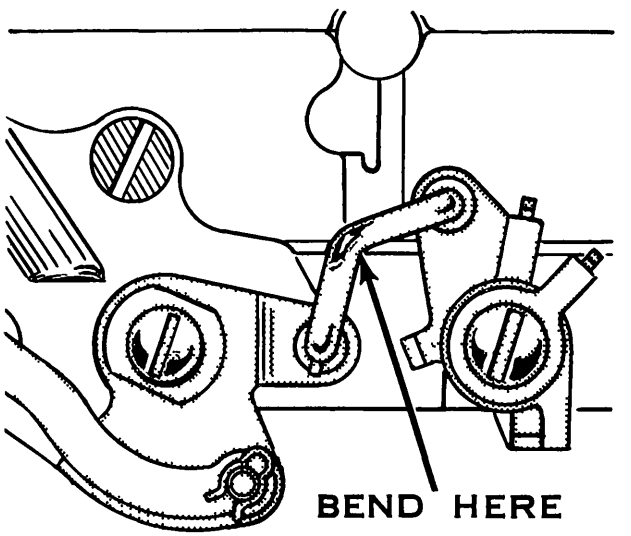
Secondary Throttle Lock-Out Adjustment

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 8): This adjustment should be made after completing fast idle and secondary throttle lever adjustments Crack throttle valves and manually open and close the choke valve Tang (K) on secondary throttle lever should freely engage in notch of lock out dog If necessary to adjust bend tang (K) on secondary throttle lever



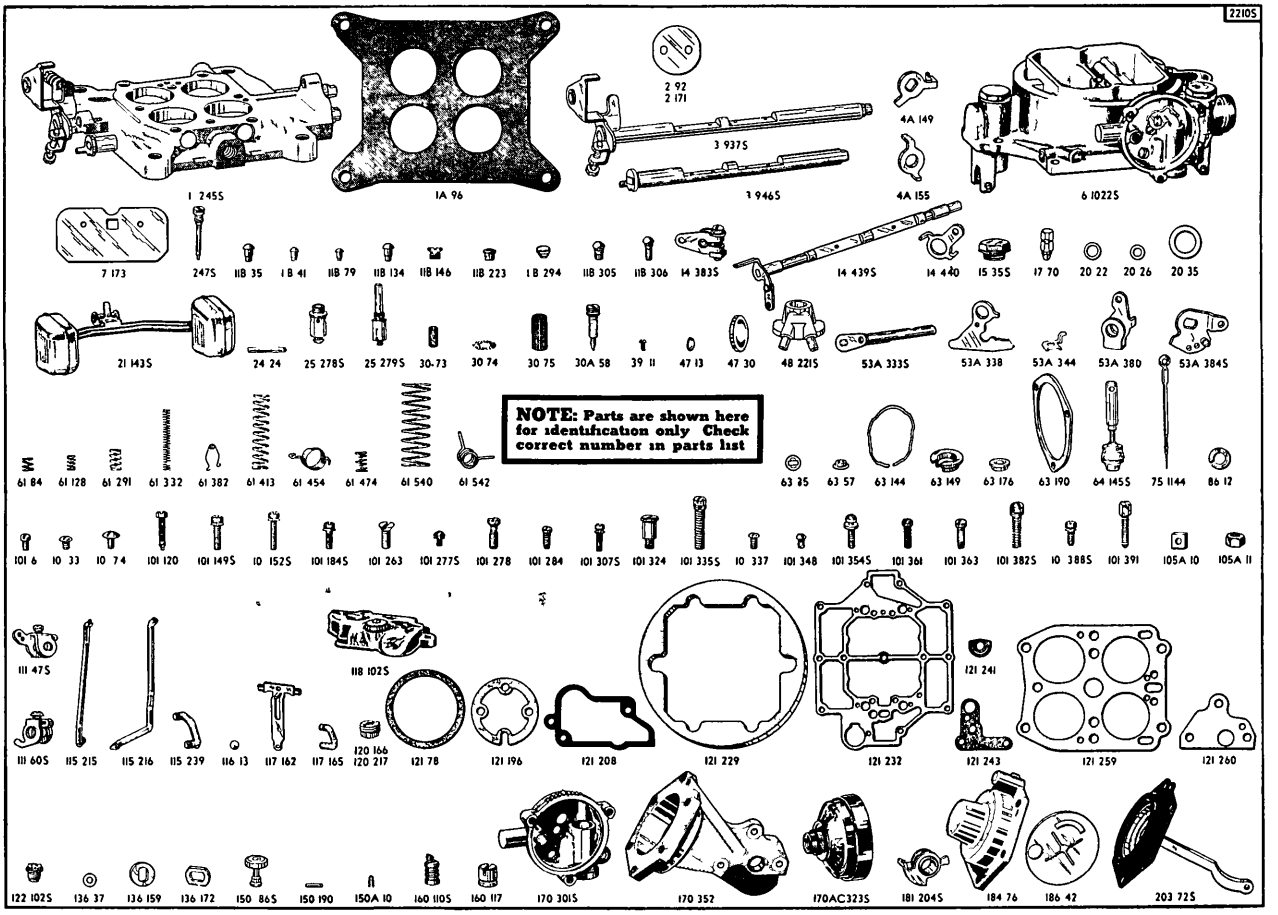


Figure 9
Secondary Throttle Lever Adjustments

SECONDARY THROTTLE LEVER ADJUSTMENT (Fig. 9)

1 Block choke valve wide open
2 Back out throttle lever stop screw so that primary valves seat in carburetor bores
3 While holding the secondary throttle open slightly close the primary valves The primary and secondary valves should become tightly closed at the same time Check to be sure that secondary throttle valves are tightly closed by attempting to open the secondary throttle valves while holding the primary throttle valves closed
4 To adjust bend the throttle operating rod slightly

1954

BB DOWN-DRAFT CLIMATIC® CONTROL CARBURETER No. E9B1

CARBURETER SPECIFICATIONS

For DeSoto 6 Cylinder Engine· 3-7/16 Inch Bore, 4½ Inch Stroke

Dimensions: Flange Size 1½ inch S A E Throttle bore 1-11/16 inch Main Venturi, 1-11/32 inch I D

Float Setting: See adjustments

Vents. Outside, none Inside balance vent tube in air horn above choke valve

Gasoline Intake: Size No 44 (086 inch) drill in needle seat

Idle Orifice Tube: Jet, size 0295 in diameter Idle passage air bleed in air horn, size No 56 (0465 inch) diameter Restriction in body size 0492 inch diameter

Idle Port: Upper port, slot type length 149 inch width 030 inch

Idle Port Opening: Top or port located 118 to 122 inch above top edge of valve, with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size 053 to 057 inch diameter

Set Idle Adjustment Screw: ½ to 1½ turns open For richer mixture turn screw out Idle engine at 500 r p m

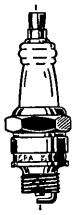
Main Metering Jet: Calibrated to flow 315 to 319 cc per minute (Do not gauge for size If in doubt replace with new part)

Main Vent: Through diffuser (air bleed inside bowl) Size 0315 inch diameter

Main Vent Tube: Side holes 4— 0354 inch diameter

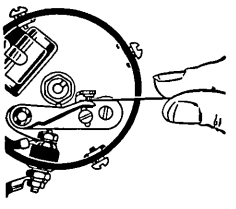
Step-Up Jet: Power orifice 0374 inch diameter

Accelerating Pump: Pump intake passage ball check seat size 107 to 112 inch diameter Pump discharge passage, restriction (unde ball check), size 062 to 065 inch diameter Pump (discharge) jet, size 0413 inch diameter



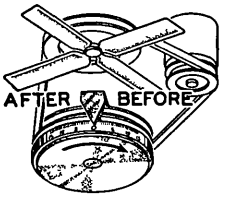
Pump Adjustment: See adjustments

Choke: Carter Climatic ® Control, set on Index Choke heat suction hole in flange insulator size No 38 (1015 inch) drill

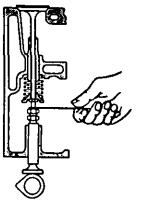


Vacuum Spark Port: Slot, round end type, size 040 by 110 inch Top of port 012 to 018 inch above top edge of valve with valve tightly closed

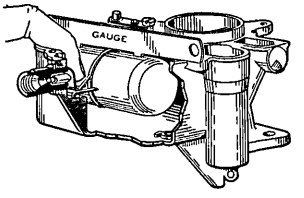
Motor Tune-Up—Be Accurate!



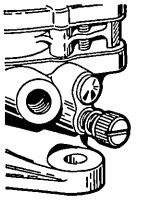
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and tests compression before adjusting carbureter



Spark Plug Gap .035"



Breaker Point Setting 020"



Ignition Timing Breaker Points to Open 2° B.T.D.C.

Valve Setting (Hot) Intake .008" Exhaust .010"

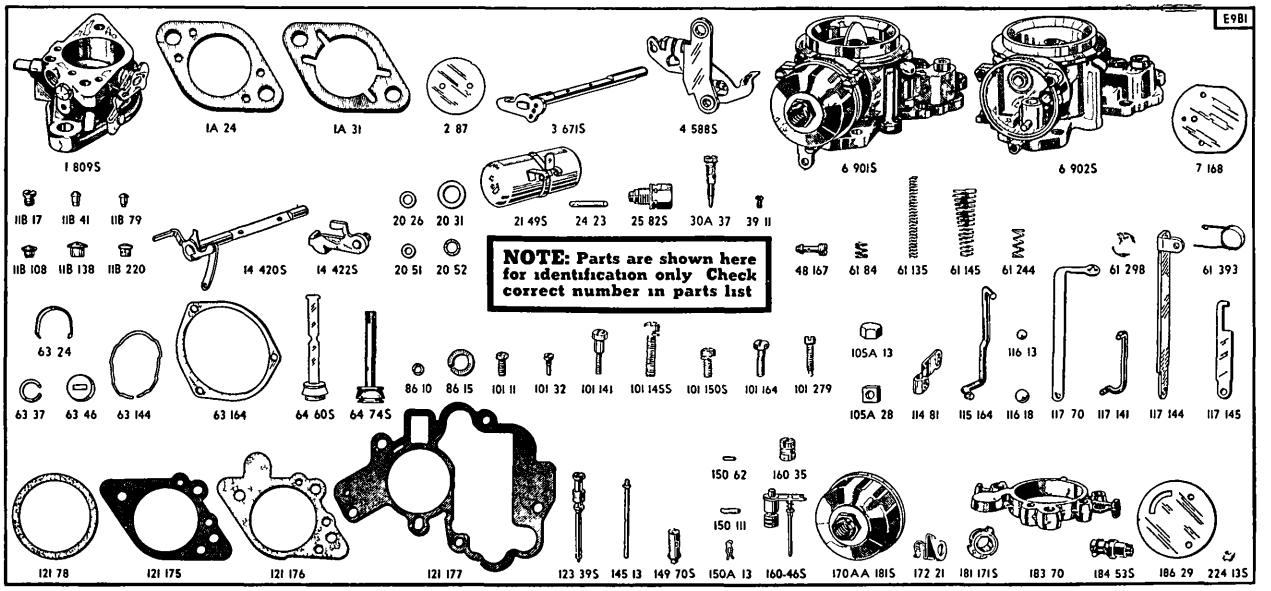
Float Setting 5/64 Inch ± 1/64 Inch (Use Gauge T109-50)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

Float Adjustment. This adjustment must be made with the bowl cover gasket and float pin retainer removed Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots The distance from the top surface of the body casting to the top of the float should be 5/64 inch (gauge T109-50) To adjust bend lip on float arm

Pump Adjustment: No gauge is necessary Pump lifter arm should be at a right angle to pump lifter shaft Adjustment can be made by bending pump lifter arm up or down (Use tool T109-41) Pump Stroke adjustable for high or low temperatures Set to longest stroke for cold weather shorter stroke for hot weather driving



Fast Idle Adjustment: Remove thermostatic coil housing assembly gasket and baffle plate With throttle adjusting screw backed out crack throttle valve and hold choke valve in fully closed position Then close throttle This will allow fast idle cam to revolve to fast idle position There should now be 015"- 019 ' clearance (use gauge T109-44) between throttle valve and bore of carbureter side opposite idle port Adjust by bending the choke connector rod at lower angle (use tool T109-41)

CARBURETER
TRADE MARK REG. U. S PAT OFF.
MARCA REGISTRADA

Unloader Adjustment This adjustment must be made after the fast idle adjustment Hold throttle valve wide open and close choke valve as far as possible without forcing There should now be 5/32 clearance (use gauge T109 154) between upper edge of choke valve and inner wall of air horn Adjust by bending arm on choke trip lever (use tool T109 214) When fast idle and unloader adjustments have been made assemble baffle plate coil housing gasket and thermostatic coil housing assembly on air horn Set Climatic ® Control at Index making sure that hook on coil has picked up coil shaft lever

Dash-Pot Adjustment Tighten adjustment screw — then turn counter clockwise 5 turns Further adjustment outward will increase the action of the dash pot and lengthen its retarding effect

BBD Dual Down-Draft Climatic® Control **Carbureters Nos.**

2067S-2068S-2070S-2129S-2130S-2131S

CARBURETER SPECIFICATIONS

For DeSoto 8 Cylinder Engine 3⅝ Inch Bore, 3 11/32 Inch Stroke

Dimensions Flange size 1¼ inch dual 4 bolt (water jacket) type
Throttle bore 1 7/16 inch I D
Primary venturi ⅜ inch I D
Main venturi 1 3/16 inch I D

Float Level See adjustments

Vent Inside balance vent tube to bowl in a r horn above choke valve

Gasoline Intake Size No 38 (1015 inch) drill hole in needle seat

Idle Tube Jet size 0295 inch drill
Idle bleed (In venturi cluster screw) size 063 inch drill
Idle restriction (In venturi cluster screw) size 0472 inch dr ll

Idle Port Upper slot type length 149 inch width 030 inch

Idle Port Opening 101 to 105 inch above upper edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw) Size 053 to 057 inch diameter

Set Idle Adjustment Screw ¼ to 1¼ turns open For richer mixture turn screw out With gear shift lever in neutral posi tion idle engine between 475 and 500 R P M

Main Nozzle Nozzle s installed permanently DO NOT RE MOVE

Main Vent Tube Side holes 4—0354 inch diameter Bleed in top of tube size 0196 inch drill

Step Up Rod (Vacuum operated) 024 inch d ameter Length (end of wire to inside of angle) 1⅜ inch

Metering Jet Calibrated to flow 353 to 357 cc per minute (Do not gauge for size if in doubt replace with new part)

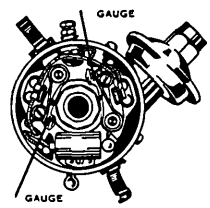
Accelerating Pump Pump discharge jets (2) size 0315 inch drill

Intake ball check seat size (2067S 2068S 2070S) 115 to 120 inch diameter (2129S 2130S 2131S) 135 to 140 inch diam eter

Discharge ball check seat size 115 to 120 inch diameter

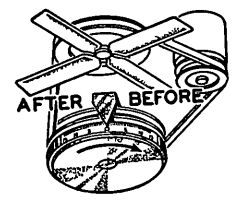
Pump Adjustment See adjustments

Choke Carter Climatic® Control set one notch lean Butter fly type offset valve Choke heat suction hole in body size No 38 (1015 inch) drill NOTE Thermostatic coil should not be removed from delayer mounting post If defective replace with complete thermostatic coil and housing assembly

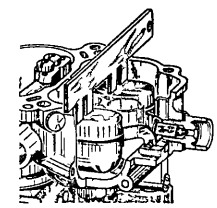


Vacuum Spark Port Horizontal round end type 030 by 110 inch Top of port to be 021 to 031 inch above upper edge of valve with valve closed tight

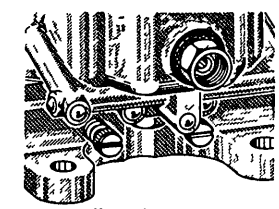
Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!



CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap 035"



Breaker Point Setting 017"

Ignition Timing Breaker Points to Open 4° B T D C

Float Setting (See Adjustments)

Idle Adjustment Screw Setting ¼ to 1¼ Turns Open

NOTE These cars equipped with Hydraulic Valve Lifters NO ADJUSTMENT

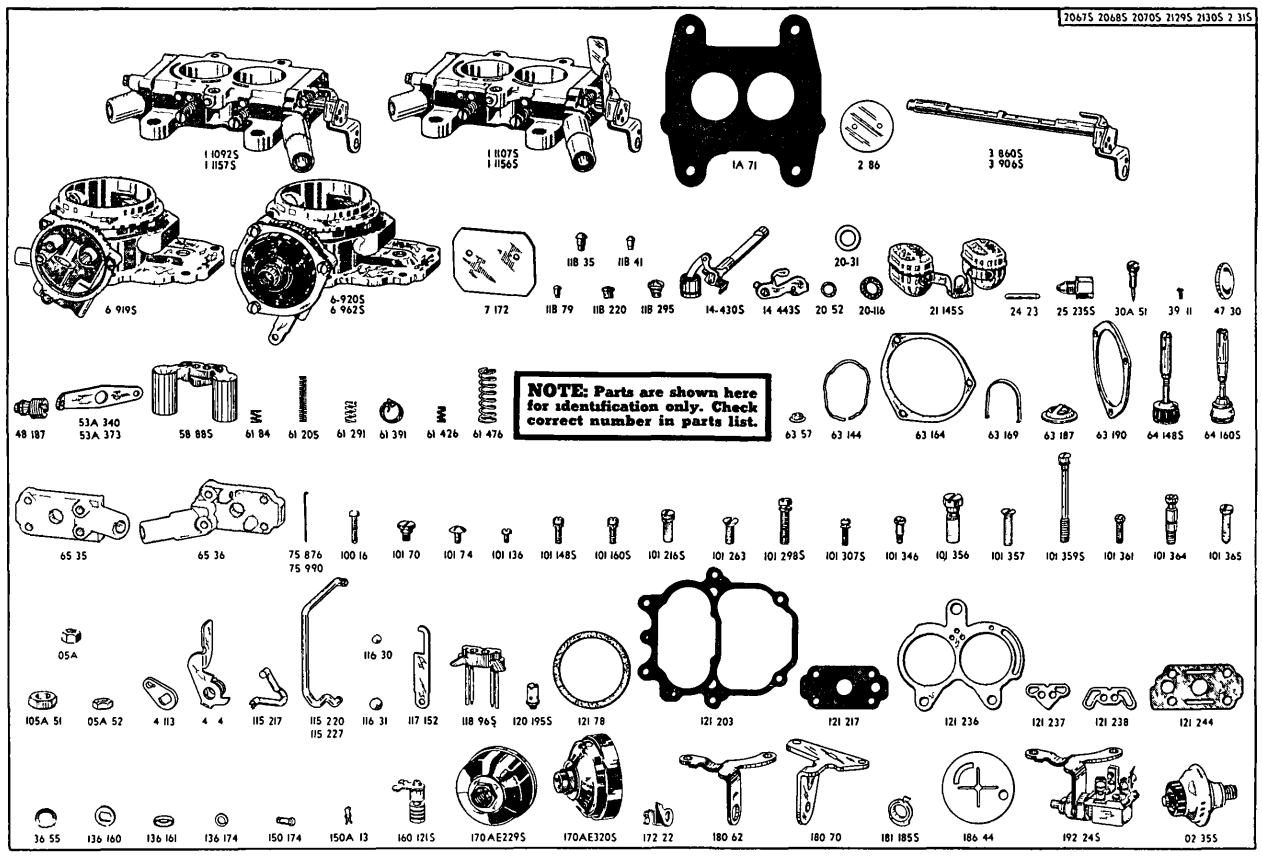
CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA

PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: This adjustment must be made with the bowl cover gasket and float pin retainer removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots. The distance from the top surface of the body casting to the top of each float should be 9/32 inch (gauge T109-239) for floats with flat top or 7/32 inch (gauge T109-239) for floats with curved top. If one float is lower than the other, equalize by bending the float arm. If both floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywhere against the innner walls of the bowl. If necessary, bend float arms slightly to provide clearance on all sides of floats.

PUMP ADJUSTMENT: Back out throttle adjustment screw and open choke valve so that throttle valves seat in bores of carbureter. Install pump connector rod in outer hole of throttle lever and pump arm pin in top hole of the plunger shaft. The distance from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 57/64 inch. Adjust by bending pump connector rod at lower angle (use tool T109-213).



FAST IDLE ADJUSTMENT: Remove thermostatic coil housing assembly, gasket and baffle plate. With throttle adjusting screw backed out, crack throttle valve and hold choke valve in fully closed position. Then close throttle. This will allow fast idle cam to revolve to fast idle position. There should now be .015"-.019" clearance (use gauge T109-44) between throttle valve and bore of carbureter (side opposite idle port). Adjust by bending the choke connector rod at lower angle (use tool T109-213).

UNLOADER ADJUSTMENT: This adjustment must be made after the fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing. There should now be 1/4 inch clearance (use gauge T109-31) between upper edge of choke valve and inner wall of air horn. Adjust by bending arm on choke trip lever (use tool T109-214) When fast idle and unloader adjustments have been made, assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn. Set Climatic® Control at "Index", making sure that hook on coil has picked up coil shaft lever.

DASH POT (SLOW CLOSING THROTTLE) ADJUSTMENT: (2070S-2131S ONLY) The purpose of the dashpot is to prevent the car from stalling when the throttle is released rapidly. Maximum dashpot action is obtained by loosening lock nut and adjusting the dashpot unit so that the dashpot plunger shaft can be moved inward approximately 1/16 inch with the throttle valves tightly closed. Then tighten lock nut.

OVERDRIVE KICKDOWN SWITCH ADJUSTMENT: (2068S-2130S ONLY) With throttle valves in wide open position adjust hex nuts on switch to have 1/64 inch to 3/64 inch clearance between kickdown lever and switch stem guide.

BBD Dual Down-Draft Climatic® Control **Carbureter No. 2250S**

CARBURETER SPECIFICATIONS

For DeSoto 8 Cylinder Engine. 3⅝ Inch Bore, 3-11/32 Inch Stroke

Dimensions. Flange size 1¼ inch dual, 4 bolt type
Throttle bore 1-7/16 inch I D
Primary venturi, ⅜ inch I D
Main venturi, 1-3/16 inch I D

Float Level See adjustments

Vent: Inside, balance vent tube to bowl, in air horn above choke valve

Gasoline Intake· Size No 38 (1015 inch) drill hole in needle seat

Idle Tube. Jet, size 0334 inch drill
Idle bleed (in venturi cluster screw), size 063 inch drill
Idle restriction (in venturi cluster screw), size 0472 inch drill

Idle Port: Upper, slot type, length, 149 inch; width, .030 inch

Idle Port Opening. 102 to 106 inch above upper edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size 053 to 057 inch diameter

Set Idle Adjustment Screw: ¼ to 1¼ turns open For richer mixture turn screw out With gear shift lever in neutral position idle engine between 475 and 500 RPM

Main Nozzle. Nozzle is installed permanently DO NOT REMOVE

Main Vent Tube Side holes 6—bottom three holes (from closed end) size 0354 inch next two holes 0236 inch, top hole 0197 inch diameter
Main vent in top of tube size 0275 inch diameter.

Step-Up Rod: (Vacuum operated) 024 inch diameter

Metering Jet: Calibrated to flow 356 to 364 cc per minute (Do not gauge for size if in doubt, replace with new part)

Accelerating Pump· Pump discharge jets (2—in venturi cluster), size 0275 inch drill
Intake ball check seat, size 135 to 140 inch diameter
Discharge ball check seat, size 110 to 120 inch diameter

Pump Adjustment: See adjustments

Choke Carter Climatic® Control, set at index Butterfly type offset valve Choke heat suction hole, in body, size No 38 (1015 inch) drill
NOTE Thermostatic coil should not be removed from delayer mounting post If defective replace with complete thermostatic coil and housing assembly.

Vacuum Spark Port. Horizontal, round end type, 030 by 110 inch Top of port to be 030 to 040 inch above upper edge of valve with valve closed tight

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open:	Float Setting	Idle Adjustment Screw Setting
.035"	.017"	4° B. T. D. C.	See Adjustments	¼ to 1¼ Turns Open Idle Engine at 475 to 500 R.P.M. In Neutral

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: This adjustment must be made with the bowl cover gasket and float pin retainer removed Hold the lip on float arm against the seated intake needle making sure the float pin is at the bottom of its guide slots The distance from the top surface of the body casting to the top of each float should be 7/32 inch (gauge T109-239) If one float is lower than the other, equalize by bending the float arm If both floats require the same correction, adjust by bending lip on float arm The floats must not rub anywhere against the inner walls of the bowl If necessary bend float arms slightly to provide clearance on all sides of floats

PUMP ADJUSTMENT: Back out throttle adjustment screw and open choke valve so that throttle valves seat in bores of carbureter Install throttle connector rod in outer hole (medium stroke) of throttle lever and inner hole of pump arm The distance from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 1 inch. Adjust by bending pump connector rod at upper angle (use tool T109-213)

FAST IDLE ADJUSTMENT: Remove thermostatic coil housing assembly gasket and baffle plate With throttle adjusting screw backed out, crack throttle valve and hold choke valve in fully closed position Then close throttle This will allow fast idle cam to revolve to fast idle position There should now be 015"-019" clearance (use gauge T109-44) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle (use tool T109-213)

UNLOADER ADJUSTMENT: This adjustment must be made after the fast idle adjustment Hold throttle valve wide open and close choke valve as far as possible without forcing There

MARCA REGISTRADA

S S PRINTED IN U S A

should now be 1/4 inch clearance (use gauge T109 31) between upper edge of choke valve and inner wall of air horn Adjust by bending arm on choke trip lever (use tool T109 214) When fast idle and unloader adjustments have been made assemble baffle plate coil housing gasket and thermostatic coil housing assembly on air horn Set Climatic® Control at Index making sure that hook on coil has picked up coil shaft lever

DASH POT (SLOW CLOSING THROTTLE) ADJUSTMENT The purpose of this unit is to prevent the car from stalling when the throttle is released rapidly Maximum action is obtained by loosening lock nut and adjusting the dash pot unit so that the plunger shaft can be bottomed with a 1/16 inch gauge placed between shaft and operating lever with throttle valves tightly closed Then tighten lock nut

NOTE Figures in parentheses indicate number of pieces used in one carbureter. Where no figure is shown, only on is used.

This Carbureter also used on Chrysler "C-51", "C-60" and "C-62" Cars equipped with Standard Clutch and Standard Transmission

DE SOTO MODELS S-15, S-18, S-20 1951-1954

(Standard Clutch And Transmission)

BB DOWN-DRAFT CLIMATIC® CONTROL **CARBURETERS Nos. E9C-E9C1**

CARBURETER SPECIFICATIONS

For De Soto 6 Cylinder Engine: 3-7/16 Inch Bore, 4½ Inch Stroke

Dimensions: Flange size, 1½ inch (38.1 mm). Throttle bore, 1-11/16 inch (42.86 mm). Main venturi, 1-11/32 inch (34.13 mm) I. D.

Float Setting: Top of float 5/64 inch (1.98 mm) below top surface of carbureter body casting. Plus or minus 1/64 inch (.397 mm).

Vents: Outside none. Inside balance vent tube in air horn, above choke valve.

Gasoline Intake Needle: Triangular, horizontal No. 44 (2.18 mm) drill in needle seat.

Idle Orifice Tube: Jet size, .0295 inch (.75 mm) drill. Idle passage air bleed, in air horn, size No. 56 (1.18 mm) drill diameter. Restriction in body, .0492 inch (1.25 mm) diameter.

Idle Ports: Upper port. Slot type: length .149 inch (3.78 mm), width .030 inch (.76 mm). Top of port located .118 to .122 inch (3.00 to 3.10 mm) above top edge of valve. Lower port size .053 to .057 inch (1.35 to 1.45 mm) drill. (For idle adjustment screw.)

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Idle engine between 450 and 500 r.p.m.

Main Metering Screw: Calibrated to flow 315 to 319 cc per minute. (Do not gauge for size. If in doubt replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl). Size .0315 inch (.80 mm) drill.

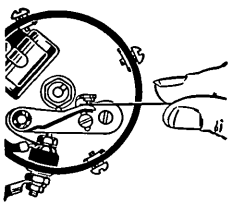
Main Vent Tube: Side Holes, 4—.0354 inch diameter.

Step-Up Jet: Power orifice .0374 inch (.95 mm) drill.

Accelerating Pump: Type—delayed action, seasonal adjustment Stroke—Summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke). Pump intake passage, ball check seat, size .107 to .112 inch (2.72 to 2.845 mm) diameter in body. Pump discharge passage: Restriction (under ball check) size .062 to .065 inch (1.57 to 1.65 mm) diameter in body. Pump (discharge) jet size .0413 inch (1.05 mm) drill

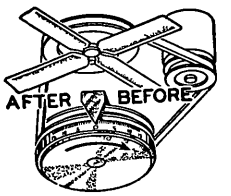
Pump Adjustment: None.

Choke: Carter Climatic® Control. Set at index. Choke heat suction hole, in flange insulator. Size No. 38 drill.

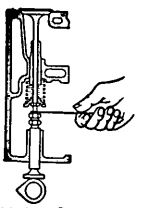


Vacuum Spark Port: Slot (round end) type; size .040 by .110 inch (1.016 by 2.794 mm). Top of port .012 to .018 inch (.305 to .457 mm) above top edge of valve.

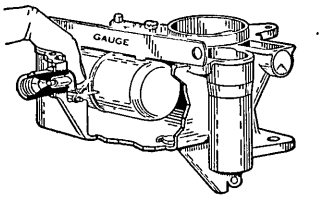
Motor Tune-Up—Be Accurate!



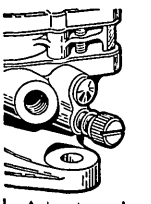
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open: 2° B. T. D. C.

Valve Setting (Hot) Intake .008" Exhaust .010"

Float Setting 5/64" ± 1/64" (Gauge T109-50)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs 450-500 r.p.m. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube passages with compressed air.

If acceleration is not satisfactory, remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. All jets must be seated gasoline tight. Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage. If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather.

Correct air fuel ratio is provided by a "balance tube" in the air horn. The balance tube should be checked each time the carbureter is serviced to see that the passage is open. The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner. Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed.

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube. After removal of rivet plug beneath float bowl with tool No. T109-43, main vent tube can be removed and a new tube inserted with tool No. T109-195. Care must be exercised in inserting new tube which must seat tightly. Use new rivet to complete the installation.

Pump Adjustment: No gauge is necessary. Pump lifter arm should be at a right angle to pump lifter shaft. Adjustment can be made by bending pump lifter arm up or down (use tool T109-41).

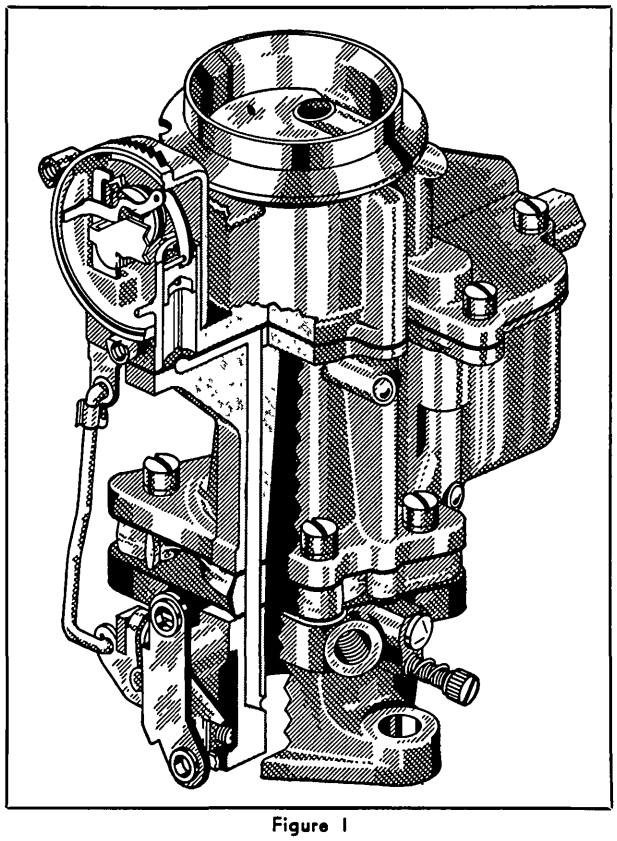

Figure 1

CARTER CLIMATIC® CONTROL CHOKE

The Carter Climatic® Control principle used in this unit is essentially the same as that used in WE type Carter carbureters. The fast idle cam assembly, unloader mechanism, etc., are located in the Climatic® Control housing. In this way all these parts are protected from dirt and other foreign matter. (Fig. 1) However, two important changes have been made. Hot air is introduced at the **center** of the Climatic® Control housing, is drawn through three passages in the housing, around the delayer plate to the thermostatic coil, and then to the manifold.

A **delayer plate** has been added to control the action of the choke, providing longer choke operation during warm-up and preventing the choke from closing too rapidly after the engine is shut off. It should not be necessary to remove the delayer plate and thermostatic coil assembly from the coil housing when servicing the choke. The thermostatic coil must not be removed from the delayer plate.

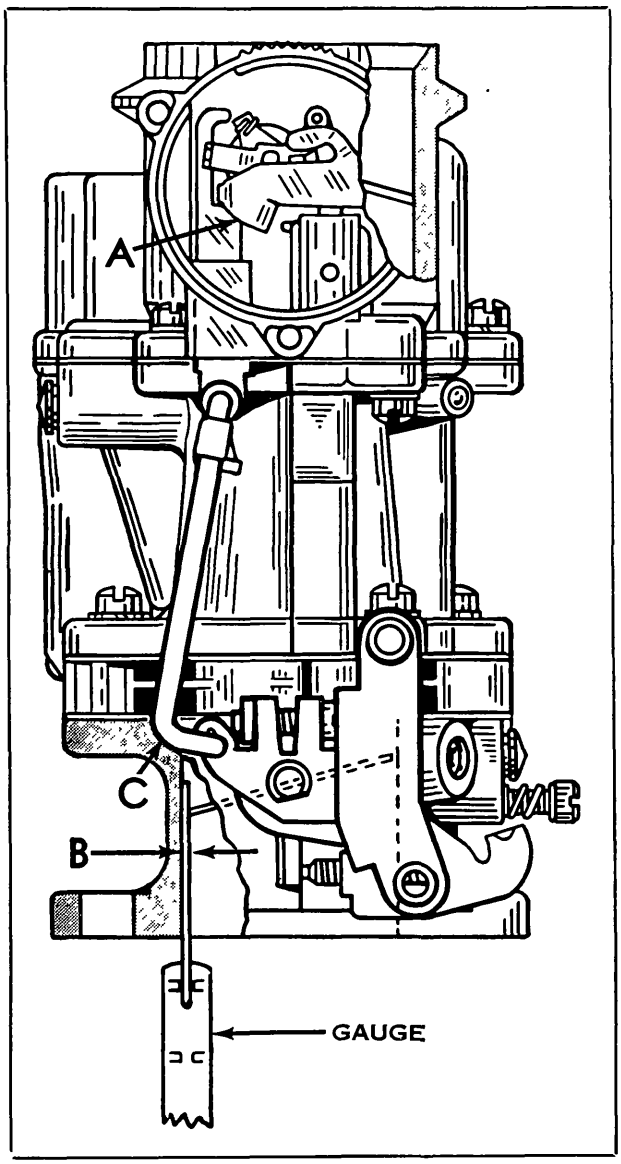

Figure 3
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 3):

Remove thermostatic coil housing assembly, gasket and baffle plate. With throttle adjusting screw backed out crack throttle valve and hold choke valve in fully closed position. Then close throttle. This will allow fast idle cam to revolve to fast idle position ("A"—Fig. 3). There should now be .015"-.019" clearance (use gauge T109-44) between throttle valve and bore of carbureter, side opposite idle port ("B"—Fig. 3). Adjust by bending the choke connector rod at lower angle ("C"—Fig 3) (use tool T109-41).

UNLOADER ADJUSTMENT (Fig. 4):

This adjustment must be made after the fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing. There should now be 5/32" clearance ("D"—Fig. 4) (use gauge T109-154) between upper edge of choke valve and inner wall of air horn Adjust by bending arm on choke trip lever ("E"—Fig. 4) (use tool T109-187). When fast idle and unloader adjustments have been made assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn. Set Climatic® Control at "Index", making sure that hook on coil has picked up coil shaft lever.

E7V1 - E7W1
(With Throttle Restrictor)

DE SOTO "CITY TRAFFIC" "S-13", "S-14"—1949-50 "S-15"—1951-52 "S-18"—1953 "S-20"—1954

B-B DOWN-DRAFT CARBURETERS—**MODELS E7V1-E7W1**

CARBURETER SPECIFICATIONS

For DeSoto Six Cylinder Engine: 3-7/16 Inch Bore, 4¼ Inch Stroke (1949-51)
For DeSoto Six Cylinder Engine: 3-7/16 Inch Bore, 4½ Inch Stroke (1952-54)

Dimensions: Flange size, 1½ inch (38.1 mm).
Throttle bore, 1-11/16 inch (42.86 mm).
Main venturi, 1-11/32 inch (34.13 mm) I. D.

Float Setting: Top of float 5/64 inch (1.98 mm) below top surface of carbureter body casting. (Plus or minus 1/64 inch (.397 mm).

Vents: Outside none. Inside balance vent .218 inch diameter (5.54 mm).

Gasoline Intake Needle: Triangular, horizontal No. 44 (2.18 mm) drill in needle seat.

Idle Orifice Tube: Jet size (E7V1) .0256 inch (.65 mm) drill; (E7W1) .0236 inch (.60 mm) drill. Idle passage air bleed, in body, (E7V1) size .063 inch (1.60 mm) diameter; (E7W1) in air horn, size .0465 inch (1.18 mm) diameter. Restriction in body, (E7V1) size .053 inch (1.35 mm) diameter; (E7W1) size .0452 inch (1.15 mm) diameter.

Idle Ports: (E7V1) Upper Port. Keyhole type: length .128 inch (3.25 mm); width .027 inch (.69 mm). .063 inch (1.60 mm) diameter hole at top. Top of port located .093 to .097 inch (2.36 to 2.46 mm) above top edge of valve.
(E7W1) Upper port. Slot type: length .149 inch (3.78 mm); width .030 inch (.76 mm). Top of port located .118 to .122 inch (3.00 to 3.10 mm) above top edge of valve.
Lower port size .053 to .057 inch (1.35 to 1.45 mm) drill. (For idle adjustment screw.)

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Idle engine between 450-500 r.p.m.

Main Metering Screw: (E7V1) Calibrated to flow 312 to 316 cc per minute; (E7W1) 315 to 319 cc per minute. (Do not gauge for size. If in doubt replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl). Size .0315 inch (.80 mm) drill.

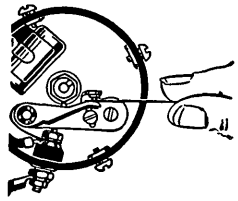
Main Vent Tube: Side holes, 4—.0354 inch diameter.

Step-Up Jet: Power orifice .0315 inch (.80 mm) drill.

Accelerating Pump: Type—delayed action. Stroke—Summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke).
Pump intake passage, seat size .107 to .112 inch (2.72 to 2.84 mm) diameter in body.
Pump discharge passage: Restriction (under ball check) size .062 to .065 inch (1.57 to 1.65 mm) diameter in body.
Pump (discharge) jet size, .0334 inch (.85 mm) drill.

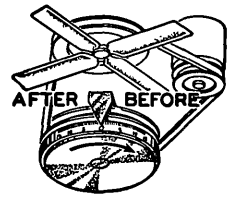
Pump Adjustment: (E7W1 equipped with 3-452S or 3-459S, and also E7V1). 26/64 inch plunger travel—full throttle position, medium stroke. Use gauge T109-117S. (E7W1 equipped with 3-728S). None.

Choke: Offset butterfly type, with poppet valve.

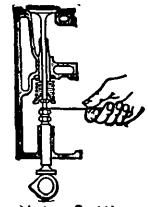


Vacuum Spark Port: Slot (round end) type; size .040 by .110 inch (1.016 by 2.794 mm). Top of port .052 to .058 inch (1.32 to 1.47 mm) above top edge of valve.

Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!



CAUTION: Change worn or leaky flange gasket. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap
.038" (E7V1)

5/64 Inch

Idle Adjustment Screw Setting
½ to 1½
Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs between 450-500 r. p. m. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube passages with compressed air.

If acceleration is not satisfactory, remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. All jets must be seated gasoline tight. Poor acceleration may be due to damaged or worn plunger leather in accelerating pump.

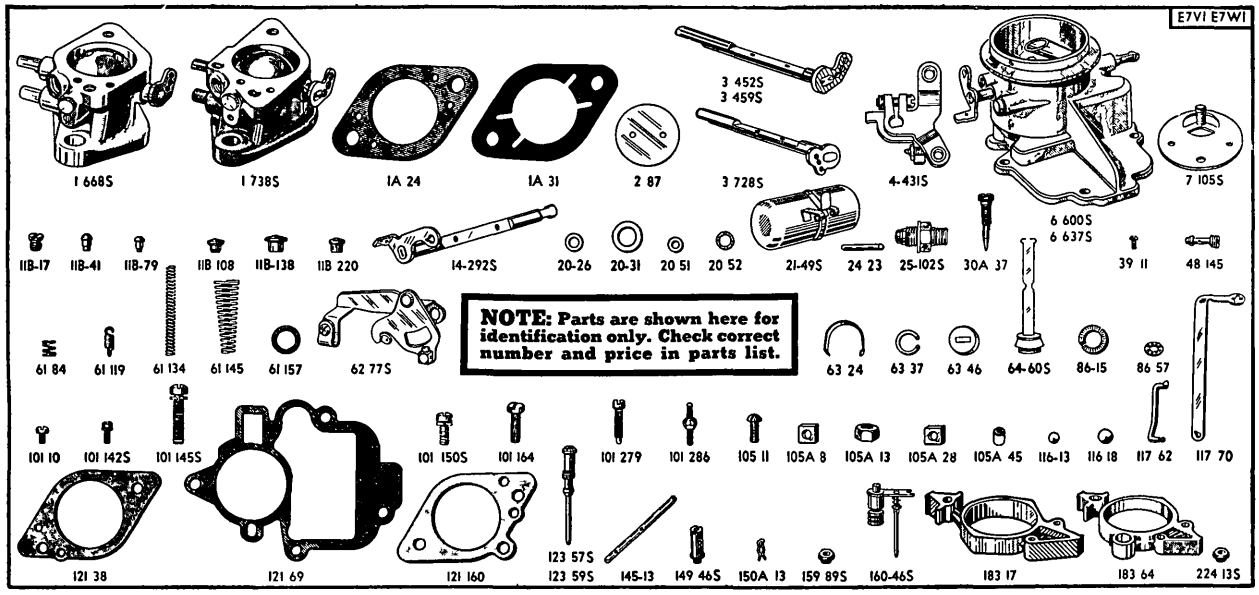
CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather



Correct air fuel ratio is provided by a "balance tube" in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type size or condition of air cleaner Should the cleaner become clogged the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43 main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation.

Pump Adjustment (E7W1 equipped with 3-452S or 3-459S, and also E7V1) Remove air horn assembly, back out throttle adjustment screw, and place pump operating link in center hole of throttle shaft arm Place gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft Turn knurled nut of gauge until lip contacts plunger shaft at closed and wide open throttle positions Difference in readings obtained at closed and wide open throttle positions should be "26" (26/64') plunger travel

(E7W1 equipped with 3-728S) No gauge is necessary Be sure pump lifter link arm is at right angle to lifter link shaft Adjustments can be made by bending horizontal portion of pump lifter link

Pump stroke adjustable for high or low temperature Set to long stroke for cold weather, short stroke for hot weather driving

2250 can be used in place of 912S—remove dashpot

2250S with 192-34U can be used in place of 913S and remove dashpot

BBD Dual Down-Draft Climatic® Control **Carbureters Nos. 911S-912S-913S**

CARBURETER SPECIFICATIONS

For DeSoto 8 Cylinder Engine 3⅝ Inch Bore, 3-11/32 Inch Stroke

Dimensions Flange size 1¼ inch dual 4 bolt (water jacket) type
Throttle bore 1 7/16 inch I D
Primary venturi ⅜ inch I D
Main venturi 1 3/16 inch I D

Float Level See adjustments

Vent Inside balance vent tube to bowl in air horn above choke valve
Kickdown switch vent tube (911S) in air horn above choke valve

Gasoline Intake Size No 38 (.1015 inch) drill hole in needle seat

Idle Tube Jet size 0295 inch drill
Idle bleed (In venturi cluster screw) size 059 inch drill
Idle restriction (In venturi cluster screw) size 0472 inch drill

Idle Port Upper slot type length 149 inch width 030 inch

Idle Port Opening 101 to 105 inch above upper edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw) Size 053 to 057 inch diameter

Set Idle Adjustment Screw ¼ to 1¼ turns open For richer mixture turn screw out With gear shift lever in neutral position idle engine between 475 and 500 R P M

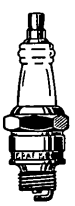
Main Nozzle Nozzle is installed permanently DO NOT REMOVE

Main Vent Tube Side holes (4) 0354 inch diameter
Bleed in top of tube size 0196 inch diameter

Step Up Rod (Vacuum operated) 022 inch diameter Length (end of wire to inside of angle) 1 11/32 inch

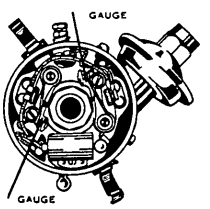
Metering Jet Calibrated to flow 338 to 342 cc per minute (Do not gauge for size if in doubt replace with new part)

Accelerating Pump Pump discharge jets (2) size 0315 inch drill
Intake ball check seat size 115 to 120 inch diameter
Discharge ball check seat size 115 to 120 inch diameter



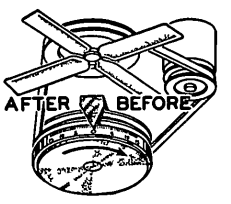
Pump Adjustment See adjustments

Choke Carter Climatic® Control set at index Butterfly type offset valve Choke heat suction hole in body size No 38 (.1015 inch) drill NOTE Thermostatic coil should not be removed from delayer mounting post If defective replace with complete thermostatic coil and housing assembly

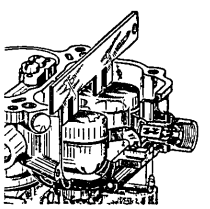


Vacuum Spark Port Horizontal round end type (Early prod.) 020 by 110 inch (late prod.) 030 by 110 inch Top of port to be (early prod.) 017 to 023 inch (late prod.) 021 to 031 inch above upper edge of valve with valve tightly closed

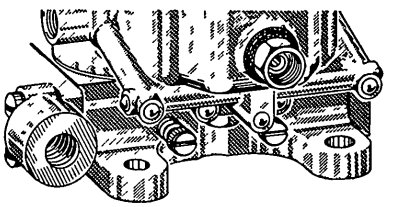
Motor Tune-Up—Be Accurate!



CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap .035"



Breaker Point Setting .017"

Ignition Timing Breaker Points to Open 4° B T D C

Float Setting (See Adjustments)

Idle Adjustment Screw Setting ¼ to 1¼ Turns Open

NOTE These cars equipped with Hydraulic Valve Lifters NO ADJUSTMENT

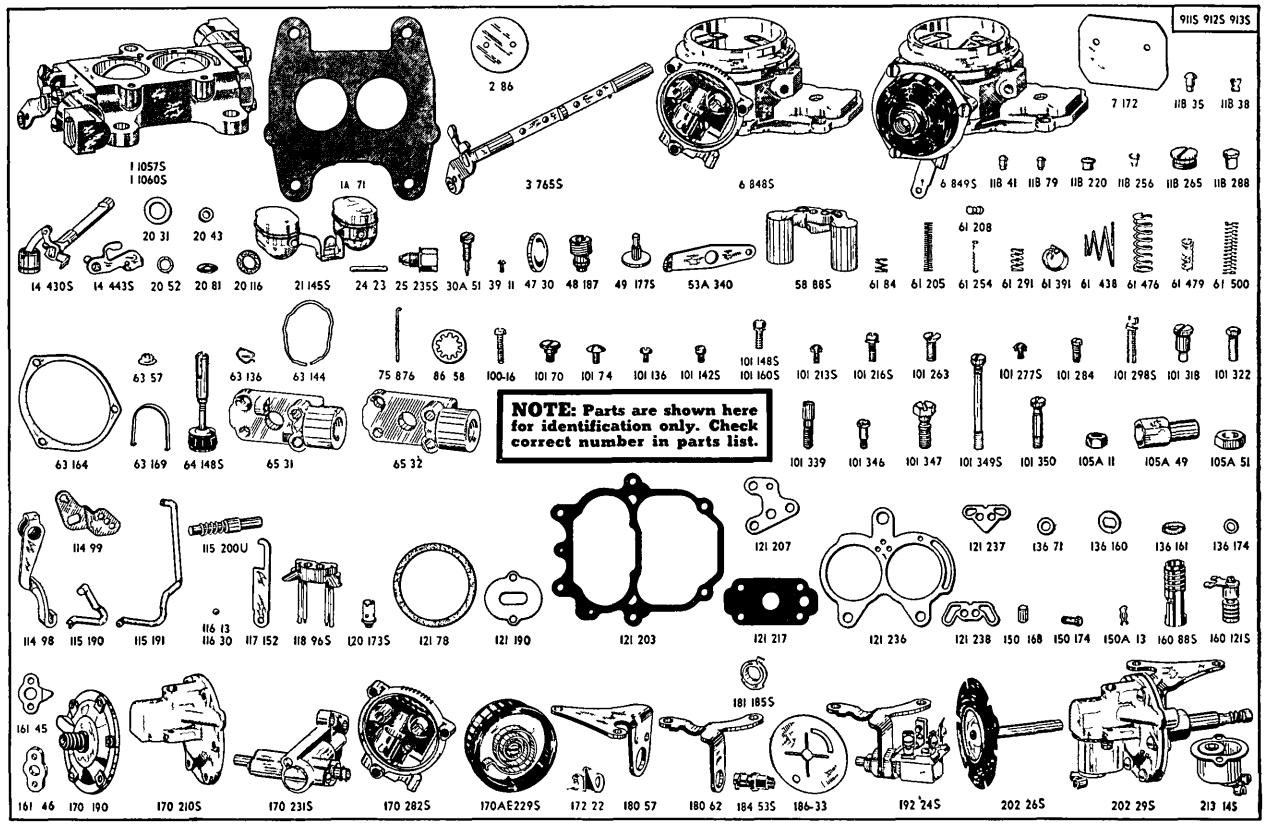
CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: This adjustment must be made with the bowl cover gasket and float pin retainer removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots. The distance from the top surface of the body casting to the top of each float should be 9/32 inch (gauge T109-239) for floats with flat top or 7/32 inch (gauge T109-239) for floats with curved top. If one float is lower than the other, equalize by bending the float arm. If both floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywhere against the inner walls of the bowl. If necessary, bend float arms slightly to provide clearance on all sides of floats.

PUMP ADJUSTMENT: Back out throttle adjusting screw and open choke valve so that throttle valves seat in bores of carbureter. Install pump connector rod in outer hole of throttle shaft arm and pump arm pin in top hole of the plunger shaft. The distance from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 57/64 inch. Adjust by bending pump connector rod at lower angle (use Tool T109-213).



FAST IDLE ADJUSTMENT: Remove thermostatic coil housing assembly, gasket and baffle plate. With throttle adjusting screw backed out, crack throttle valve and hold choke valve in fully closed position. Then close throttle. This will allow fast idle cam to revolve to fast idle position. There should now be .015"-.019" clearance (use gauge T109-44) between throttle valve and bore of carbureter (side opposite idle port). Adjust by bending the choke connector rod at lower angle (use tool T109-213).

UNLOADER ADJUSTMENT: This adjustment must be made after the fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing. There should now be 1/4 inch clearance (use gauge T109-31) between upper edge of choke valve and inner wall of air horn. Adjust by bending arm on choke trip lever (use tool T109-214). When fast idle and unloader adjustments have been made, assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn. Set Climatic® Control at "Index", making sure that hook on coil has picked up coil shaft lever.

DASH POT (SLOW CLOSING THROTTLE) ADJUSTMENT: (911S ONLY) The purpose of the dashpot is to prevent the car from stalling when the trottle is released rapidly. Maximum dashpot action is obtained by adjustment of diaphragm adjusting screw so that the dashpot plunger shaft can be moved inward approximately 1/16 inch after engine and throttle have returned to normal idle. This adjustment should be made with the carbureter on the car, with engine running and transmission in driving range.

OVERDRIVE KICKDOWN SWITCH ADJUSTMENT: (913S ONLY) (1) With throttle valves seated in bores of carbureter and kickdown switch lever held against stop on switch bracket, bend lip on throttle lever until it just contacts kickdown lever. (2) With throttle valves in wide open position adjust hex nuts on switch to have 1/64 inch to 3/64 inch clearance between kickdown lever and switch stem guide.

FLUID DRIVE OR TORQUE CONVERTER AND M6 TRANSMISSION

BBD Dual Down-Draft Climatic® Control Carbureter **No. 2216S**

CARBURETER SPECIFICATIONS

For De Soto 8 Cylinder Engine: 3⅝ Inch Bore, 3-11/32 Inch Stroke

Dimension: Flange size, 1¼ inch dual 4 bolt (water jacket) type
Throttle bore, 1 7/16 inch I D
Primary venturi ⅜ inch I D
Main venturi 1-3/16 inch I D

Vent. Inside balance vent tube to bowl, in air horn above choke valve
Kickdown switch vent tube in air horn above choke valve

Gasoline Intake. Size No 38 (.1015 inch) drill hole in needle seat

Idle Tube: Jet size 0334 inch drill
Idle bleed (in venturi cluster screw), size 0629 inch drill
Idle restriction (in venturi cluster screw) size 0472 inch drill

Idle Port: Upper, slot type length .149 inch, width .030 inch

Idle Port Opening: .102 to .106 inch above upper edge of valve with valve tightly closed

Lower Port (For idle adjustment screw): Size .053 to .057 inch diameter

Set Idle Adjustment Screw: ¼ to 1¼ turns open For richer mixture, turn screw out. With gear shift lever in neutral position idle engine between 475 and 500 R P M

Main Nozzle: Nozzle is installed permanently DO NOT REMOVE

Main Vent Tube: Side holes (6) from closed end first three holes size .0354 inch, next two holes .0236 inch, last hole .0197 inch diameter Bleed in top of tube, size .0275 inch diameter.

Step-Up Rod. (Vacuum operated) .024 inch diameter Length (end of wire to inside of angle) 1⅜ inch

Metering Jet: Calibrated to flow 338 to 342 cc per minute (Do not gauge for size, if in doubt, replace with new part)

Accelerating Pump: Pump discharge jets (2), size .0295 inch drill Intake ball check seat, size .130 to .140 inch diameter. Discharge ball check seat, size .110 to .120 inch diameter

Choke: Carter Climatic® Control, set at index Butterfly type, offset valve Choke heat suction hole, in body, size No 38 (.1015 inch) drill NOTE Thermostatic coil should not be removed from delayer mounting post If defective replace with complete thermostatic coil and housing assembly.

Vacuum Spark Port: Horizontal, round end type .030 by .110 inch Top of port to be .030 to .040 inch above upper edge of valve with valve tightly closed

---

Motor Tune-Up—Be Accurate!

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open: 4° B. T. D. C. At Vibration Damper	Float Setting 7/32 Inch (Use Gauge T109-239)	Idle Adjustment Screw Setting ¼ to 1¼ Idle engine at 475 to 500 R.P.M. in Neutral

NOTE: These cars equipped with Hydraulic Valve Lifters. NO ADJUSTMENT.

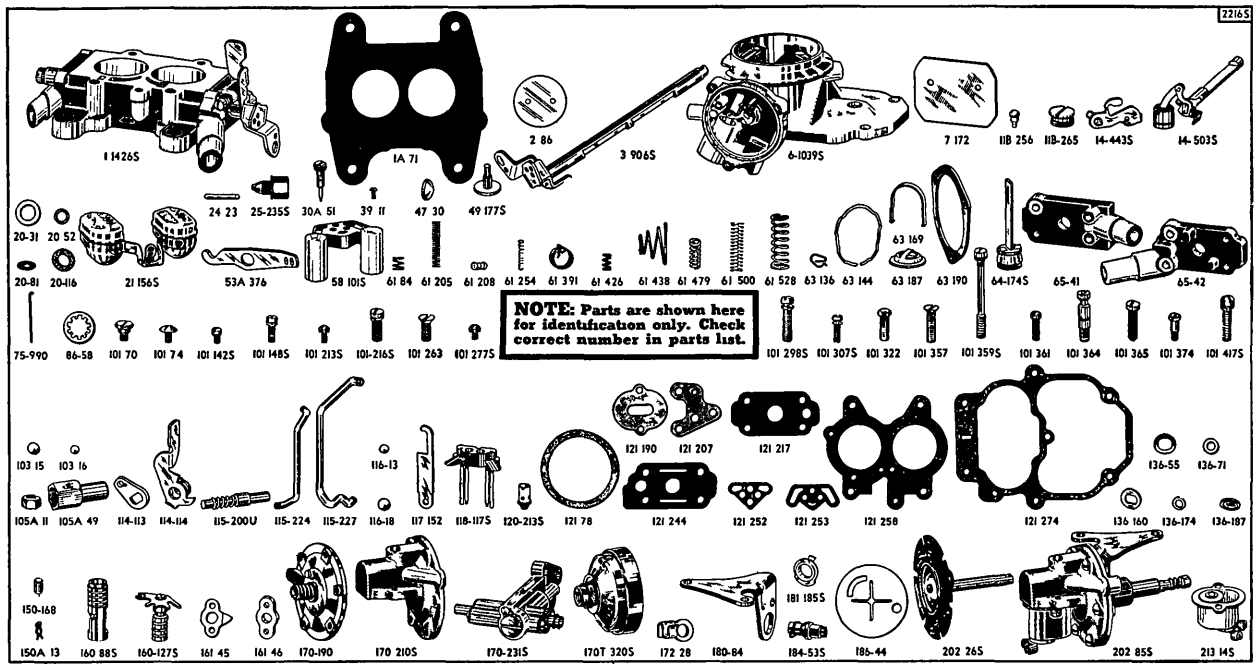
CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: This adjustment must be made with the bowl cover gasket and float pin retainer removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots. The distance from the top surface of the body casting to the top of each float should be 7/32 inch (gauge T109-239). If one float is lower than the other, equalize by bending the float arm. If both floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywhere against the inner walls of the bowl. If necessary, bend float arms slightly to provide clearance on all sides of floats.



PUMP ADJUSTMENT: Back out throttle adjusting screw and open choke valve so that throttle valves seat in bores of carbureter. Install pump connector rod in outer hole of throttle lever and inner hole of pump arm. The distance from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 1 inch. Adjust by bending pump connector rod at lower angle (use tool T109-213).

FAST IDLE ADJUSTMENT: Remove thermostatic coil housing assembly, gasket and baffle plate. With throttle adjusting screw backed out, crack throttle valve and hold choke valve in fully closed position. Then close throttle. This will allow fast idle cam to revolve to fast idle position. There should now be .015"-.019" clearance (use gauge T109-44) between throttle valve and bore of carbureter (side opposite idle port). Adjust by bending the choke connector rod at lower angle (use tool T109-213).

UNLOADER ADJUSTMENT: This adjustment must be made after the fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing. There should now be 1/4 inch clearance (use gauge T109-31) between upper edge of choke valve and inner wall of air horn. Adjust by bending arm on choke trip lever (use tool T109-214). When fast idle and unloader adjustments have been made, assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn. Set Climatic® Control at "Index," making sure that hook on coil has picked up coil shaft lever.

DASH POT (SLOW CLOSING THROTTLE) ADJUSTMENT: The purpose of the dashpot is to prevent the car from stalling when the throttle is released rapidly. Maximum dashpot action is obtained by adjustment of diaphragm adjusting screw so that the dashpot plunger shaft can be moved inward approximately 1/16 inch after engine and throttle have returned to normal idle. This adjustment should be made with the carbureter on the car, with engine running and transmission in driving range.

BBD Dual Down-Draft Climatic® Control **Carbureters Nos. 908S-909S-910S**

CARBURETER SPECIFICATIONS

For DeSoto 8 Cylinder Engine: 3⅝ Inch Bore, 3-11/32 Inch Stroke

Dimensions: Flange size, 1¼ inch dual, 4 bolt (water jacket) type.
Throttle bore, 1-7/16 inch I. D.
Primary venturi, ⅜ inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: See adjustments.

Vent: Inside, balance vent tube to bowl, in air horn above choke valve.
Kickdown switch vent tube (908S), in air horn above choke valve.

Gasoline Intake: Size No. 38 (.1015 inch) drill hole in needle seat.

Idle Tube: Jet, size .0295 inch drill.
Idle bleed (In venturi cluster screw), size .059 inch drill.
Idle restriction (In venturi cluster screw), size .0472 inch drill

Idle Port: Upper, slot type, length, .149 inch; width, .030 inch.

Idle Port Opening: .101 to .105 inch above upper edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size, .053 to .057 inch diameter.

Set Idle Adjustment Screw: ¼ to 1¼ turns open. For richer mixture, turn screw out. With gear shift lever in neutral position idle engine between 475 to 500 R.P.M.

Main Nozzle: Nozzle is installed permanently, DO NOT REMOVE.

Main Vent Tube: Side holes, 4—0354 inch diameter. Bleed in top of tube, 0196 inch diameter.

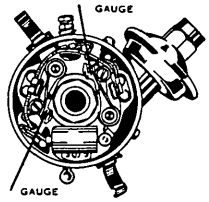
Step-Up Rod: (Vacuum operated) .022 inch diameter. Length (end of wire to inside of angle), 1-11/32 inch.

Metering Jet: Calibrated to flow 338 to 342 cc per minute (Do not gauge for size, if in doubt, replace with new part.)

Accelerating Pump: Pump discharge jets (2), size 0315 inch drill
Intake ball check seat, size .115 to .120 inch diameter
Discharge ball check seat, size .115 to .120 inch diameter.

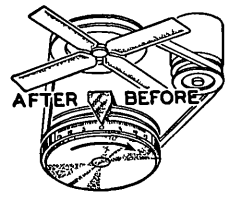
Pump Adjustment: See adjustments.

Choke: Carter Climatic ® Control, set at index. Butterfly type, offset valve. Choke heat suction hole, in body, size No. 38 (.1015 inch) drill. NOTE: Thermostatic coil should not be removed from delayer mounting post. If defective replace with complete thermostatic coil and housing assembly.

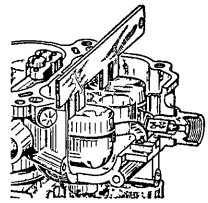


Vacuum Spark Port: Horizontal, round end type. (Early prod.) .020 by 110 inch; (late prod.) .030 by .110 inch. Top of port to be ,early prod.) .017 to .023 inch; (late prod.) .021 to .031 inch above upper edge of valve with valve closed tight.

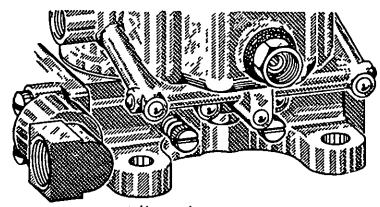
Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting .017"

Ignition Timing Breaker Points to Open: 4° B. T. D. C.

Float Setting See Adjustments

Idle Adjustment Screw Setting ¼ to 1¼ Turns Open

NOTE: These cars equipped with Hydraulic Valve Lifters. NO ADJUSTMENT.

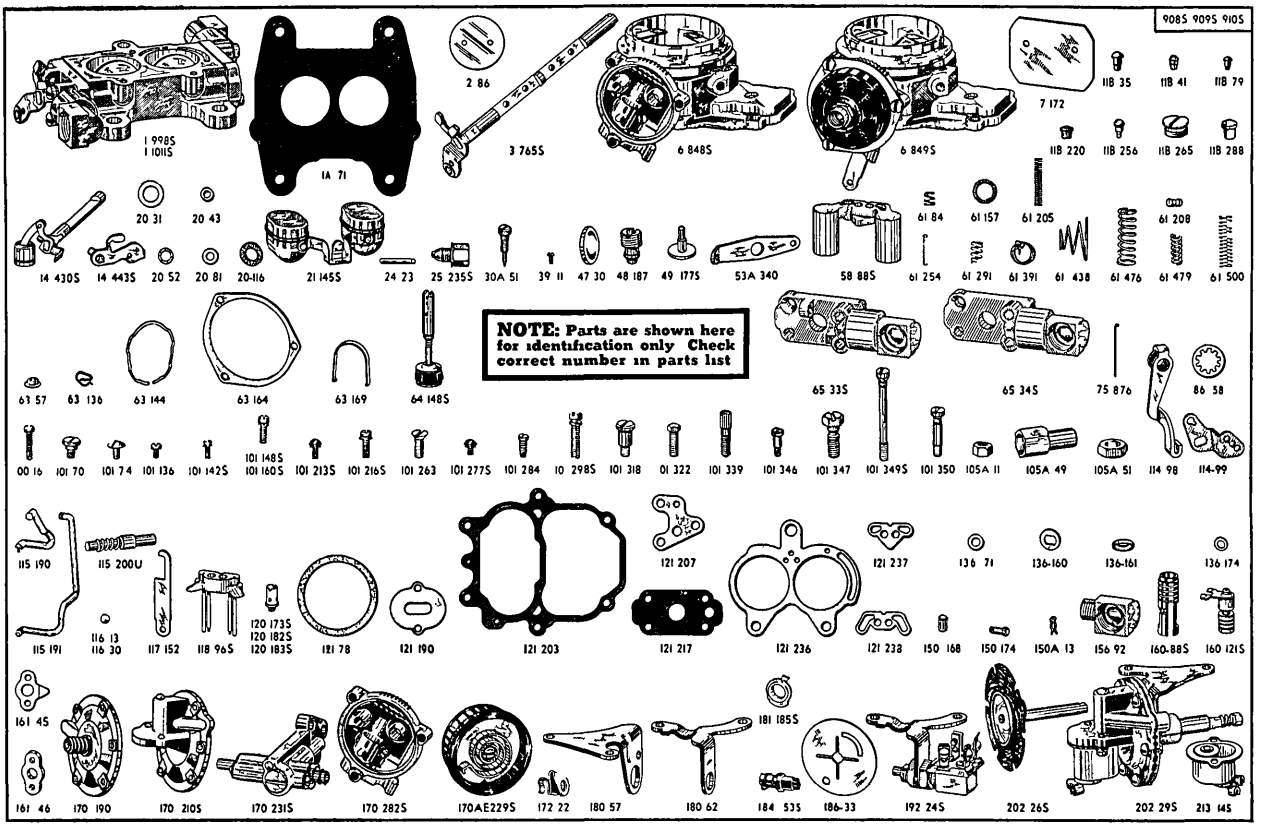
CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: This adjustment must be made with the bowl cover gasket and float pin retainer removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots. The distance from the top surface of the body casting to the top of each float should be 9/32 inch (gauge T109-239) for floats with flat top or 7/32 inch (gauge T109-239) for floats with curved top. If one float is lower than the other, equalize by bending the float arm. If both floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywhere against the inner walls of the bowl. If necessary, bend float arms slightly to provide clearance on all sides of floats.

PUMP ADJUSTMENT: Back out throttle adjusting screw and open choke valve so that throttle valves seat in bores of carbureter. Install pump connector rod in outer hole of throttle shaft arm and pump arm pin in top hole of the plunger shaft. The distance from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 57/64 inch. Adjust by bending pump connector rod at lower angle (use Tool T109-213).



FAST IDLE ADJUSTMENT: Remove thermostatic coil housing assembly, gasket and baffle plate. With throttle adjusting screw backed out, crack throttle valve and hold choke valve in fully closed position. Then close throttle. This will allow fast idle cam to revolve to fast idle position. There should now be .015″-.019″ clearance (use gauge T109-44) between throttle valve and bore of carbureter (side opposite idle port). Adjust by bending the choke connector rod at lower angle (use tool T109-213).

UNLOADER ADJUSTMENT: This adjustment must be made after the fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing. There should now be 1/4 inch clearance (use gauge T109-31) between upper edge of choke valve and inner wall of air horn. Adjust by bending arm on choke trip lever (use tool T109-214). When fast idle and unloader adjustments have been made, assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn. Set Climatic® Control at "Index", making sure that hook on coil has picked up coil shaft lever.

DASH POT (SLOW CLOSING THROTTLE) ADJUSTMENT: (908S ONLY) The purpose of the dashpot is to prevent the car from stalling when the throttle is released rapidly. Maximum dashpot action is obtained by adjustment of diaphragm adjusting screw so that the dashpot plunger shaft can be moved inward approximately 1/16 inch after engine and throttle have returned to normal idle. This adjustment should be made with the carbureter on the car, with engine running and transmission in driving range.

OVERDRIVE KICKDOWN SWITCH ADJUSTMENT: (910S ONLY) (1) With throttle valves seated in bores of carbureter and kickdown switch lever held against stop on switch bracket, bend lip on throttle lever until it just contacts kickdown lever. (2) With throttle valves in wide open position adjust hex nuts on switch to have 1/64 inch to 3/64 inch clearance between kickdown lever and switch stem guide.

NOTE: Figures in parentheses indicate number of pieces used in ne carbureter Where no figure is shown only one is used

This Carbureter also used on Chrysler "C-51" and "C-60" Cars equipped with Fluid Drive and M6 Transmission

DESOTO 6
MODELS S-15, S-18
(Fluid Drive or Torque Converter and M6 Transmission)
1951-1953

BB DOWN-DRAFT **CARBURETER No. E9A1**

CARBURETER SPECIFICATIONS

For DeSoto 6 Cylinder Engine: 3-7/16 Inch Bore, 4½ Inch Stroke

Dimensions: Flange size, 1½ inch S. A. E. Throttle bore, 1-11/16 inch (42.86 mm). Main venturi, 1-11/32 inch (34.13 mm) I. D.

Float Setting: Top of float 5/64 inch (1.98 mm) below top surface of carbureter body casting. Plus or minus 1/64 inch (.397 mm). (Gauge T109-50.)

Vents: Outside none. Inside balance vent tube in air horn, above choke valve.

Gasoline Intake Needle: No 44 (2.18 mm) drill in needle seat.

Idle Orifice Tube: Jet size, .0295 inch (.75 mm) drill. Idle passage air bleed, in air horn, size No 56 (1.18 mm) drill diameter. Restriction in body .0492 inch (1.25 mm) diameter

Idle Ports: Upper port Slot type: length .149 inch (3.78 mm), width .030 inch (.76 mm). Top of port located .118 to .122 inch (3.00 to 3.10 mm) above top edge of valve. Lower port size .053 to .057 inch (1.35 to 1.45 mm) drill. (For idle adjustment screw.)

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. With gear shift lever in neutral position, idle engine between 450 to 500 r.p.m.

Main Metering Screw: Calibrated to flow 315 to 319 cc per minute. (Do not gauge for size. If in doubt replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl). Size 0315 inch (.80 mm) drill.

Main Vent Tube: Side Holes, 4—.0354 inch diameter.

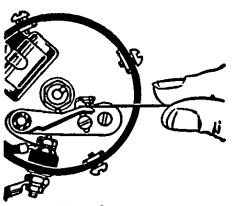
Step-Up Jet: Power orifice .0374 inch (.95 mm) drill.

Accelerating Pump: Type—delayed action, seasonal adjustment. Stroke—Summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke). Pump intake passage, ball check seat, size 107 to 112 inch (2.72 to 2.845 mm) diameter in body. Pump discharge passage. Restriction (under ball check) size .062 to .065 inch (1.57 to 1.65 mm) diameter in body. Pump (discharge) jet size, 0413 inch (1.05 mm) drill.

Pump Adjustment: None.

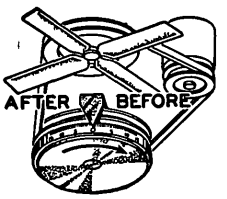
Choke: Carter Climatic® Control Set at Index. Choke heat suction hole, in flange insulator. Size No. 38 drill.

Slow Closing Throttle: Dash pot with discharge (by-pass), size .018 to .020 inch (.457 to 508 mm) drill, through valve cage

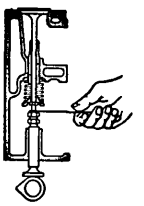


Vacuum Spark Port: Slot (round end) type; size .040 by .110 inch (1.016 by 2.794 mm). Top of port .012 to .018 inch (.305 to .0457 mm) above top edge of valve.

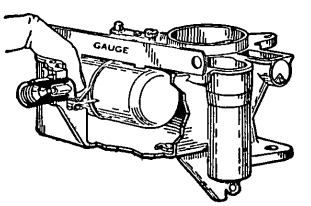
Motor Tune-Up—Be Accurate!



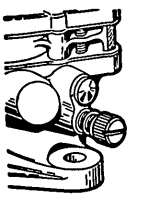
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open 2° B. T. D. C.

Valve Setting (Hot) Intake .008" Exhaust .010"

Float Setting 5/64 Inch ± 1/64 Inch (Use Gauge T109-50)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs 450-500 r.p.m., with gear shift lever in neutral position. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube passages with compressed air.

If acceleration is not satisfactory, remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. All jets must be seated gasoline tight. Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom or pump cylinder and discharge ball check in discharge passage. If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather.

Correct air fuel ratio is provided by a "balance tube" in the air horn. The balance tube should be checked each time the carbureter is serviced to see that the passage is open. The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner. Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed.

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube. After removal of rivet plug beneath float bowl with tool No. T109-43, main vent tube can be removed and a new tube inserted with tool No. T109-195. Care must be exercised in inserting new tube which must seat tightly. Use new rivet to complete the installation.

Pump Adjustment: No gauge is necessary. Pump lifter arm should be at a right angle to pump lifter shaft. Adjustment can be made by bending pump lifter arm up or down (use tool T109-41).

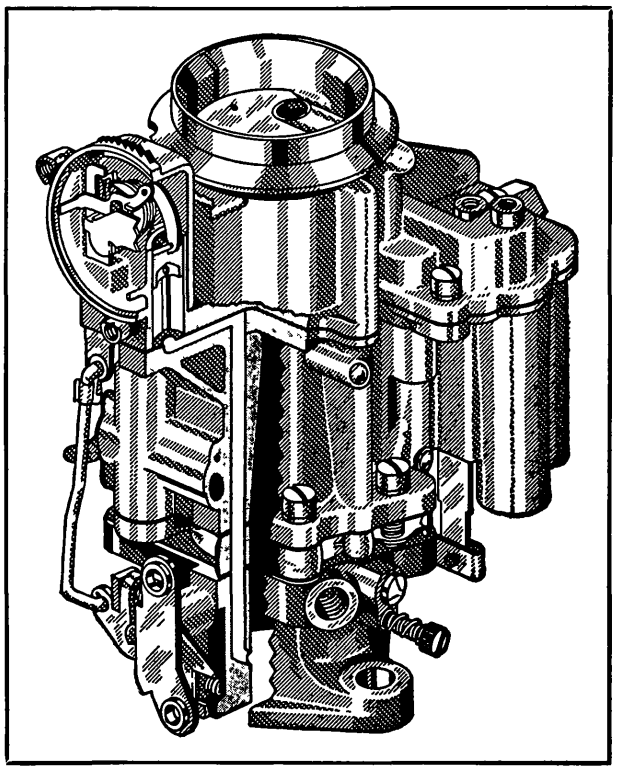

Figure 1

CARTER CLIMATIC® CONTROL CHOKE

The Carter Climatic® Control principle used in this unit is essentially the same as that used in WE type Carter carbureters. The fast idle cam assembly, unloader mechanism, etc., are located in the Climatic® Control housing. In this way all these parts are protected from dirt and other foreign matter (Fig. 1).

However, two important changes have been made (Fig. 2). Hot air is introduced at the **center** of the Climatic® Control housing, is drawn through three passages in the housing, around the delayer plate to the thermostatic coil, and then to the manifold.

A **delayer plate** has been added to control the action of the choke, providing longer choke operation during warm-up and preventing the choke from closing too rapidly after the engine is shut off. It should not be necessary to remove the delayer plate and thermostatic coil assembly from the coil housing when servicing the choke. The thermostatic coil **must not** be removed from the delayer plate.

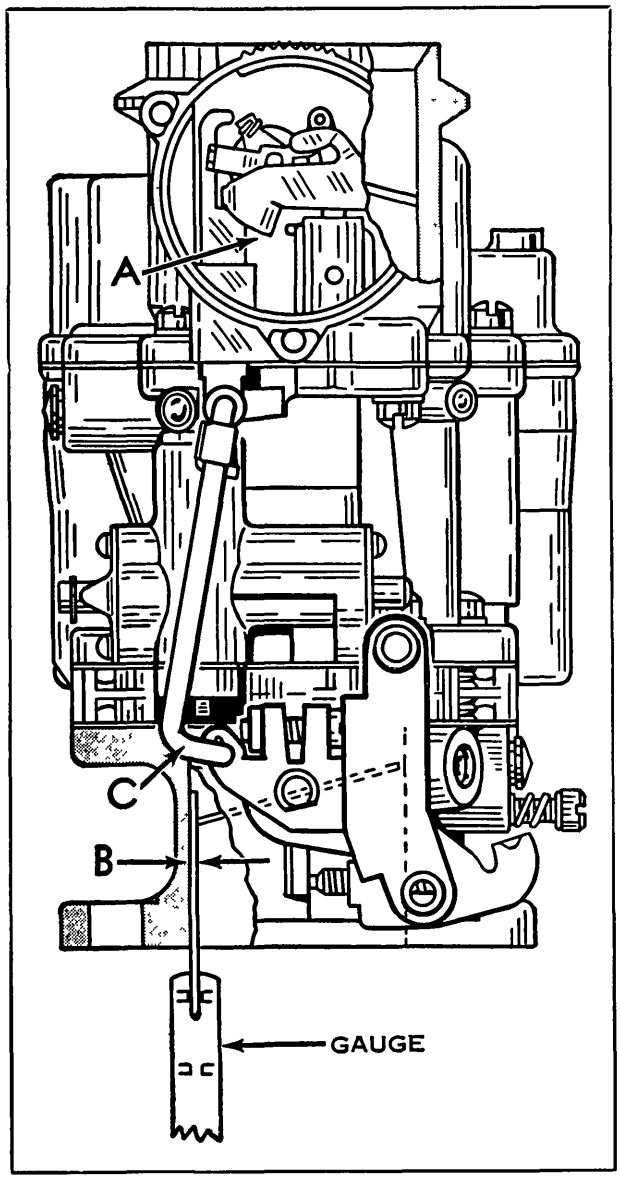

Figure 3
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 3):

Remove thermostatic coil housing assembly, gasket and baffle plate. With throttle adjusting screw backed out, crack throttle valve and hold choke valve in fully closed position. Then close throttle. This will allow fast idle cam to revolve to fast idle position ("A"—Fig. 3) There should now be .015"-.019" clearance ("B") (use gauge T109-44) between throttle valve and bore of carbureter, side opposite idle port. Adjust by bending the choke connector rod at lower angle ("C") (use tool T109-41).

UNLOADER ADJUSTMENT (Fig. 4):

This adjustment must be made after the fast idle adjustment Hold throttle valve wide open and close choke valve as far as possible without forcing. There should now be 5/32" clearance ("D"—Fig. 4) (use gauge T109-154) between upper edge of choke valve and inner wall of air horn. Adjust by bending arm on choke trip lever ("E"—Fig 4) (use tool T109-187). When fast idle and unloader adjustments have been made assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn Set Climatic® Control at "Index", making sure that hook on coil has picked up coil shaft lever

CARBURETER ADJUSTMENTS

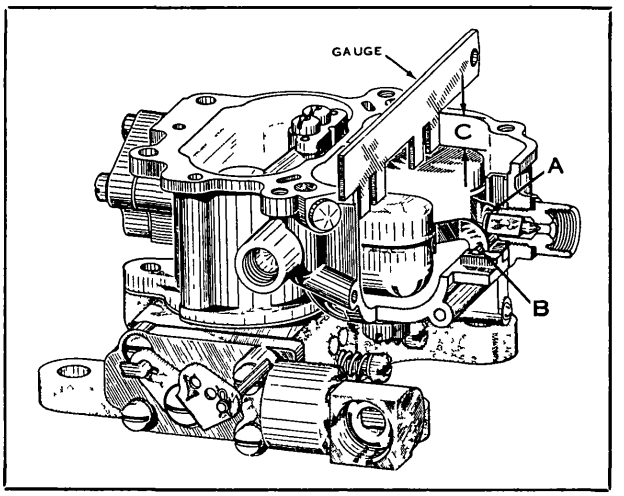

Figure 1
Float Adjustment

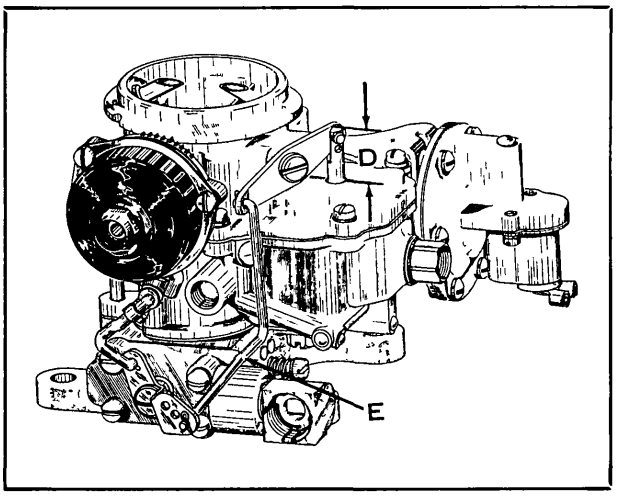

Figure 2
Pump Adjustment

FLOAT ADJUSTMENT (Fig. 1):

This adjustment must be made with the bowl cover gasket and float pin retainer removed Hold the lip (A) on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots (B). The distance (C) from the top surface of the body casting to the top of each float should be 5/16 inch (gauge T109-230 plus 1/32 inch). If one float is lower than the other, equalize by bending the float arm. It both floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywhere against the inner walls of the bowl. If necessary, bend float arms slightly to provide clearance on all sides of floats.

PUMP ADJUSTMENT (Fig. 2):

(EARLY PRODUCTION—CODE DATE "G2" AND EARLIER). With throttle valves in wide open position and pump connector rod in center of hole of throttle shaft arm, the distance from the top of the bowl cover to the top of the plunger shaft (not pump arm) should be 33/64 inch. (Use gauge T109-230 held in vertical position.) Adjust by bending connector rod at lower angle (E) (use tool T109-213) (LATE PRODUCTION—CODE DATE "H2" AND LATER USING 64-148S PLUNGER AND ROD ASSEMBLY. IDENTIFY BY 2 HOLES THROUGH PLUNGER SHAFT.) Back out throttle adjusting screw and open choke valve so that throttle valves seat in bores of carbureter Install pump connector rod in outer hole of throttle shaft arm and pump arm pin in top hole of the plunger shaft. The distance (D) from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 57/64 inch. Adjust by bending pump connector rod at lower angle (E) (use tool T109-213)

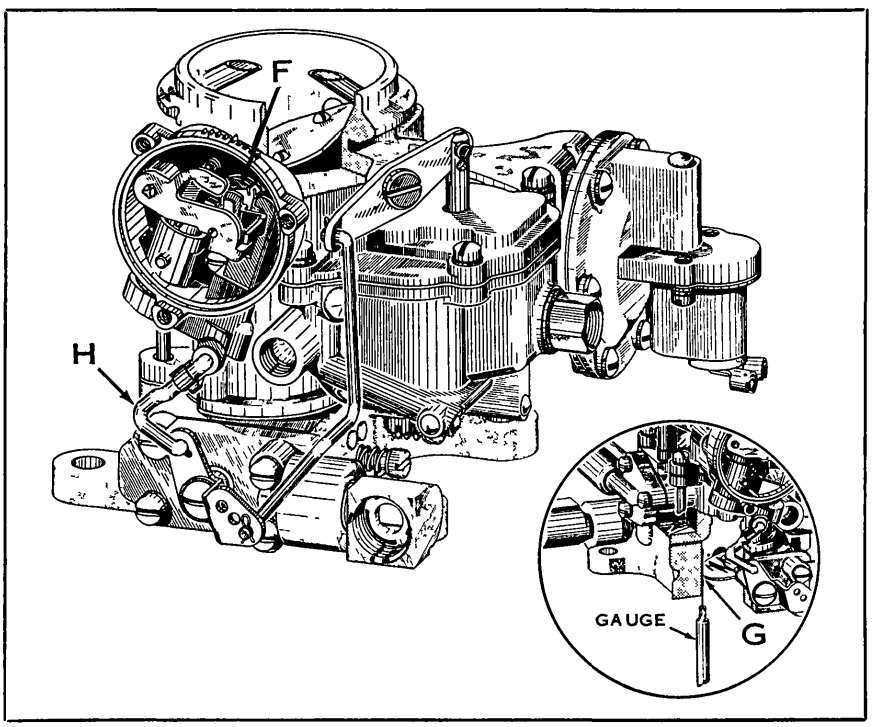

Figure 3
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 3):

Remove thermostatic coil housing assembly, gasket and baffle plate. With throttle adjusting screw backed out, crack throttle valve and hold choke valve in fully closed position. Then close throttle. This will allow fast idle cam (F) to revolve to fast idle position. There should now be .015"-.019" clearance (G) (use gauge T109-44) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle (H) (use tool T109-213).

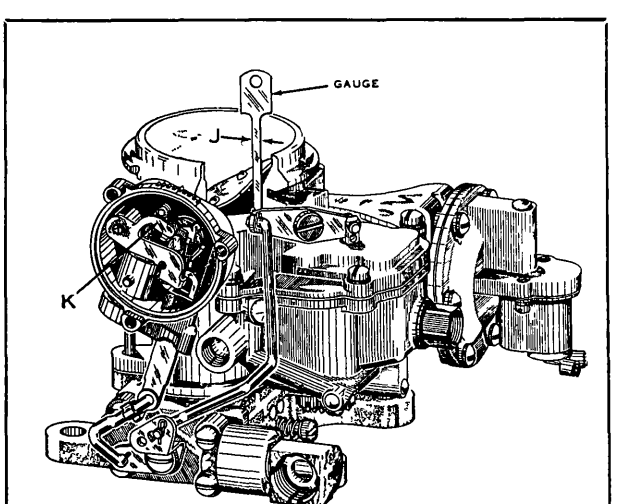

Figure 4
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 4):

This adjustment must be made after the fast idle adjustment. Hold throttle valves wide open and close choke valve as far as possible without forcing. There should now be 1/4 inch clearance (J) (use gauge T109-31) between upper edge of choke valve and inner wall of air horn. Adjust by bending arm (K) on choke trip lever (use tool T109-214). When fast idle and unloader adjustments have been made, assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn Set Climatic® Control at 'Index", making sure that hook on coil has picked up coil shaft lever.

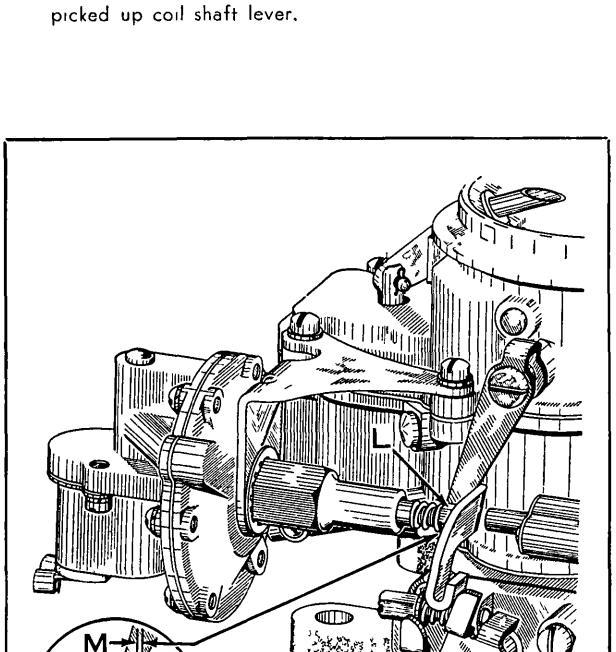

Figure 5
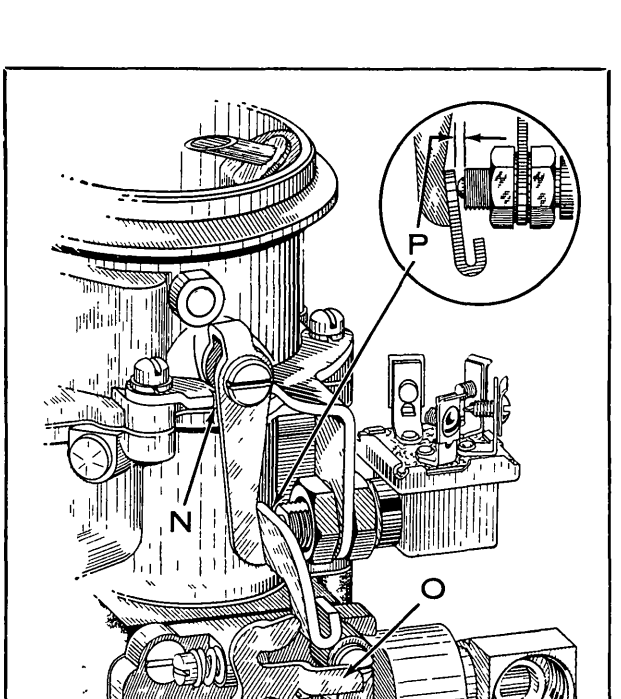
Dashpot Adjustment

DASHPOT (SLOW CLOSING THROTTLE ADJUSTMENT) (901S ONLY) (Fig. 5):

The purpose of the dashpot is to prevent the car from stalling when the throttle is released rapidly. Maximum dashpot action is obtained by adjustment of diaphragm adjusting screw (L) so that the dashpot plunger shaft can be moved inward approximately 1/16 inch (M) after engine and throttle have returned to normal idle. This adjustment should be made with the carbureter on the car, with engine running and transmission in driving range.



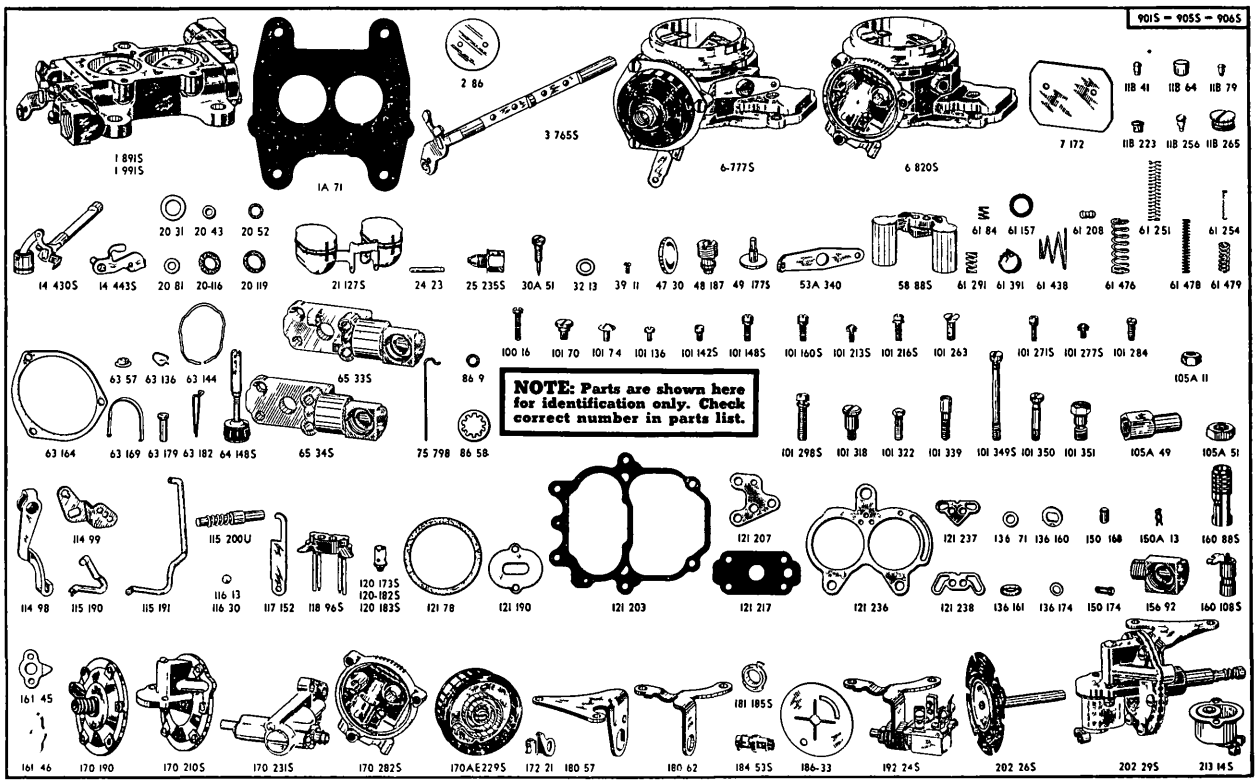


Figure 6
Overdrive Kickdown Switch Adjustment

OVERDRIVE KICKDOWN SWITCH ADJUSTMENT (906S ONLY) (Fig. 6):

(1) With throttle valves seated in bores of carbureter and kickdown switch lever held against stop (N) on switch bracket, bend lip (O) on throttle lever until it just contacts kickdown lever. (2) With throttle valves in wide open position adjust hex nuts on switch to have 1/64 inch to 3/64 inch clearance (P) between kickdown lever and switch stem guide.

160-108S	STEP UP PISTON AND PLATE ASSEMBLY	
161-45	Terminal end plate (901S)	
161-46	Push rod end plate (901S)	
170-190	Diaphragm housing (inner) (901S)	
170-210S	Dash pot diaphragm outer housing assembly (901S)	
170-231S	Kickdown switch assembly (complete) (901S)	
170-282S	Piston housing and plug assembly	
170AE229S	Thermostatic coil and housing assembly (Sup by 170AE320SU)	
170AE320S	Thermostatic coil and housing assembly	
170AE320SU	Unitized package (Consists of 1—170AE320S 1—63 190 3—101 361 and 1—121 78)	
172-21	CHOKE CONNECTOR ROD RETAINER	
180-57	Dash pot mounting bracket (901S)	
180 62	Kickdown switch bracket (906S)	
181-185S	Fast idle cam assembly	
184-53S	Terminal block and retainer clip assembly (901S)	
186-33	Choke baffle plate	
192-24S	Kickdown switch and bracket assembly (complete) (906S) (Sup by 192 34U)	
192-34U	Unitized package (906S)	
202-26S	Diaphragm shaft and retainer assembly (901S)	
202-29S	Dashpot unit (complete) (901S)	
213 14S	Electro magnet and housing assembly (901S)	

*Part of 64 149U Unitized Package

**64 149U Unitized Package is to be used for modification of early production carbureters

NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown only one is used

CARTER CARBURETOR CORPORATION, ST. LOUIS, MO., U. S. A.

DE SOTO "V-8"
MODEL S-17
1952

WCD Down-Draft Climatic® Control **Carbureters Nos. 884S-884SA-884SC**

CARBURETER SPECIFICATIONS

For DeSoto 8 Cylinder Engine: 3⅝ Inch Bore, 3-11/32 Inch Stroke

Dimensions: Flange size 1¼ inch (37.75 mm) dual, 4 bolt (water jacket) type.
Throttle bore, 1-7/16 inch (36.51 mm).
Primary venturi, 11/32 inch, (8.73 mm) I. D.
Main venturi, 1⅛ inch, (30.16 mm) I. D.

Float Level: See adjustments.

Vents: Inside; balance vent tube to bowl, in air horn, above choke valve. Outside; none.
Vent to kickdown switch, in air horn, on automatic choke side.

Gasoline Intake: Size No. 38 (.1015 inch) (2.58 mm) drill hole in needle seat.

Low Speed Jet Tube: Jet size .0295 inch (.75 mm) drill. By-pass, size No. 58 (.042 inch) (1.07 mm) drill. Economizer, size .0452 inch (1.15 mm) drill. Idle bleed, size No. 58 (.042 inch) (1.07 mm) drill.

Idle Port: Upper port; length .175 inch (4.45 mm), width .030 inch (.76 mm).

Idle Port Opening: .136 to .140 inch (3.46 to 3.56 mm) above upper edge of valve with valve tightly closed.

Lower Ports (for Idle Adjustment Screws): Size .0615 to .0655 inch (1.56 to 1.66 mm) diameter.

Set Idle Adjustment Screw: ½ to 1 turn open. For richer mixture, turn screw out. With gear shift lever in neutral position idle engine between 475 to 500 R. P. M.

Main Nozzle: Nozzles are installed permanently. **Do Not Remove.**

Metering Rod: Vacumeter type. Economy step .0665 inch (1.69 mm) diameter. Middle step tapers to .061 inch (1.55 mm) diameter. Power step, .057 inch (1.42 mm) diameter.

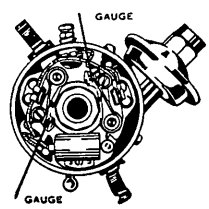
Metering Rod Jet: .086 inch (2.18 mm) diameter.

Metering Rod Setting: See adjustments.

Accelerating Pump: Pump discharge jets: (twin) size (.0315 inch) drill. Intake ball check seat, size No. 32 (.116 inch) drill. Discharge needle seat, size No. 50 (.070 inch) drill.

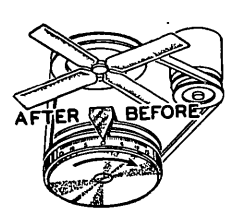
Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control—set at index. Butterfly type, offset valve. Choke heat suction hole, in bowl cover, size No. 43 (.089 inch) (2.26 mm) drill.

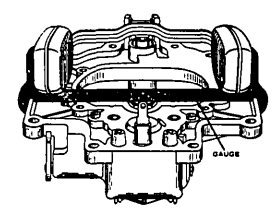


Vacuum Spark Port: .030 x .110 inch (.76 x 2.80 mm). Top of port to be .035 to .041 inch (.89 to 1.04 mm) above top edge of valve.

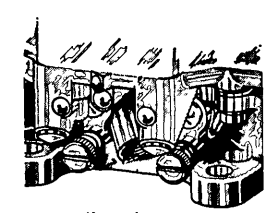
Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting .013"-.018"

Ignition Timing Breaker Points to Open: 4° B. T. D. C.

Float Setting 11/64" (Use Gauge T109-205)

Idle Adjustment Screw Setting ½ to 1 Turn Open

NOTE: These cars equipped with hydraulic valve lifters.—No adjustment.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT (Fig. 1):

Two separate float adjustments must be made—lateral and vertical

Lateral Adjustment With bowl cover assembly inverted bowl cover gasket removed and lip of float resting on seated needle, place float gauge T109-205 directly under float with notched portions of gauge fitted over edges of casting Sides of floats should barely touch the vertical uprights of float gauge (A) Adjustment should be made by bending arms of floats

Vertical Adjustment: With float gauge in position shown floats should just clear the horizontal portion of gauge (B) Vertical distance between top of float and machined surface of casting should be 11/64 inch (gauge T109 205) Adjustment can be made by bending arms of floats Carefully remove float assembly, install bowl cover gasket and then reinstall float assembly A fast check of the fuel level can be made on the car by removing the inspection hole plug in the side of carbureter body Fuel should just run out of the hole with engine idling

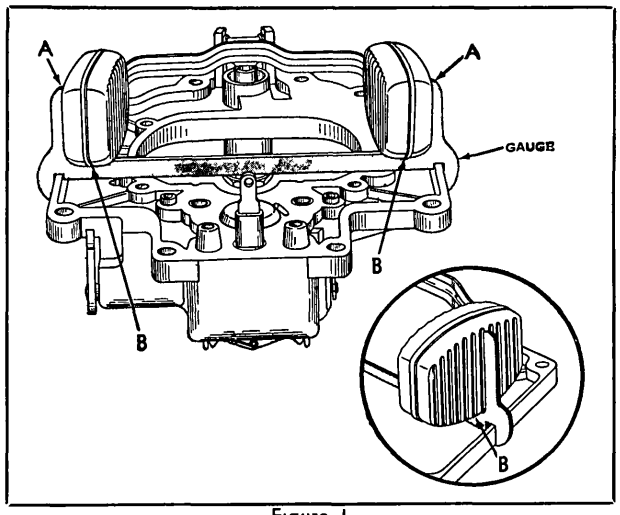

Figure 1
Float Adjustment

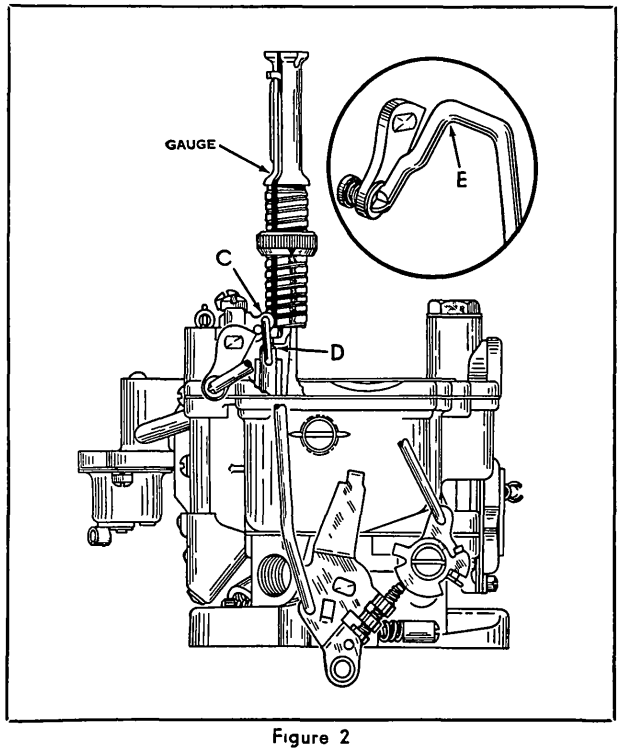

Figure 2
Pump Adjustment

PUMP ADJUSTMENT (Fig 2).

The total distance the plunger head (not shaft) moves from closed to wide open throttle position determines the amount of fuel discharged Correct pump plunger travel is important and should be checked each time the carbureter is disassembled or when leaner than standard metering rods are installed Procedure is as follows

Install pump connector link in outer hole (long stroke) of pump arm (C) Back out throttle lever set screw until throttle valves seat in bores of carbureter Be sure fast idle adjustment screw does not hold throttle open With air horn assembly removed place Universal pump travel gauge T109-117S, inverted on edge of dust cover boss of bowl cover Turn knurled nut of gauge until finger just touches upper end of plunger shaft (D) Number indicated on gauge should be 33 Hold the gauge vertical to insure correct reading Adjust by bending throttle connector rod at upper angle (E) (Use tool T109 213)

Optional Adjustment· With throttle valves seated in bores of carbureter the distance from the top of the plunger shaft to the top of the dust cover boss should be 23/64" Adjust as mentioned above

METERING ROD ADJUSTMENT (Fig. 3):

Metering rod adjustment is important and must be made after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows

Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (F) With metering rods in place, press down on vacumeter link (G) until metering rods bottom in carbureter body casting (H) Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter hnk (J). Hold in place and carefully tighten clamp screw (F).

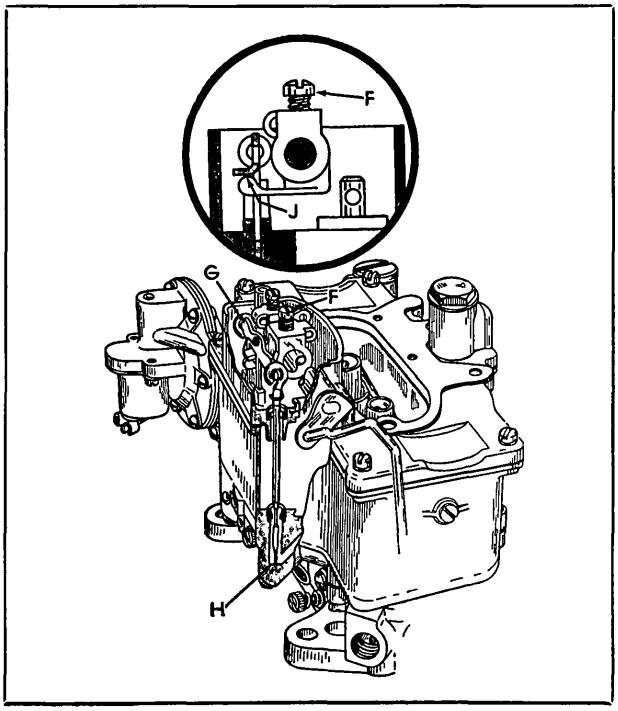

Figure 3
Metering R d Adjustment

FAST IDLE ADJUSTMENT (Fig. 4):

1. Loosen choke lever clamp screw (K) on choke shaft. Insert .040" feeler gauge T109-193 between lip of fast idle cam and boss of flange casting (L). Hold choke valve tightly closed and take slack out of linkage by pressing choke lever toward closed position — hold in place and tighten clamp screw (K).

2. With choke valve tightly closed, tighten fast idle adjusting screw (M) until there is .017"-.021" opening (N) (wire gauge T109-44 may be used) between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam (O) while making this adjustment.

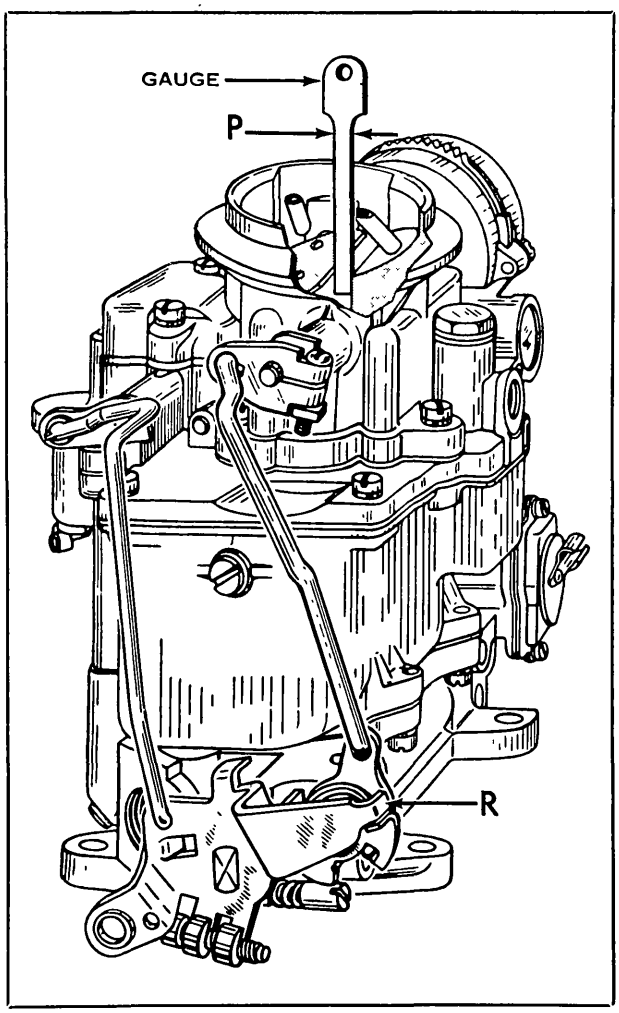

Figure 5
Unloader Adjustment

DASHPOT (SLOW CLOSING THROTTLE) ADJUSTMENT (Fig. 6):

The purpose of the dashpot is to prevent the car from stalling when the throttle is released rapidly. Maximum dashpot action is obtained by adjusting screw (S) so that the dashpot plunger shaft (T) can be moved inward approximately 1/16" after engine and throttle have returned to normal idle. This adjustment should be made with the carbureter on the car, with engine running and transmission in driving range.

Service parts and complete unit assemblies are available for servicing the dash p t and kickdown switch units pictur d in Fig. 6.

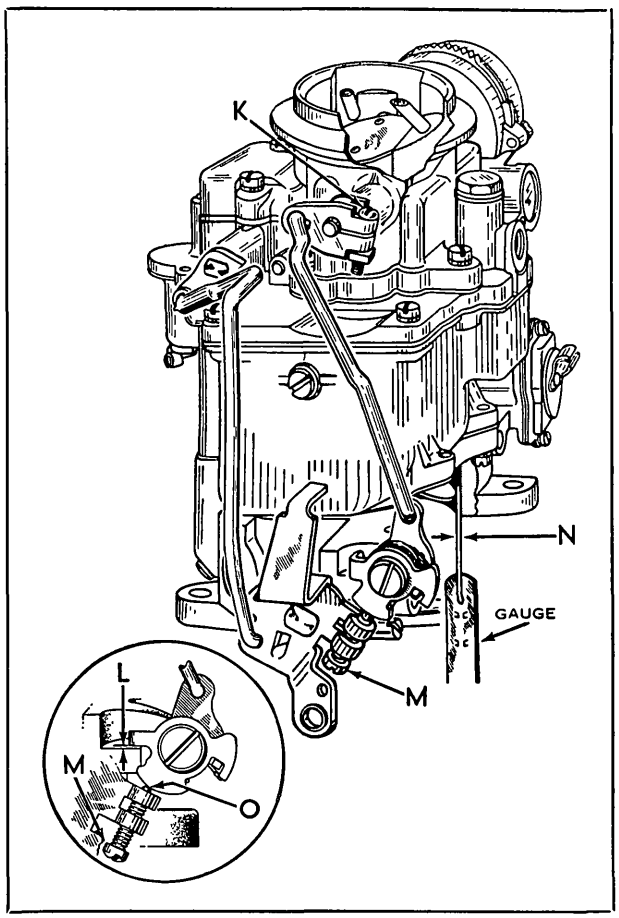

Figure 4
Fast Idle Adjustment

UNLOADER ADJUSTMENT (Fig. 5):

With throttle wide open there should be 7/32" clearance between upper edge of choke valve and inner wall of air horn (P) (gauge T109-106). Adjust by bending unloader lip on throttle shaft lever (R) (use bending tool T109-41).

13 Delayer plate gasket
14 Delayer plate retainer ring
15 Delayer plate and thermostatic coil assembly

The Carter Climatic® Control principle used in this unit is essentially the same as that used in other WCD carbureters However heat is introduced at the center of the thermostatic coil housing. Hot air is drawn through three passages in the coil housing through the center of the delayer plate and then to the manifold

The purpose of the delayer plate is to control the action of the choke providing longer choke operation during warm up and prevent ing the choke from closing too rapidly after the engine is shut off Should it be necessary to replace the delayer plate gasket, the delayer plate and thermostatic coil assembly may be removed by striking the coil housing assembly sharply against the cupped palm of the hand Care should be taken during removal and reassembly to avoid damage to the thermostatic coil The thermostatic coil **must not** be removed from the delayer plate

101-302	THROTTLE VALVE ATTACHING SCREW	(4)
101-307S	Dashpot bracket attaching screw and washer assembly	(2)
101-323	Fast idle cam attaching screw	
101-327	Thermostatic coil housing attaching screw (Use with 170AC206S)	(2)
101-342	Pump jet housing attaching screw

B-B DOWN-DRAFT CARBURETERS—**MODELS E7L1-L2-L3-L4**

CARBURETER SPECIFICATIONS

For De Soto Six Cylinder Engine: 3-7/16 Inch Bore, 4¼ Inch Stroke

Dimensions: Flange size, 1½ inch (38.1 mm). Throttle bore, 1-11/16 inch (42.86 mm). Main venturi, 1-11/32 inch (34.13 mm) I. D.

Float Setting: Top of float 5/64 inch (1.98 mm) below top surface of carbureter body casting. Plus or minus 1/64 inch (.397 mm).

Vents: Outside none. Inside balance vent tube .218 inch diameter (5.54 mm).

Gasoline Intake Needle: Triangular, horizontal No. 44 (2.18 mm) drill in needle seat.

Idle Orifice Tube: Jet size, .0276 inch (.70 mm) drill. (E7L1) Idle passage air bleed, in air horn, size .0531 inch (1.35 mm) diameter. Restriction in body, size .0531 inch (1.35 mm) diameter. (E7L2-L3-L4) Idle passage air bleed, in air horn, size No. 56 (1.18 mm) drill diameter. Restriction in body .0452 inch (1.15 mm) diameter.

Idle Ports: Upper port. Slot type: length .149 inch (3.78 mm), width .030 inch (.76 mm). Top of port located .118 to .122 inch (3.00 to 3.10 mm) above top edge of valve. Lower port size .053 to .057 inch (1.35 to 1.45 mm) drill. (For idle adjustment screw).

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. With gear shift lever in neutral position, idle engine between 450 and 500 r.p.m.

Main Metering Screw: Calibrated to flow 315 to 319 cc per minute. (Do not gauge for size. If in doubt replace with new part.)

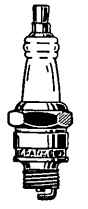
Main Vent: Through diffuser (air bleed inside bowl). Size .0315 inch (.80 mm) drill.

Main Vent Tube: Side Holes, 4—.0354 inch diameter.

Step-Up Jet: Power orifice .0413 inch (1.05 mm) drill.

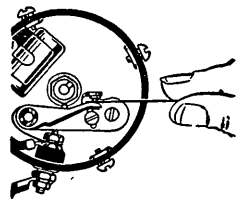
Accelerating Pump: Type—delayed action, seasonal adjustment. Stroke—Summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke).
Pump intake passage ball check seat, size .115 to .120 inch (2.93 to 3.05 mm) diameter in body. Pump discharge passage: Restriction (under ball check) size .062 to .065 inch (1.57 to 1.65 mm) diameter in body. Pump (discharge) jet size, (E7L1-L2) .0334 inch (.85 mm) drill. Pump (discharge) jet size, (E7L3-L4) .0413 inch (1.05 mm) drill.

Pump Adjustment: (E7L1-L2) 20/64 inch plunger travel—full throttle position, medium stroke. Use gauge T109-117S. (E7L3-L4) None.



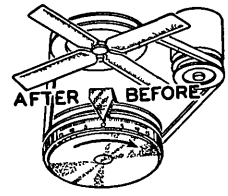
Choke: Offset butterfly type (with poppet valve) interconnected to open throttle valve to fast idle position when choke is used.

Slow Closing Throttle: Dash pot with discharge (By-pass), size .018 to .020 inch (.457 to .508 mm) drill, through valve cage.

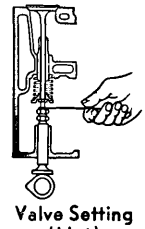


Vacuum Spark Port: Slot (round end) type; size .040 by .110 inch (1.016 by 2.794 mm). Top of port .052 to .058 inch (1.32 to 1.47 mm) above top edge of valve (early production); .012 to .018 inch (.305 to .457 mm) above top edge of valve (late production).

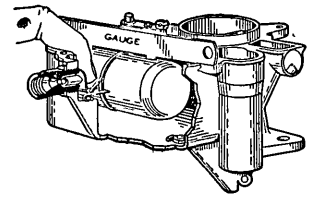
Motor Tune-Up—Be Accurate!



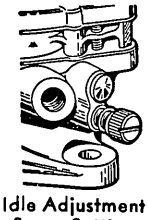
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .038"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open T. D. C.

Valve Setting (Hot) Intake .008" Exhaust .010"

Float Setting (Use Gauge) 5/64 Inch

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs 450-500 r. p. m., with gear shift lever in neutral position. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube passages with compressed air.

If acceleration is not satisfactory, remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. All jets must be seated gasoline tight. Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage. If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather.

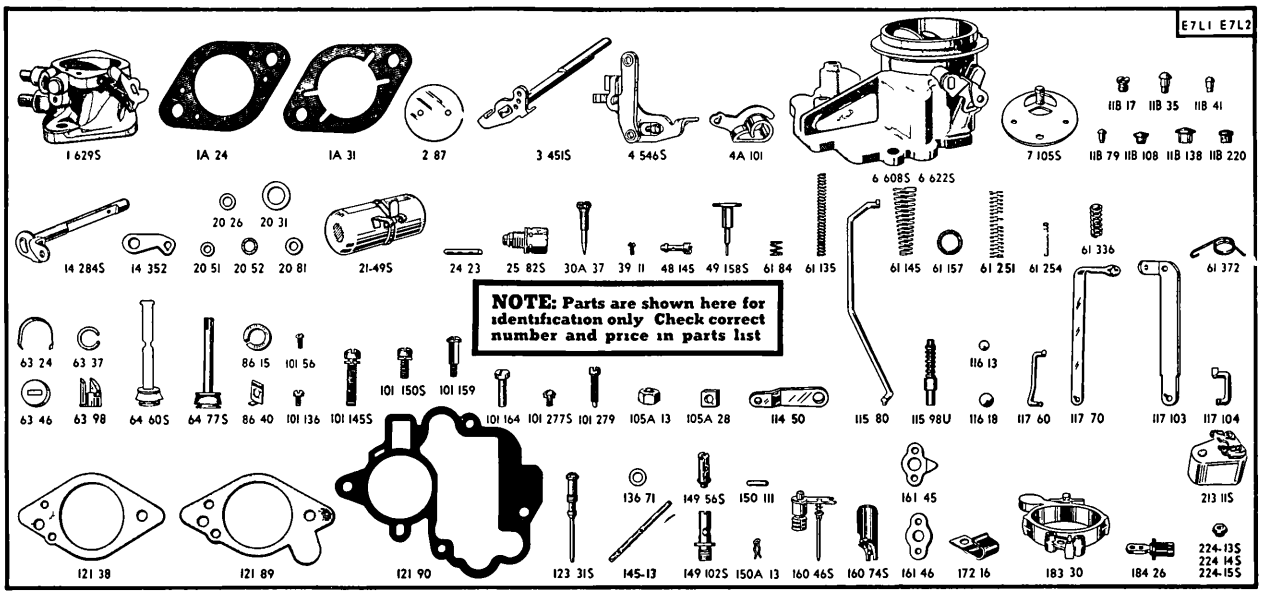
CARBURETER

TRADE MARK REG. U. S. PAT. FF.
MARCA REGISTRADA

PRINTED IN U.S.A.



Correct air fuel ratio is provided by a "balance tube" in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43, main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment. (E7L1-L2) Remove air horn assembly back out throttle adjustment screw, and place pump operating link in center hole of throttle shaft arm Place gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft Turn knurled nut of gauge until lip contacts plunger shaft at closed and wide open throttle positions Difference in readings should be "20 ' 20/64 inch plunger travel

(E7L3-L4) No gauge is necessary Be sure pump lifter link arm is at right angle to lifter link shaft Adjustments can be made by bending horizontal portion of pump lifter link

Pump stroke adjustable for high or low temperature Set to long stroke for cold weather, short stroke for hot weather driving
